PHYSICS ABSTRACTS

Physics Abstracts is one of a series of abstracts publications produced by INSPEC. Published twice monthly by the Institution of Electrical Engineers, it forms the world's major English-language abstracting service for the physics community.

SUBJECT SCOPE & COVERAGE

Physics Abstracts covers the whole field of physics. An impression of its scope can be gained from the classification scheme. The information contained in *Physics Abstracts* is derived from a wide range of sources including journals, reports, books, dissertations and conference papers published in all countries and languages of the world.

The number of items included is currently running at over 100,000 per year.

JOURNALS SCANNED

A list of the journals scanned for the INSPEC services is published with the twice-yearly author indexes to *Physics Abstracts*. Additions and amendments to this list are included in *Physics Abstracts* towards the end of the first issue for each month.

FORM OF ENTRY

All entries in *Physics Abstracts* follow the same basic pattern. The following example identifies the individual parts of a typical entry for an article from a journal.

Entry No. in PA ↓ **Title of paper** ↓

87093 PAC study of molecular rotational motions in dilute solutions.
Authors → A.Baudry, P.Boyer, J.D.Fabris, P.Vulliet (Lab. d'Interactions Hyperfines, CENG, Grenoble, France). ← **Author's affiliation**
Source of paper → *Hyperfine Interactions (Netherlands)*, vol.10, no.1-4, p.1057-62 (June 1981). (Proceedings of the Fifth International Conference on Hyperfine Interactions, Berlin, Germany, 21-25 July 1980).
The rotational tumbling of neutral chelates of hafnium dissolved in several organic solvents was studied via ^{181}Ta DPAC experiments. The results are compared with the predictions of a hydrodynamic model with partial slip boundary conditions. The influence of solute-solvent interactions and/or associations on the quadrupole relaxation is discussed. (16 refs.) } **Abstract**

Entries for other types of material differ mainly in the reference to the source, e.g., a report will refer to the report series and the number of the individual report. A conference paper on the other hand will normally refer to the title, place and date of the conference at which the paper was given.

SUBJECT ARRANGEMENT & SUBJECT GUIDE

The abstracts are arranged by subject in accordance with the scheme in the CLASSIFICATION and CONTENTS which appears opposite. The page number for the start of each subject section is given. An alphabetical index to the scheme—the SUBJECT GUIDE—follows the CLASSIFICATION and CONTENTS.

SUBJECT INDEXES

Detailed twice-yearly subject indexes to the individual entries are provided separately, covering the periods January-June and July-December. In these SUBJECT INDEXES each major concept occurring in each paper abstracted is indexed under headings drawn from the INSPEC Thesaurus.

AUTHOR INDEX

At the end of each issue, an alphabetical index of authors is provided showing the entry number of the items written by them. These indexes are cumulated every six months and, with the addition of the title of the individual papers, are published separately to cover the periods January-June and July-December of each year.

SUBSIDIARY INDEXES

Where appropriate, the following subsidiary indexes are included for the convenience of users:

Bibliography index of articles where a significant list of references or bibliography is contained.

Book index of books received and abstracted.

Corporate Author index where a corporate organisation rather than an individual is responsible for publication. This index includes all reports.

Conference index with reference to individual papers.

Subscription prices and ordering procedure are shown on the inside back cover.

PHYSICS ABSTRACTS is published twice monthly by the Institution of Electrical Engineers in association with the Institute of Electrical and Electronics Engineers Inc. Printed by Unwin Brothers Limited, The Gresham Press, Old Woking, Surrey. 2nd Class postage paid at Piscataway, N.J. 08854, USA. POSTMASTER: Send address changes to INSPEC/IEEE SERVICE CENTER, 445 Hoes Lane, Piscataway, N.J. 08854.

Physics Abstracts

CLASSIFICATION AND CONTENTS

The abstracts are arranged by subject in accordance with the following scheme. The page number for each section is given. The CLASSIFICATION AND CONTENTS is followed by an alphabetical guide to the scheme, the SUBJECT GUIDE.

The classification scheme is the result of cooperation between INSPEC, the American Institute of Physics, the European Physical Society and the Physics Working Group of the ICSU-AB.

3280B *Level crossing and optical pumping* 5666
3280D *Autoionization* 5666
3280F *Photoionization and photodetachment* 5666
3280H *Auger effect and inner-shell ionization* 5666
3280K *Multiphoton processes* 5666
3290 Other topics in atomic spectra and interactions with photons —

3300 MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS 5666
3310 Calculation of molecular spectra 5666
3320 Molecular spectra grouped by wavelength ranges 5668
3320B *Radiofrequency and microwave spectra* 5668
3320E *Infrared spectra* 5668
3320F *Raman and Rayleigh spectra* 5670
3320K *Visible spectra* 5671
3320L *Ultraviolet spectra* 5671
3320N *Vacuum ultraviolet spectra* 5671
3320R *X-ray spectra* 5672
3325 Nuclear magnetic resonance and relaxation; nuclear quadrupole resonance (NQR) 5672
3330 Electron paramagnetic resonance and relaxation 5673
3335 Double resonances and other multiple resonances 5673
3335H *MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)* —
3340 Mössbauer spectra —
3345 Magneto-optical and electro-optical spectra; dichroism 5674
3345B *Zeeman and Stark effects* 5674
3345C *Magnetic circular dichroism* 5674
3350 Fluorescence, phosphorescence; radiationless transitions (intersystem crossing, internal conversion) 5674
3365 Photoelectron spectra 5675
3370 Intensities and shapes of molecular spectral lines and bands 5676
3380 Photon interactions with molecules 5676
3380B *Level crossing and optical pumping* 5676
3380E *Autoionization, photoionization, and photodetachment* 5677
3380G *Diffuse spectra; predissociation, photodissociation* 5677
3380K *Multiphoton processes* 5678
3390 Other topics in molecular spectra and interactions with photons —

3400 ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS 5678
3410 General theories and models 5678
3420 Interatomic and intermolecular potentials and forces 5678
3440 Elastic scattering of atoms and molecules 5679
3450 Inelastic scattering of atoms and molecules 5679
3450E *Rotational and vibrational energy transfer* 5679
3450H *Electronic excitation and ionization (inc. beam-foil excitation and ionization)* 5680
3450L *Chemical reactions, energy disposal, and angular distribution, as studied by atomic and molecular beams* 5680
3470 Charge transfer 5680
3480 Electron scattering 5681
3480B *Elastic scattering of electrons by atoms and molecules* 5681
3480D *Atomic excitation and ionization by electron impact* 5681
3480G *Molecular excitation, ionization, and dissociation by electron impact* 5682
3490 Other topics in atomic and molecular collision processes and interactions 5682

page
3500 PROPERTIES OF ATOMS AND MOLECULES; INSTRUMENTS AND TECHNIQUES 5682
3510 Atoms 5682
3510B *Atomic masses, mass spectra, abundances, and isotopes* 5682
3510D *Electric and magnetic moments, polarizability* 5682
3510F *Relativistic corrections, fine- and hyperfine-structure constants* 5682
3510H *Ionization potentials, electron affinities* 5683
3510W *Weak Interactions* —
3520 Molecules 5683
3520B *General molecular conformation and symmetry; stereochemistry* 5683
3520D *Interatomic distances and angles* 5683
3520G *Bond strengths, dissociation energies, hydrogen bonding, etc* 5683
3520J *Barrier heights (internal rotation, inversion); rotational isomerism, conformational dynamics* 5683

SUBSIDIARY INDEXES

SUBJECT GUIDE

The SUBJECT GUIDE is an alphabetical index to subjects covered in the classification scheme, by which the abstracts are arranged. The numbers given are classification codes. The CLASSIFICATION AND CONTENTS, which precede the Guide, gives the page number for each section.

Classification
A mesons 1440
Ab initio calculations 3120
Aberrations 4180, 4230, 4278
Abrasion 4630P, 6220P, 8140P
Absorptive models 1240P
Acceleration measurement 0630G
Accumulation layers 7320, 7340Q
Acoustic devices 4385
Acoustic holography 4363
Acoustic noise 4350, 4360, 4388, 8670J
Acoustic nuclear magnetic resonance 7660
Acoustic paramagnetic resonance 7630
Acoustic properties of gases 5140
Acoustic properties of liquids 6260
Acoustic properties of solids 6265
Acoustic signal processing 4360
Acoustic wave propagation 4320, 4325, 5140, 6260, 6265
Acoustics 43
Acousto-optical effects 5140, 5170, 7820H
Acoustoelectric effects 4388, 5140, 5150, 7250
Adaptive optics 42
Adherence 4630P
Adhesion 4630P, 6825, 8190
Adsorption 6845, 8265
Aerodynamics 4740
Aeroelasticity 4630C, 4630M
Aeronomy 94
Aerosols 4755K, 8270, 92
Aerospace 9480, 9555
Aerospace biophysics 8765
Ageing 8140G
Airglow 9410Q
Algebra 0210

01.30C Conference proceedings

69773 Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids.
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3 (1982). [received: April 1983]
Conference held at: Leningrad, USSR. Date 6-8 April 1981. The following topics were dealt with: optical detection of magnetic resonance, optical alignment and coding of electron-nuclear systems in semiconductors. 36 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant codes in this or other issues.

69774 Proceedings of the Fifth All-Union Conference on Nonresonant Interaction of Optical Radiation with Matter.
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.6 (1982). [received: April 1983]
Conference held at: Leningrad, USSR. Date 1-4 Dec. 1981. The following topics were dealt with: laser generated discharges in condensed media; thermophysical processes in the interaction of laser radiation with absorbing media; absorption waves in gases; gas breakdown; laser damage to materials; metal heating by a laser plasma; a laser study of metal ignition kinetics; elementary surface excitations in insulators and metals; surface oxidation by laser; laser thermochemistry; polarization instability in a light wave in a highly nonlinear medium; laser generation of strong shock waves and the examination of ultrarapid relaxation in a medium by space-time modulation of the perturbing light. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69775 Proceedings of the XVIII All-Union Conference on Emission Electronics.
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.7 (1982). [received: May 1983]
Conference held at: Moscow, USSR. Date Dec. 1981. The following topics were dealt with: adsorption, electroabsorption and thermoadsorption on crystal surfaces; work function and surface electron states; explosive electron emission and electronic structures; cathode sensitivity and photoelectron emission; secondary electron and exoelectron emission. 45 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69776 Annual Meeting of the Seismological Society of America.
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B (Dec. 1982).
Conference held at: Anaheim, CA, USA. Date 19-21 April 1982. The following topics were dealt with: earthquake proof design of buildings, public awareness of seismic hazards, strong ground motion, test ban treaty verification research, the use of computers in network seismology, theoretical seismic wave propagation problems and finally earthquake prediction. 21 papers were presented which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69777 Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC).
J. Geophys. Res. (USA), vol.87, no.C11 (20 Oct. 1982). [received: May 1983]
Conference held at: Hamburg, Germany. Date 24-27 Aug. 1982. The IAMAP Commission on Atmospheric Chemistry and Global Pollution held a symposium on The Role of the Oceans in Atmospheric Chemistry (ROAC), as part of the Third IAMAP Scientific Assembly in Hamburg, West Germany. The papers presented were divided into four sections: (i) the oceans as a source and sink for atmospheric trace gases, (ii) the chemistry of marine aerosols and their production by and deposition to the ocean; (iii) the chemistry of precipitation over the ocean; (iv) theoretical and laboratory modeling of the air/sea exchange of trace gases and aerosols. 30 papers presented at this conference are presented in this and a later issue of this journal.

69778 MICRO 82: High Resolution Electron Microscopy.
J. Microsc. (GB), vol.129, pt.3 (March 1983).
Conference held at: London, England. Date 12-16 July 1982. The following topics were dealt with: high resolution electron microscopy; imaging techniques; moire techniques; application to the study of order-disorder; defect structures, and microstructure; alloy studies. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69779 Symposium on 'The Role of Trace Elements and Interfaces in Creep Failure'.
Metall. Trans. A (USA), vol.14A, no.4 (April 1983).
Conference held at: Dallas, TX, USA. Date 14-18 Feb. 1982. Sponsors: Mech. Metall. Committee of TMS-AIME. The following topics were dealt with: role of grain boundary segregation in diffusional creep; grain boundary sliding, stress concentration and cavity nucleation during creep; effects of trace impurities on ductility; high temperature embrittlement effect of Ce on creep behaviour of superalloys.

69780 Proceedings of the 16th International Conference on the Physics of Semiconductors.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1 (March 1983).
Conference held at: Montpellier, France. Date 6-10 Sept. 1982. Sponsors: IUPAP; Societe Francaise de Physique; European Phys. Soc. The following topics were dealt with: electronic states; shallow and deep impurity states; linear and nonlinear transport and hot electrons; excitons, polaritons and biexcitons; electron-hole liquid and plasma; optical and nonlinear optical properties; narrow gap semiconductor; semimagnetic semiconductors and spin dependent properties; lattice dynamics and electron-phonon coupling; phase transitions; low dimensional materials; intercalation and organic semiconductors; quantum wells, localisation and heterojunctions; superlattices, surfaces and interfaces; amorphous semiconductors and laser beam annealing. 293 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69781 Second Mini-Symposium on Polymer Blends, 'Polyblends '82'.
Polym. Eng. & Sci. (USA), vol.22, no.17 (mid-Dec. 1982).
Conference held at: Montreal, Canada. Date 20 April 1982. Sponsors: Nat. Res. Council Canada. The following topics were dealt with: polymer/polymer blends, their miscibility, properties, development, characterisation, economics and commercialisation; and certain aspects of injection moulding, blow moulding and extrusion. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

69782 ECOSS-5. Proceedings of the Fifth European Conference on Surface Science.
Surf. Sci. (Netherlands), vol.126, no.1-3 (March 1983).
Conference held at: Gent, Belgium. Date 24-27 Aug. 1982. The following topics were dealt with: surface electronic structure; surface vibrations; semiconductor surfaces and interfaces; surface defects; ion-surface interactions; atom scattering at surfaces; alloys and thin films. 139 papers were presented, of which 95 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69783 Proceedings of the 2nd Joint Meeting of the Roland Eotvos Physical Society (Vacuum Physics and Thin Films Sections) and the Austrian Vacuum Society.
Vacuum (GB), vol.33, no.1-2 (Jan.-Feb. 1983).
Conference held at: Brunn am Gebirge, Austria. Date 27-29 Oct. 1981. The following topics were dealt with: thin film growth; mass spectrometers and their applications; thin film resistors; surface structure. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69784 Evolution of the Earth. R.J.O'Connell, W.S.Fyfe [Ed.]
Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Various topics concerning the state of the early Earth and the evolution of the Earth were presented. Individual papers describe the geochemical evolution of the Earth, Earth interior temperature profiles, core and mantle physical structure, radiogenic heat, geomagnetism, plate tectonics, mantle convection, palaeoatmosphere and palaeoocean chemistry and the electrical conductivity of the mantle. 27 papers were presented which are published in full in the present proceedings.

69785 Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received).
East Lansing, MI, USA: Michigan State Univ. (1982), 151 pp.
Conference held at: East Lansing, MI, USA. Date 26 Sept.-1 Oct. 1982. Sponsors: U.S. Dept. Energy.; NSF; IUPAC; et al. The following topics were dealt with: light particle emission; fragmentation and A,Z distributions; nuclear structure and exclusive reactions; energy; momentum and angular momentum transfer; fusion and fission; reaction cross sections; theory. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69786 Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium.
Vienna, Austria: IAEA (1983), 517 pp.
Conference held at: Utrecht, Netherlands. Date 21-25 June 1982. The following topics were dealt with: radioactive waste conditioning; radwaste treatment; waste immobilisation; HLW disposal; radwaste storage; radwaste packaging methods; packaging materials. 35 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69787 Electrostatics 1983. Sixth Conference on Electrostatic Phenomena.
Bristol, England: IOP (1983), x+262 pp. [0 85498 157 8]
Conference held at: Oxford, England. Date 13-15 April 1983. Sponsors: IOP. The following topics were dealt with: electrostatic hazards, fluids, discharges, measurements, solid and industrial electrostatics and electrostatic damage to solid state devices, introducing one of the newer areas of applied electrostatics which reflects the widespread use of electronic devices housed and packaged in plastics. 39 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69788 Melting, Localization, and Chaos. Proceedings of the Ninth Midwest Solid State Theory Symposium.
New York, USA: North-Holland (1982), xxiv+302 pp. [0 444 00695 8]
Conference held at: Argonne, IL, USA. Date 2-3 Nov. 1981. The following topics were dealt with: elementary particle physics; multilayer adsorption; melting; molecular dynamics method; Lennard-Jones systems; structural transformations; antiphase boundaries; correlations; the metal-insulator transition; amorphous semiconductors; localization; the laser; chaos; convecting fluids; KAM surface; intermittency; order; mappings; lattice theory and statistics; renormalization; elastic softening; Kostalitz-Thouless transition; superconductors; Anderson models; random resistor networks; graphite intercalation compounds; electronic structure; piezoelectric switching; liquid structure; spinodal decomposition; nonlinearly coupled oscillators; diffusion; biomembranes; and ϕ^4-theory. 68 papers were presented, of which 16 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69789 Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management.
New York, USA: North-Holland (1982), xxi+768 pp. [0 444 00699 0]
Conference held at: Boston, MA, USA. Date 16-19 Nov. 1981. The following topics were dealt with: radioactive waste forms; chemical properties; physical properties; geological disposal; geochemical considerations for radwaste disposal; canister-backfill interactions; near field interactions; processing complexities; non-HLW assessments; radiation effects on waste forms. 99 papers were presented, of which 92 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69790 Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting.
New York, USA: North-Holland (1982), xi+561 pp. [0 444 00698 2]
Conference held at: Boston, MA, USA. Date Nov. 1981. The following topics were dealt with: fundamentals; processing and characterization; the physical, chemical and mechanical properties of metallic glasses; the physical, chemical and mechanical properties of crystalline alloys; devitrified and microcrystalline alloys; and surface treated alloys. 70 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

69791 Chemistry of the Unpolluted and Polluted Troposphere. Proceedings of the NATO Advanced Study Institute.
Dordrecht, Netherlands: Reidel (1982), x+512 pp. [90 277 1487 8]
Conference held at: Corfu, Greece. Date 28 Sept.-10 Oct. 1981. The following topics were dealt with: measuring techniques, climate and C cycle, trace gases cycles and budgets, troposphere heterogeneous systems and air pollution.

69792 Deposition of Atmospheric Pollutants. Proceedings of a Colloquium.
Dordrecht, Netherlands: Reidel (1982), ix+217 pp. [90 277 1438 X]
Conference held at: Oberursel/Taunus, Germany. Date 9-11 Nov. 1981. The following topics were dealt with: pollutants wet and dry deposition, fog, gaseous matter removal, acid rain; deposition on plants and vegetation is considered.

69793 Atmospheric Turbulence and Air Pollution Modelling.
Dordrecht, Netherlands: Reidel (1982), xxi+358 pp. [90 277 1365 0]
Conference held at: The Hague, Netherlands. Date 21-25 Sept. 1981. The following topics were dealt with: similarity relations, scaling laws, boundary layer modelling, convective boundary layer diffusion and air pollution modelling.

69794 Sea Level Ice and Climatic Change. Proceedings of a Symposium.
Washington, DC, USA: Int. Assoc. Hydrological Sci. (1981), xv+471 pp.
Conference held at: Canberra, Australia. Date Dec. 1979. Sponsors: Int. Assoc. Hydrological Sci.; et al. The following topics were dealt with: sea level, ice, climate, snow, glaciers, Nepal, heat balance, river icing, Antarctic, Mt. Kenya, Weddell Sea, general circulation model, microparticle concentrations, Greenland, temperature, palaeogeodesy, Quaternary, eustacy, China, Holocene and orbital radiation variation.

69795 First International Conference on Optical Fibre Sensors.
London, England: IEE (1983), viii+216 pp.
Conference held at: London, England. Date 26-28 April 1983. The following topics were dealt with: temperature sensors; interferometric sensors; sensor applications; couplers and components; optical fibres; liquid level sensors and refractometers; displacement sensors; optical fibre gyroscopes and resonators; polarisation sensors; frequency modulation techniques and fluorescence sensors. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

01.30E Monographs, and collections

69796 Tectonic and geologic evolution of southeast asian seas and islands. Pt.2. D.E.Hayes.
Washington, DC, USA: American Geophysical Union (1983), 402 pp. [0 87590 053 4]
Discusses seismotectonics, Phillipine Islands, tectonics, subduction, palaeomagnetism, emplacement, geology, geochemistry, Marianas arc-trench-back arc complex, seismicity, crustal spreading, volcanism, Phillipine Sea, Molucca Sea and geochronology.

69797 Current topics in materials science. Vol.10. E.Kaldis [Ed.]
Amsterdam, Netherlands: North-Holland (1982), vi+515 pp. [0 444 86321 4]
This volume contains 5 reviews entitled as follows: Diataxy (graphoepitaxy) and other approaches to oriented crystallisation on amorphous substrates; SbSI and other ferroelectric $A^{V}B^{VI}C^{VII}$ materials; Nonstoichiometry of inorganic solids; spectroscopy, structure and bonding of high-temperature metal halide vapour complexes; and Gem materials, natural and artificial.

01.30K Handbooks, dictionaries, tables and data compilation

69798 A compilation of resonance integrals from hydrogen to fermium. E.M.Gryntakis, J.I.Kim (Inst. fur Radiochem., Tech. Univ. Munchen, Garching, Germany).
J. Radioanal. Chem. (Switzerland), vol.76, no.2, p.341-496 (1983).
The compilation comprises the experimental and calculated resonance integrals of nuclides (hydrogen to fermium), for neutron capture and fission reactions. The thermal cross-sections of the corresponding reactions are also included. Whenever possible, in addition to original values of the resonance integrals, normalized values are also given. The theoretical explanation and physical meaning of the resonance integrals determined by different approaches are briefly discussed. (439 refs.)

69799 Bound coherent and incoherent thermal neutron scattering cross sections of the elements. V.F.Sears.
Report AECL-7980, Atomic Energy Canada Ltd., Chalk River, Ont. (Dec. 1982), 24 pp.
An up-to-date table of bound coherent and incoherent thermal neutron scattering cross sections of the elements is presented. Values from two different data sources are calculated and compared. These sources are: (1) the free-atom cross sections listed in the 'barn book' and (2) the Julich scattering length tables. The authors also call attention to, and clarify, the confusion that exists in the literature concerning the sign of the imaginary part of the complex scattering length. (30 refs.)

01.30M Textbooks for graduates and researchers

69800 Fusion. Vol.1. Magnetic confinement. Part A. E.Teller [Ed.]
London, England: Academic Press (1981), xiii+491 pp. [0 12 685201 4]
Presents 7 chapters covering every approach to magnetic confinement fusion. The individual chapers of this graduate students' book are: Tokamak plasma stability; Tokamaks; stellarators; mirror theory; mirror confinement physics; and the reversed field pinch.

69801 Introduction to atomic and molecular collisions. R.E.Johnson.
New York, USA: Plenum (1982), xiii+288 pp. [0 306 40787 6]
The book is written at graduate level and comprises six chapters. In the first chapter, a rationale and a perspective are given for understanding the collisions of atoms and molecules. A number of collision-related macroscopic phenomena are discussed qualitatively with the role of atomic and molecular interactions delineated. In the second chapter, the notion of a cross section is developed and then related to collision quantities discussed. This is followed by a classical treatment of collisions. Background material on wave mechanics and atomic and molecular notation are given in Chapter 3 in order that students who have had only basic instruction in this area can easily follow the discussion of the wave mechanical description of collisions. The description of molecular interactions is completed in Chapter 4, where interaction potentials and transition probabilities are calculated. In Chapter 5, a summary of experimental results for cross sections and rate constants is presented and related to the cross-section models and potentials discussed earlier. This is followed, in Chapter 6, by a return to the material presented in Chapter 1.

69802 Vibrational intensities in infrared and Raman spectroscopy. W.B.Person, G.Zerbi [Ed.]
Amsterdam, Netherlands: Elsevier (1982), xvi+466 pp. [0 444 42115 7]
The following topics were dealt with: Techniques of measuring infrared and Raman intensities are described. The major part of the book deals with interpretation of these intensities. The electro-optical parameter theory and some of the results from quantum mechanical calculations are presented. Potential applications of vibrational intensities to a wide range of topics is also described.

69803 Formulas, facts and constants. For students and professionals in engineering, chemistry and physics. H.J.Fischbeck, K.H.Fischbeck.
Berlin, Germany: Springer-Verlag (1982), xii+251 pp. [3 540 11315 0]
The book provides a handy source of formulas, conversion factors and constants for everyday use. The formulas and tables are amended by examples in all of those cases where their use is not self-explanatory. Section 1 provides the fundamental tools of mathematics needed in all areas of the physical sciences. Section 2 summarizes the SI system, lists conversion factors and provides precise values of fundamental constants. Sections 3 and 4 review the basic terms of spectroscopy, atomic structure and wave mechanics. These sections serve as a guide to the interpretation of modern literature. Section 5 is a resource for work in the laboratory. Data and formulas are given to be of assistance in the use of frequently encountered equipment such as vacuum systems and electronic devices. Material constants and other data are listed for information and as an aid for estimates or problem solving.

69804 Heavy ion collisions. Vol.3. R.Bock [Ed.]
Amsterdam, Netherlands: North-Holland (1982), x+666 pp. [0 444 85352 9]
Written for graduate students entering the field and research specialists, this volume contains four chapters covering; in-beam gamma-ray spectroscopy; hyperfine interactions in isolated ions; on-line mass spectroscopy; and some current aspects of atomic collisions between heavy ions.

69805 Masers and lasers. An historical approach. M.Bertolotti.
Bristol, England: Adam Hilger (1983), xii+268 pp. [0 85274 536 2]
Masers and lasers are relatively recent inventions which have rapidly found varied applications in many areas of science and industry. Professor Bertolotti's book describes the invention and development of both kinds of device, following their progress historically from 1916, when Einstein first proposed the concept of stimulated emission, until the present day. The fundamental theory of masers and lasers is given in order to complement this historical treatment. By means of extracts from the writings and recollections of scientists closely involved with masers and lasers, the author throws light on the way they were led to their inventions, and gives an idea of how they made use of one another's ideas and contributions. This book will appeal to anyone actively working with masers or lasers, or to physical scientists with an interest in scientific history. It will also be useful for anyone requiring an introduction to the fundamental physical theory involved, and extensive references to more specialised literature are included for those wishing to delve further into the subject.

69806 Physics of the Jovian magnetosphere. A.J.Dressler [Ed.]
Cambridge, England: Cambridge (1983), xv+544 pp. [0 521 24558 3]
Discusses the magnetic field and magnetosphere of Jupiter, the ionosphere, plasma characteristics, the low energy particle population, high-energy particles, the Io torus, radioemission from Jupiter, plasma waves and models of the magnetosphere.

69807 Laser processing and analysis of materials. W.W.Duley.
New York, USA: Plenum (1983), xiii+463 pp. [0 306 41067 2]
The rapid development of laser technology over the past dozen years has led to the availability of reliable, industrially rated laser sources with a wide variety of output characteristics. This, in turn, has resulted in new applications as the laser becomes a familiar processing and analytical tool. This text surveys recent developments made in the field of materials processing and analysis by means of lasers. Examples are drawn from chemical, metallurgical, and semiconductor processing, while the use of lasers as analytical tools in the laboratory and in industry is thoroughly examined. An introductory chapter provides a comprehensive overview of lasers and laser systems and their uses. Scientists, engineers, researchers, and students involved with laser applications will find this volume a valuable source of current information. (889 refs.)

01.30P Textbooks for undergraduates

69808 Similarities in physics. J.N.Shive, R.L.Weber.
Bristol, England: Adam Hilger (1982), xv+277 pp. [0 85274 540 0]
The purpose of the authors' book is to tie similar phenomena together, wherever they may appear, in mechanics, acoustics, optics, electricity, heat, or theoretical physics and to call one's attention to the similarities among them. The book may be so used by teachers who wish to present second-level physics from the analogy point of view. The authors' primary purpose has been to develop insight. Some presentation of new knowledge is undertaken, to be sure, but chiefly to broaden the insight. The book may therefore find its greatest usefulness as collateral reading material. It should be helpful, too, to students at all levels studying for comprehensive examinations.

69809 **Evolution of the Universe.** I.D.Novikov.
Cambridge, England: Cambridge (1983), xiv+176 pp. [0 521 24129 4]
Discusses the expanding Universe, relativistic cosmology, the hot Universe, formation and structure of the Universe and new and foreseen developments.

01.30T Bibliographies

69810 **Spectroscopy of molecular crystals. A bibliography for 1980.** E.F.Sheka, V.S.Makarova, T.A.Krivenko (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR).
Mol. Cryst. & Liq. Cryst. (GB), vol.91, no.3-4, p.197-276 (1983).
The bibliography is split into sections containing references on: books and reports of meetings; spectra of aromatic molecules in gaseous and condensed states; absorption and luminescence spectra of intermolecular complexes; spectra of pure molecular crystals; spectra of impurity and disordered molecular crystals; the exciton problem of molecular crystals; photoconductivity of molecular crystals including photoelectronic emission; effects of high exciton concentration in nonmetallic crystals; molecular crystal structure, thermodynamic data; and neutron spectroscopy of crystals. There is an author index. (1107 refs.)

69811 **Theory of partial coherence. A bibliography for the period 1976-1980.** K.Sing (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
Opt. Appl. (Poland), vol.12, no.3-4, p.489-98 (1982).
Most of the research detailed deals with the subjects of radiometry and partial coherence, directionality and spatial coherence and the influence of source structure in far-zone measurements. A particular emphasis was made on investigations dealing with the relationship between the spectral spatial coherence in the source plane and in the far-zone in terms of the generalized van Cittert-Zernike theorem and its inverse. (216 refs.)

01.40 EDUCATION

69812 **Teaching physics education in Iraq.** F.Esmael (Egyptian Antiquities Organization, Cairo, Egypt).
Phys. Teach. (USA), vol.21, no.4, p.224-9 (April 1983).
The author describes his experience teaching physics education at the College of Education at Mosul University in Iraq. He outlines the backgrounds of the students and describes the entry requirements and patterns of recruitment. He discusses the attitudes of the students, whose low opinion of the teaching profession and prediction for 'teaching by prompting', a style which involves little scope for learning by experiment, deduction or exploration. He concludes with a statement of his hopes and ideals for the teaching of physics education. (8 refs.)

01.50 EDUCATIONAL AIDS

69813 **Physicist's version of traveling salesman problem: statistical analysis.** R.S.Armour,Jr., J.A.Wheeler (Center for Theoretical Phys., Univ. of Texas, Austin, TX, USA).
Am. J. Phys. (USA), vol.51, no.5, p.405-6 (May 1983).
The authors report a statistical calculation of the average distance covered by the traveling salesman, per customer visited, in its dependence upon the width of the 'swaths' of landscape covered. They find a 'practical person's minimum' of (0.921) (density of points)$^{-1/2}$ for a swath width of (1.732) (density of points)$^{-1/2}$. The point of greatest physical interest is the foliation induced in the random pattern of cities to be visited by the 'regulating principle' of minimum distance. (4 refs.)

69814 **Potential difference and current in simple electric circuits: a study of students' concepts.** R.Cohen, B.Eylon, U.Ganiel (Dept. of Sci. Teaching, Weizmann Inst. of Sci., Rehovot, Israel).
Am. J. Phys. (USA), vol.51, no.5, p.407-12 (May 1983).
A study which was designed to identify students' concepts of simple electric circuits is reported. A diagnostic questionnaire was administered to a sample of 145 high school students and 21 physics teachers. The questionnaire included mainly qualitative questions which were designed to examine students' understanding of the functional relationships between the variables in an electric circuit. The main findings obtained from the analysis of the responses are current is the primary concept used by students, whereas potential difference is regarded as a consequence of current flow, and not as its cause. Consequently students often use $V=IR$ incorrectly. A battery is regarded as a source of constant current. The concepts of EMF and internal resistance are not well understood. Students have difficulties in analyzing the effect which a change in one component has on the rest of the circuit. This is probably due to the more general difficulty students have in dealing with a simultaneous change of several variables. (15 refs.)

69815 **Quantum logic.** C.G.Adler, J.F.Wirth (Dept. of Phys., East Carolina Univ., Greenville, NC, USA).
Am. J. Phys. (USA), vol.51, no.5, p.412-17 (May 1983).
A discussion of quantum logic is presented. An example, drawn from elementary quantum mechanics, is used to illustrate the failure of the classical distributive law which is quantum logic's most singular feature. Furthermore, an elaboration and explanation of an existing analog suitable for classroom demonstration is also presented. Finally, some remarks are made on the possible impact of quantum logic. (25 refs.)

69816 Elementary particle resonances from a semiclassical perspective. R.A.Arndt, L.D.Roper (Dept. of Phys., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Am. J. Phys. (USA), vol.51, no.5, p.418-20 (May 1983).
The motion of a particle in a short-range attractive potential, when treated classically but with quantized angular momentum l, can give rise to a finite series of particle 'resonances'. When this picture is applied to the π-NP_{33} resonance it is discovered that a physically reasonable Yukawa potential could produce the effect and that no resonances of higher l value would exist. (7 refs.)

69817 Rutherford scattering in two dimensions. G.Barton (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).
Am. J. Phys. (USA), vol.51, no.5, p.420-2 (May 1983).
Parabolic coordinates allow Schrodinger's equation to be solved analytically for a particle confined to the xy plane and incident with velocity v on a potential C/r. In sharp contrast to the three-dimensional case, the cross section assumes its classical value only in the rationally foreseeable classical regime $|C|/\hbar v \gg 1$, but not otherwise; and in this low-velocity regime the enhancement factor (probability density at the origin) for an attractive potential tends to 2 (independently of the value of $|C|$), instead of diverging as in three dimensions like some inverse power of v. (8 refs.)

69818 Bikework. R.C.Nicklin (Dept. of Phys. & Astron., Appalachian State Univ., Boone, NC, USA).
Am. J. Phys. (USA), vol.51, no.5, p.423-9 (May 1983).
An exercise bicycle was fitted with a microswitch. The switch allows a small computer to time each revolution of the pedal crank. Constant work is done for each turn and so work versus time and instantaneous power versus time are readily calculated. A simple theory for the work as a function of time turns out to be sufficient. A comprehensive program, BIKEWORK, was written to enable a PET 4016 computer to be used for data gathering and analysis. In addition, a strategy for using computers in the laboratory emerged. The student benefits by having the computer do all the calculations necessary to critique each student's work. The results are available before the student leaves the lab. (8 refs.)

69819 A tidal force pendulum. O.Gron (Inst. of Phys., Univ. of Oslo, Blindern, Oslo, Norway).
Am. J. Phys. (USA), vol.51, no.5, p.429-31 (May 1983).
A tidal force pendulum is presented. Its period is calculated in three different ways: (a) by means of the spin equation, (b) using the Lagrangian formalism, and (c) by means of the equation for geodesic deviation. The period of the pendulum is independent of its length. It depends only upon the curvature of space-time at the position of the pendulum. (5 refs.)

69820 *F*-centers: advanced laboratory experiments as a 'research project'. J.F.Reichert (Dept. of Phys., State Univ. of New York at Buffalo, Amherst, NY, USA).
Am. J. Phys. (USA), vol.51, no.5, p.431-3 (May 1983).
A sophomore physics laboratory project is described which experimentally and theoretically studies by optical absorption bands of *F*-centers in alkali halide crystals using a variety of instrumental techniques. The student is challenged to develop a theoretical model to describe the optical absorption data. (5 refs.)

69821 The computer in lab—A/D and D/A conversion. R.C.Nicklin, B.Rafert (Dept. of Phys. & Astron., Appalachian State Univ., Boone, NC, USA).
Am. J. Phys. (USA), vol.51, no.5, p.434-9 (May 1983).
This article gives a brief introduction to analog-to-digital and digital-to-analog conversion. Circuit deails and programs are presented for using the AD7574 and AD558 converters with the KIM-1 computer. The resulting interface is easy to build, easy to use, and inexpensive. One application, which converts any triggered scope into a storage scope, is to capture and digitize a waveform and then display the waveform on an oscilloscope. (23 refs.)

69822 Numerical solutions of Van der Pol's equation. W.F.Drish,Jr. (Assoc. of American Railroads, Chicago, IL, USA), W.J.Wild.
Am. J. Phys. (USA), vol.51, no.5, p.439-45 (May 1983).
A qualitative picture of the solution to Van der Pol's equation, using rough phase plane plots, is obtained prior to using the Taylor and Modified Euler (TAME) method to obtain more exact phase plane plots. The character of the solution, which is a relaxation oscillation, is discussed. Finally, an application of Van der Pol's equation to a DC motor-generator hookup is given. (10 refs.)

69823 Report on using TIPS (teaching information processing system) in teaching physics and astronomy. N.O.Folland (Kansas State Univ., Manhattan, KS, USA), R.R.Marchini, C.R.Rhyner, M.Zeilik.
Am. J. Phys. (USA), vol.51, no.5, p.446-9 (May 1983).
A computer-managed instruction system, TIPS, has been used for over a decade in the teaching of diverse disciplines. This paper describes the recent use of TIPS in physics and astronomy courses at Kansas State University, Memphis State University, University of New Mexico, and University of Wisconsin-Green Bay. Student reactions to TIPS were largely positive, but the degree of success in improving student performance reported in many articles has not been observed. (7 refs.)

69824 Spinning objects on horizontal planes. L.A.Whitehead, F.L.Curzon (Dept. of Phys., Univ. of British Columbia, Vancouver, Canada).
Am. J. Phys. (USA), vol.51, no.5, p.449-52 (May 1983).
The authors present a simple theoretical analysis, of a common form of motion of a rotationally symmetric object (or symmetric top). The object, with its center of mass stationary, spins about its symmetry axis and rolls without slipping on a horizontal surface. The motion, which is referred to in the paper as 'wobbling', is long-lasting and stable and is exhibited by common objects (coins, bottles, plates, etc.) when they are spun on horizontal, flat surfaces. An apparatus is described for maintaining the 'wobbling' motion of a metal cylinder, which can be observed in slow motion by means of stroboscopic illumination. (1 ref.)

69825 The Si photodiode: an inexpensive though high-performing α detector. J.-C.Dousse, C.Rheme (Phys. Dept., Univ. of Fribourg, Fribourg, Switzerland).
Am. J. Phys. (USA), vol.51, no.5, p.452-5 (May 1983).
A common photodiode can be used as a good performing α detector. The energy response is quite linear. A good resolution and efficiency can be obtained. The main advantage, however, is the very low price. The useful area is limited to a few mm^2. A charge sensitive preamplifier has been especially designed. (4 refs.)

69826 Note on 'Spin-weighted spherical harmonics and electromagnetic multipole expansions'. R.B.S.Brooks, A.Purkis (Dept. of Maths., Bates Coll., Lewiston, ME, USA), M.D.Semon.
Am. J. Phys. (USA), vol.51, no.5, p.456-7 (May 1983).
In a recent article Joseph Scanio (see ibid., vol.45, p.173, 1977) gave a pedagogical introduction to multipole expansions of the electromagnetic field in terms of spin-weighted spherical harmonics. The spin-weighted spherical harmonics are a complete orthonormal set for functions of the spherical variables θ and ϕ. As Scanio demonstrates, expanding the radial, positive and negative helicity components of $(\mathbf{E}+i\mathbf{B})$ in their own terms results in a surprisingly simple and elegant formalism for electromagnetic scattering problems. While studying this material the authors found that certain questions arose which are answered in the literature, and which show the method to be more far-reaching and successful than they expected. The authors supplement Scanio's article by summarizing the questions they had, the answers they found and some references for further study. (12 refs.)

69827 The relation between the heat current and the phonon drift velocity. S.Simons (Dept. of Appl. Maths., Queen Mary Coll., London, England).
Am. J. Phys. (USA), vol.51, no.5, p.457-8 (May 1983).
In a perfect nonconducting crystal at low temperatures, the heat is transported by phonons whose only interactions are N processes which conserve the phonon wave number, $\mathbf{k}$. This gives rise to a stationary phonon distribution of the form $n(\mathbf{k})=\{\exp[(\hbar/\kappa T)(\omega-\mathbf{u}.\mathbf{k})]-1\}^{-1}$ (where ω is the phonon frequency), characterized by a drift velocity $\mathbf{u}$. It is known that if $u \ll v$, the phonon velocity, then for an isotropic medium the heat current $\mathbf{J}$ is parallel to $\mathbf{u}$. The author shows that this remains true for an anisotropic medium, the precise relationship being given by $\mathbf{J}=TS\mathbf{u}$, where T and S are, respectively, the temperature and entropy of the phonon assembly. (2 refs.)

69828 Maximizing the range of the shot put without calculus. S.K.Bose (Dept. of Phys., Simon Fraser Univ., Burnaby, Canada).
Am. J. Phys. (USA), vol.51, no.5, p.458-9 (May 1983).
Some time back, Lichtenberg and Wills (see ibid., vol.46, p.547, 1978) discussed the problem of finding the optimum angle at which a putter should release the shot in order to achieve maximum distance. Assuming that the shot is launched with velocity v_i from a height h over level ground in a uniform gravitational field, they express the range R as a function of the angle θ which the initial velocity vector makes with the horizontal and set $dR/d\theta$ equal to zero. Palffy-Muhoray and Balzarini (1982) pointed out that the problem could be solved without the use of calculus. Their method is short and elegant, but utilizes the idea of dot and cross products of vectors. Often the problem of projectile motion is encountered by students in a very introductory level physics course before they have had any exposure either to calculus or to the idea of products of vectors. The present author shows that this problem can be solved even with the use of a simple high school level of algebra, which most students taking an introductory physics course at an university are supposed to be familiar with. (2 refs.)

69829 A probabilistic derivation of the stability condition of the difference equation for the diffusion equation. B.Kaplan (Air Force Inst. of Technol., Wright-Patterson Air Force Base, OH, USA).
Am. J. Phys. (USA), vol.51, no.5, p.459-60 (May 1983).
A previous paper (see Gibbs et al. (1975)) demonstrated the solution to Laplace's and Poisson's equations by the random walk method. The probabilistic interpretation of difference equations can also be used to solve the diffusion equation by the Monte-Carlo method. The author shows that the probabilistic interpretation of the explicit finite difference equation for the diffusion equation can also be employed for pedagogical reasons to give a heuristic derivation of the stability criteria of the former. (7 refs.)

69830 Retarded square-well potential. J.Kapusta (Theory Div., CERN, Geneva, Switzerland).
Am. J. Phys. (USA), vol.51, no.5, p.460-1 (May 1983).
In an effort to gain some insight into the workings of interactions which are nonlocal in time, Blanchard (1981) noted that a mildly retarded oscillator potential behaves like an instantaneous logarithmic potential at large distances. The present author points out that particle motion in a retarded square-well potential is exactly soluble, and displays quite clearly the features one expects from interactions which are nonlocal in time. (2 refs.)

69831 An elementary development of mass-energy equivalence. D.J.Steck (Dept. of Phys., Saint John's Univ., Collegeville, MN, USA), F.Rioux.
Am. J. Phys. (USA), vol.51, no.5, p.461-2 (May 1983).
The authors describe a simple derivation of the mass-energy equivalence equation which they have not seen previously in the literature. The derivation is of the type which Einstein used and employs a 'thought experiment' in which an elementary photon emission event is examined by two sets of inertial observers. A comparison of the analyses of these observers brings the validity of the principle of momentum conservation into question. However since the conservation of momentum is the cornerstone of dynamics it is preserved at all costs. This is accomplished by allowing the concepts of the mass and energy to undergo redefinition. (2 refs.)

69832 Comment on 'The concept of temperature and its dependence on the laws of thermodynamics'. J.S.Thomsen (Dept. of Phys., Johns Hopkins Univ., Baltimore, MD, USA).
Am. J. Phys. (USA), vol.51, no.5, p.462 (May 1983).
Ehrlich (1981) has recently given an extended analysis of the concept of temperature, based on the laws of thermodynamics. In that paper he stressed the concept of temperature. The present author in 1962 published a restatement of the zeroth law of thermodynamics, namely there exists a scalar quantity called temperature, which is a property of all thermodynamic systems (in equilibrium states), such that temperature equality is a necessary and sufficient condition for thermal equilibrium. The terms 'scalar quantity' and 'necessary and sufficient' appear to establish a temperature order and overcome some of the gaps which Ehrlich finds in other treatments. Of course, the formulation achieves this by postulating something beyond the conventional form of the zeroth law, which then follows as a corollary. The above form also explicitly includes the requirement for equilibrium states. In Ehrlich's approach his domain D_1 is presumably restricted to systems which are either in equilibrium states or very close to equilibrium. There is one minor problem in Ehrlich's interesting parameter, i.e. the definition of heat reservoir. (2 refs.)

69833 Further support for a 'physical' interpretation of the primes. E.Staring, M.Staring (Dept. of Math., Inst. for Teachers Education, Sittard, Netherlands).
Am. J. Phys. (USA), vol.51, no.5, p.462-3 (May 1983).
In March 1982, H. Gutfreund and W.A. Little published a 'physicist's proof of Fermat's theorem of primes'. In their note they suggest an analogy between the primes and lack of symmetry of certain Ising-spin systems. This physical interpretation of primes can be further supported by a proof of Wilson's theorem on primes: if p is a prime, then $(p-1)!=-1$ (mod p). This proof will be presented here. (1 ref.)

69834 The rocket problem revisited. S.K.Bose (Dept. of Phys., Simon Fraser Univ., Burnaby, BC, Canada).
Am. J. Phys. (USA), vol.51, no.5, p.463-4 (May 1983).
The motion of a rocket in a force-free space is discussed in many introductory physics textbooks. It is shown that the final velocity achieved by the rocket is independent of how the fuel is released. The magnitude of the final velocity is

given by $V_f=u \ln (M_i/M_f)$, (1) where M_i and M_f are the initial and the final masses of the system, respectively, and μ is the velocity of escape of the fuel (measured in the frame of the rocket), opposite to the direction of the rocket motion. According to Eq. (1), the fuel can be expended slowly or rapidly without altering the final velocity. It is the author's experience that quite often students tend to generalize this result to the motion of any system with diminishing mass and moving in absence of external forces. In this regard, the author would point out that the independence of the final velocity from 'the way the mass is lost' is a consequence of the continuity of mass flow. It is this continuity that enables one to calculate the momentum change of the rocket for an infinitesimal time interval Δt and take the limit $\Delta t \to 0$, thus arriving at Eq. (1). In cases where such a limit does not exist, the final velocity does depend on how the mass is lost. (4 refs.)

69835 Polarized double-slit diffraction. W.C.Henneberger, R.N.Zitter (Dept. of Phys. & Astron., Southern Illinois Univ., Carbondale, IL, USA).
Am. J. Phys. (USA), vol.51, no.5, p.464-5 (May 1983).
A thought experiment in which one places a suitable detector behind a Young's double slit in an attempt to determine through which slit a photon has passed is discussed in many textbooks on modern physics and optics. The idea originated with Einstein, and Bohr argued that determination of the slit through which the photon has passed destroys the double-slit diffraction pattern, giving instead a superposition of single-slit patterns. The authors report a simple and alternative method of determining through which slit a photon has passed. They simply label the photons by their polarizations, e.g. by placing perpendicularly oriented Polaroid sheets behind the slits. Then once a photon has gone through either slit, its polarization indicates which slit it has gone through. (4 refs.)

69836 Comment on 'A simple model of the arms race' [and reply]. D.Schroeer (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA), L.I.Zane.
Am. J. Phys. (USA), vol.51, no.5, p.465-7 (May 1983).
In his recent article L.I. Zane (1982) presented a simple calculational model of the arms race. It is a mathematical description of the strategic nuclear relationship between two nuclear powers. Zane's model is readily understandable, but risks oversimplification. The present author briefly reviews the literature on this type of model, and points out how more complex versions may avoid some serious potential misunderstandings. Zane replies to this comment by thanking Schroeer for bringing other references of the arms model to his attention, but points out that simple models don't necessarily model reality better when they are made more complex though they certainly encourage one to think more seriously about the problem being modeled. (11 refs.)

69837 Comment on 'Photons and Doppler shifts in Einstein's derivation of mass energy'. R.H.Klein (Dept. of Phys., Cleveland State Univ., Cleveland, OH, USA).
Am. J. Phys. (USA), vol.51, no.5, p.467 (May 1983).
It has been noted, in a recent article by Jordan (1982), that Einstein's original argument for showing the equivalence of mass and energy is particularly accessible to students in a liberal arts science course intended for nonscience majors. The present author notes that an even simpler argument, requiring knowledge only of the nonrelativistic Doppler shift, can be found in a later paper by Einstein (1905). (3 refs.)

69838 Laser interference experiment using punchcard slits. M.J.Moloney (Div. of Phys., Rose-Hulman Inst. of Technol., Terre Haute, IN, USA).
Am. J. Phys. (USA), vol.51, no.5, p.468 (May 1983).
Describes a successful interference experiment that the author has run for a number of years using homemade slits from computer punchcards. A very recent modification of the experiment eliminates a comparator for determining slit widths and improves the precision in this experiment. (no refs.)

69839 Measurement of refractive index in transparent plates with a piece of paper and a laser source. S.Reich (Dept. of Plastics Res., Weizmann Inst. of Sci., Rehovot, Israel).
Am. J. Phys. (USA), vol.51, no.5, p.469 (May 1983).
A simple method for the measurement of the refractive index in transparent plates is demonstrated. A piece of filter paper or blotter is wetted with water and applied onto a glass plate. Laser beam is impinged perpendicularly to the plate and a bright ring is observed on the paper. Knowing the thickness of the plate d and the inner radius of the ring R, the refractive index of the plate is calculated. The geometrical optics of the system are shown. The wet paper serves both as a scatterer for the impinging laser light and as a scattering screen for the ring projection. All rays that enter the plate travel through until the condition for total internal reflection inside the plate is fulfilled. At this critical angle θ_c, and for larger angles the light is reflected and forms the ring pattern. (no refs.)

69840 Products of two vectors. Y.S.Jain (Dept. of Phys., North Eastern Hill Univ., Shillong, India).
Am. J. Phys. (USA), vol.51, no.5, p.470-1 (May 1983).
The dot and the cross products of a and b are defined, respectively, as $\mathrm{a.b}=ab \cos \theta$ (1), $\mathrm{a}\times\mathrm{b}=\hat{n}ab \sin \theta$ (2). Here all notations have their usual meanings. Authors of various texts on vector algebra differ on the basis for adopting these definitions. Resnick and Halliday (1976) believe that these operations are defined in this way because they prove useful in physics, otherwise one can have an alternative such as $\mathrm{a.b}=a^{1/3}b^{1/3} \tan \theta/2$ (3). Similar views are held by Arfken (1970). However, others do not state any reason explicitly; perhaps they agree with the argument (often given in the classroom) that Eqs. (1) and (2) simply define the two products and do not require any basis for this purpose. This note establishes that Eq. (1) and (2) are unique and could be formulated mathematically. For this purpose it examines the net product, a*b, defined as a quantity obtained through the normal process of algebraic multiplication of expressions defining the vectors. (5 refs.)

69841 Two-inductor electrostatic generator. A.Aresti (Gruppo Nazionale Struttura della Materia, Univ. di Cagliari, Italy), A.Delunas.
Am. J. Phys. (USA), vol.51, no.5, p.472-3 (May 1983).
A large number of induction electrostatic generators have been designed and built by many people in the last century. Amongst these, Wimshurst's machine is the best known because of its widespread use in educational institutions all over the world. However, the presence of two counter-rotating disks makes it difficult to explain it to students. On the other hand, the authors believe that the Kelvin water drop generator offers a model of induction charging which is simpler to explain. However, the Kelvin device does have an inconvenient problem, namely that if the potential difference builds up too much, before the electrical breakdown between the cans, as the electrical force approaches the size of the gravitational force, the drops are deflected which ends up wetting the apparatus. The generator then has to be dried with care before resuming operations. In order to eliminate the use of water and at the same time retain the advantages of the simpler model to explain to students, the authors have built a simple disk electrostatic generator. Even though this apparatus has much in common with several ancient machines and it is not as efficient as the Wimshurst's machine, it is a very useful device to use for teaching because of its simplicity. (no refs.)

69842 Simple demonstration of momentum change. D.H.Martin (Dept. of Phys., North Carolina State Univ., Raleigh, NC, USA).
Am. J. Phys. (USA), vol.51, no.5, p.474 (May 1983).
A perhaps not uncommon act of instructors when lecturing on momentum and impulse is to throw an eraser, a ball, or other handy small object against a wall or blackboard, and to discuss implications of the collision. As the wall is relatively very massive, a measurement of mass and an estimate of object velocities before and after collision allow the instructor to estimate the impulse. However, obtaining a good estimate of time of impact and average force of impact is more difficult. A 'quick-and-not-too-dirty' minimum set-up method of measuring the average force during impact is as follows: If a sponge rubber ball is used and is thrown against a solid (chalk-covered) blackboard, it will remove some chalk and leave a circular imprint, giving a measure of how much the ball compressed, or indented, during impact. Then by pressing the ball against a scale pan so as to produce the same impression, the variation of force with compression and the maximum force of interaction can be obtained. (no refs.)

69843 Chladni figures on a tympani head. V.J.Ostdiek, T.D.Brady (Phys. Dept., Benedictine Co., Atchison, KS, USA).
Am. J. Phys. (USA), vol.51, no.5, p.474 (May 1983).
In connection with a study of the acoustical behavior of tympani the authors produced Chladni patterns for several of the important tone producing modes of the head. The head was leveled and then sprinkled with red sand. An 8-in. speaker, driven by a 20-W amplifier, was suspended about 20 cm above the head and positioned over an antinode of a particular mode. The frequency of the sine wave input to the amplifier was slowly varied until a pattern appeared. Extreme care in tuning was required as the slightest asymmetry in tension in the head distorts or eliminates the figures. Chladni figures for the modes were produced on an old Ludwig 25-in. tympani (with plastic head) tuned to E_3 (165 Hz). (3 refs.)

69844 Laser beam deflection by thermal gradient. G.Spagna (Dept. of Phys., Rensselaer Polytech. Inst., Troy, NY, USA).
Am. J. Phys. (USA), vol.51, no.5, p.475 (May 1983).
The bending of light rays as they pass through regions of varying index of refraction is well known, and leads to such familiar phenomena as mirages, looming, and the shimmer around hot objects. Several demonstrations, invoking either thermal or chemical density gradients are readily available in the literature. The author presents one more, which takes advantage of the intense, collimated beam of an He-Ne laser to emphasize the deflection. The demonstration is compact, easy to set up, and requires no video system to be seen by large groups. (2 refs.)

69845 Toys in physics teaching: Cartesian diver. R.C.Turner (Dept. of Phys. & Astron., Clemson Univ., Clemson, SC, USA).
Am. J. Phys. (USA), vol.51, no.5, p.475-6 (May 1983).
The Cartesian diver has long been used as a scientist's 'toy' to demonstrate properties of fluids. Deschanel in his 1884 text on Natural Philosophy refers to the Cartesian diver as having been 'described in old treatises on physics'. Carhart and Chute refer to it as a 'hydrostatic toy' used to illustrate the Archimedes principle by Descartes (1596-1650). In spite of the longevity of use of the Cartesian diver, the scientific literature continues to contain discussions of modifications and sophistications of this relatively simple device, as well as rediscoveries of earlier ideas for its use. (15 refs.)

69846 Siting, constructing, and maintaining a deep underground science laboratory. R.R.Sharp,Jr. (Los Alamos Nat. Lab., Los Alamos, NM, USA).
AIP Conf. Proc. (USA), no.96, p.278-84 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
Experience from a recent site selection study has shown that the important considerations in siting a deep underground science facility are numerous, complicated, and most often based in economics. Even so, there are natural constraints on the maximum depth, size of openings, and construction techniques that can be attained or utilized at any particular site. In general, these are set by the local geothermal gradient, hydrologic regime, and properties of the rock mass or substance that are pertinent to geological, mining, and drilling engineering. At the same time, economics control the type of access, means of dewatering, and methods of sustaining the openings that are most feasible. If major faults can be avoided, sites offering acceptable temperature, a low water table, no outstanding aquifers or badly broken ground above the main openings, and strong, massive, largely impermeable rocks surrounding them at depth are best. Upon completion of a facility, the investment and safety of the occupants demand its rigorous maintenance. (25 refs.)

01.65 HISTORY OF SCIENCE

69848 Heat transfer in the last decade. R.H.Sabersky (Div. of Engng. & Appl. Sci., California Inst. of Technol., Pasadena, CA, USA).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.2, p.85-100 (March-April 1983).
In September of 1982, as part of the 7th International Heat Transfer Conference in Munich, a Panel Session was held with the title: 'Heat Transfer in the Last Decade—What did we accomplish? What remains to be done?' The session was in a way a follow up of panel sessions in Versailles (1970) and Tokyo (1974) in which attempts were made to outline the most pressing problems for future research in heat transfer. The session was well attended by representatives from all over the world. Those present were most generous in their active participation in the proceedings. In addition most of those who did address the panel confirmed their statements in writing and some who were not able to attend provided written comments. In the following an attempt will be made to summarize the views that were expressed and to convey a feeling for the spirit and the tenor of the meeting. This report therefore is of the nature of 'minutes of a meeting' and does not presume to represent a comprehensive or fully balanced account of all past achievements and future needs. (no refs.)

69849 A history of violin research. C.M.Hutchins (Catgut Acoustical Society Inc., Montclair, NJ, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1421-40 (May 1983).
From the probable origins of the violin in the early 16th century there is a long history of experimentation; first, the empirical development of the violin by the makers themselves over more than 200 years to its height of excellence in the late 17th and early 18th centuries; then the scientific investigations of its vibrational characteristics which have been done since the early 19th century. These have progressed in spurts of activity associated with technological innovations, particularly the developments of increasingly sensitive measuring equipment. This paper attempts to cover briefly the work of the early mathematicians as well as that of Savart, Helmholtz, and Rayleigh as related to the violin; then considers the research of the 20th century from the pre-electronic investigations of Raman, Miller, and Fuhr, through the spate of activity in violin research from 1930 to 1960 particularly in Germany, the USA, and Japan; and finally a brief overview of the many current developments associated with today's electronic and optical technologies, along with the concept of the violin as a musical instrument involving research in fields as widely separated as psychoacoustics, musical composition and performance, materials research, vibration analysis, and violin making. (193 refs.)

69850 The foundations of solid state physics. N.Mott.
Natl. Electron. Rev. (GB), vol.18, p.21-3 (1983).
The author discusses the application of the ideas of modern atomic physics to many problems, mainly in the fields of semiconductors and metals, photographic emulsion and corrosion. He has specialised in solids for 50 years since being appointed professor of theoretical physics at Bristol in 1933. He was Cavendish Professor of Physics, Cambridge University, from 1954 to 1971. He has been a Fellow of the Royal Society since 1936 and was awarded the Nobel Prize for Physics in 1977. (no refs.)

01.70 PHILOSOPHY OF SCIENCE

69852 The assessment of auxiliary hypotheses. J.Leplin (Univ. of North Carolina, Greensboro, NC, USA).
Br. J. Philos. Sci.(GB), vol.33, no.3, p.235-49 (Sept. 1982). [received: April 1983]
The following hypotheses have figured prominently in discussions of the legitimacy of recourse to auxiliary hypotheses to protect theories from falsification: The Contraction Hypothesis: Lorentz's postulation in 1892 of a contraction of solid bodies in the direction of their motion through the ether; used to block the derivation from the Lorentz electron theory of second order effects of the earth's motion so as to accommodate the Michelson-Morley null result. The Neutrino Hypothesis: Pauli's postulation in 1930 of a new particle accompanying the electron ejected from radioactive nuclei in beta decay; used to reconcile the continuous energy spectrum of beta decay with strict conservation of energy. The Hypothesis of a Trans-Uranian Planet: Adams's postulation in 1844 and Leverrier's in 1846 of a new planet to account for perturbations of Uranus. The Hypothesis of Intra-Mercurial Matter: Leverrier's postulation in 1856 of a new planet and subsequently of new planetoids or other perturbing matter to account for excessive precession of the perihelion of Mercury. In each case a developed, successful theory confronted by an empirical anomaly was modified so as to incorporate consistently a new hypothesis which removed the anomaly. Each new hypothesis immediately posed problems of independent testability. Scientists tend not to believe a problem has been solved, or solved adequately, until they believe that evidence for hypotheses which would provide a solution warrants belief in those hypotheses. Belief in the plausibility or likelihood of the hypotheses themselves is insufficient; what must be believed is that such belief is suitably confirmed. Otherwise the problem remains, although perhaps as one to approach through experimentation rather then further theorising. (12 refs.)

69853 Relational concepts of space and time. J.B.Barbour (Istituto di Fisica Teorica, Univ. di Pavia, Pavia, Italy).
Br. J. Philos. Sci.(GB), vol.33, no.3, p.251-74 (Sept. 1982). [received: April 1983]
According to Leibniz, space is not something substantial but is merely the order of coexisting things; similarly, time is merely the successive order of things. Historically, this view was opposed by Newton, with his concepts of absolute space and absolute time. It was clear to Newton—but perhaps not so clear to Leibniz—that a distinction between his absolute concepts and Leibniz's relational concepts becomes meaningful only at the level of dynamical theories of motion. Indeed, Weyl [1949], who inclines more to the Newtonian point of view, concedes that at the level of kinematics the relationist standpoint is irrefutable. The argument therefore hinges on the ability of the rival camps to formulate dynamical laws of motion. Here, the epistemological cogency of the relationist camp at the level of kinematics has been seriously weakened by its inability hitherto to construct genuinely relational theories of motion. The author attempts to identify the philosophical principles which are fundamental to the relationist case and show how they lead one, on the one hand, to epistemological doubts about the conventional conceptual framework of Newtonian and Einsteinian dynamics and, on the other, how they can be used positively in the construction of an alternative relationist framework. (21 refs.)

69854 The role of mathematics in physics. C.S.Sharma (Birkbeck Coll., Univ. of London, London, England).
Br. J. Philos. Sci.(GB), vol.33, no.3, p.275-86 (Sept. 1982). [received: April 1983]
The author's main contention is that it is imperative that physicists should modernise their knowledge of mathematics. In order to explain why this is so, it is necessary to examine what mathematics is and what its role in physics is. Few mathematicians or physicists are ever told what mathematics is—it is assumed to be what they learn in their mathematics courses. This is most unsatisfactory, particularly because students of modern mathematics are repeatedly told that in mathematics existence is synonymous with freedom from contradictions and in mathematics only those things or concepts exist which can be defined in a contradiction-free way. This is not to say that no one has ever attempted to define mathematics: on the contrary as is well-known there are tomes written on the definition and the philosophy of mathematics. It seems that there is no universal agreement even among the experts about the definition of mathematics and its role in other disciplines. (20 refs.)

01.75 SCIENCE AND SOCIETY

69855 Public perceptions of seismic hazards and critical facilities. D.S.Mileti (Colorado State Univ., Fort Collins, CO, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S13-18 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Public perceptions of seismic hazards rarely conform to common sense. Public perceptions are even more difficult to second guess when critical facilities are introduced into the equation. The public is typically biased in its perception of seismic hazards probabilities. These perceptions most characterize a public who do recognize that a generic earthquake risk exists; however, few members of that public personalize that risk and do much about it. Public perceptions of seismic hazards in reference to critical facilities follow suite with one exception. This exception is controversial critical facilities. On this front, the typical social and psychological factors and processes that form public seismic hazards perceptions are joined by several others. This paper reviews and summarizes the key factors that are the causes of public perceptions of seismic hazards in general, and in reference to noncontroversial and controversial critical facilities in particular. (16 refs.)

02.30 FUNCTION THEORY, ANALYSIS

69857 The quadratic bundle of a general form and the nonlinear evolution equations. I. Expansions over the 'squared' solutions: generalized Fourier transform. V.S.Gerdjikov, M.I.Ivanov.
Bulg. J. Phys. (Bulgaria), vol.10, no.1, p.13-26 (1983).
The completeness relation for the system of 'squared' solutions $\{\bar{\Psi}\}$ of the quadratic bundle $L(\lambda)$ of a general form is proved. The integro-differential operator Λ for which the elements of $\{\bar{\Psi}\}$ are eigen-and adjoint-functions is explicitly calculated. The interrelation between the set of potentials of $L(\lambda)$ and the set of scattering data is shown to have the meaning of a generalized Fourier transform over the system $\{\Psi\}$. Compact expressions for the trace identities of $L(\lambda)$ through the operator Λ are obtained. (35 refs.)

69858 Coupled nonlinear stochastic differential equations. G.Adomian (Center for Appl. Math., Univ. of Georgia, Athens, GA, USA), L.H.Sibul, R.Rach.
J. Math. Anal. & Appl. (USA), vol.92, no.2, p.427-34 (15 April 1983).
Systems of n coupled linear or nonlinear differential equations which may be deterministic or stochastic are solved by methods of the first author and his coworkers. Examples include two coupled Riccati equations, coupled linear equations, stochastic coupled equations with product terms, and n coupled stochastic differential equations. (7 refs.)

69859 Computation of Sturm-Liouville eigenvalues via Lagrangian interpolation. F.Calogero (Dipartimento di Fisica, Univ. di Roma, Rome, Italy).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.1, p.9-16 (7 May 1983).
A technique is presented for computing the eigenvalues λ_m of the regular Sturm-Liouville problem $d_2(x)\psi_m''(x)+d_1(x)\psi_m'(x)+d_0(x)\psi_m(x)=\lambda_m\psi_m(x)$, $\psi_m(b)=\psi_m(c)=0$. They are approximated by the ${}_m\psi_m(x)$, $\psi_m(b)=\psi_m(c)=0$. They are approximated by the eigenvalues $\lambda_m=\lambda_m-\delta\lambda_m$ of a $(n\times n)$-matrix A, given by a simple explicit formula in terms of the three functions $d_p(x)$ evaluated at n (arbitrary) points x_j, and of the distances of these points from the boundaries b and c. The rate of convergence as $n\rightarrow\infty$ is estimated to be quite fast, as suggested by the formula, applicable for equally spaced x_j's in the interval (b,c), $|\delta\lambda_m/\lambda_m|\sim(\pi m/2n)^{n-2}$. (3 refs.)

69860 Quasiconformal deformations of an arbitrary Riemann surface and variational formulas. F.Maitani (Coll. of Technol., Kyoto Tech. Univ., Kyoto, Japan).
Mem. Fac. Ind. Arts Kyoto Tech. Univ. Sci. & Technol. (Japan), vol.31, p.83-96 (Dec. 1982). [received: May 1983]
The purpose of this paper is to give variational formulas for Riemann's period matrices and certain kinds of meromorphic differentials on an arbitrary open Riemann surface which is deformed by quasiconformal homeomorphisms depending on a complex parameter. As the quasiconformal deformation the author considers Riemann surfaces with conformal structures decided by Beltrami differentials depending holomorphically on a complex parameter. For the sake of discussion on general open Riemann surfaces the author introduces a notion of behaviour spaces in the Hilbert space of first order differential forms. The mapping induced from a quasiconformal homeomorphism preserves the behaviour space. The variational formulas are valid for the class of meromorphic differentials restricted by the behaviour space. He shows examples that each element of the period matrix is holomorphic if branch points and boundary curves vary holomorphically on a converging surface of the complex plane. (14 refs.)

69861 Linearization of nonlinear differential-difference equations. F.W.Nijhoff, G.R.W.Quispel, H.W.Capel (Inst. Lorentz voor Theoretische Natuurkunde, Leiden, Netherlands).
Phys. Lett. A (Netherlands), vol.95A, no.6, p.273-6 (9 May 1983).
A new linear integral equation is proposed, yielding an exact linearization of the integrable discrete versions of e.g. the nonlinear Schrodinger equation, the isotropic Heisenberg spin chain and the complex sine-Gordon equation. The Backlund transformation is discussed, as well as a discrete version of the anisotropic Heisenberg spin chain. (14 refs.)

02.60 NUMERICAL APPROXIMATION AND ANALYSIS

69862 The stochastic method for numerical simulations: higher order corrections. I.T.Drummond, S.Duane, R.R.Horgan (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220 (FS8), no.1, p.119-36 (16 May 1983).
The authors derive discrete versions of stochastic differential equations governing the evolution of some random variable $x(t)$ to arbitrary order in Δt, giving explicit formulae to second order. These are tested in the static case by examples where x takes values in the groups U(1) and SU(2). (2 refs.)

03.00 CLASSICAL AND QUANTUM PHYSICS; MECHANICS AND FIELDS

03.20 CLASSICAL MECHANICS OF DISCRETE SYSTEMS: GENERAL MATHEMATICAL ASPECTS

(for applied classical mechanics of discrete systems, see 46.10; for celestial mechanics, see 95.10)

69863 Approximation and numerical solution of contact problems with friction. J.Haslinger, M.Tvrdy.
Apl. Mat. (Czechoslovakia), vol.28, no.1, p.55-71 (1983).
There are many problems in which one deformable body comes into contact with another. Contact problems are nonclassical in the sense that they cannot be directly formulated as usual boundary value problems. The reason for this is the fact that neither the contact surface nor the distribution of contact forces are known a priori. It is well known that the mathematical formulation leads to variational inequalities. The aim of this paper is to study the approximation and the computation of contact problems between an elastic body and a rigid foundation, taking into account the influence of friction on the contact surface. The simplest model involving friction, namely that with 'a given friction', is analysed. The importance of this model is that it serves as an auxiliary problem, by means of which contact problems with friction obeying the classical Coulomb law can be approximated. The main attention is paid to the modification of Uzawa's algorithm, using specific features of the problem. (10 refs.)

69864 Spatial constrained mechanical system kinematic analysis employing a computer for generation of a mathematical model program OKAM. V.Brat, V.Pavlik, V.Stejskal (Tech. Univ., Karlovo, Praha, Czechoslovakia).
Acta Tech. CSAV (Czechoslovakia), vol.28, no.1, p.93-1087 (1983).
A kinematic analysis of spatial constrained mechanical systems (CMS), which employs a digital computer is presented. A theoretical basis of solution represents a basic matrix method. The OKAM program based upon this method enables the computer to assemble a mathematical model of the problem, i.e. a system of kinematic equations of motion of a concrete CMS, namely in a general (analytical) form. As input information, a simple symbolic equation expressed in basic matrices is employed. On substituting the respective input data values, the OKAM system can carry out a numeric solution to the system of equations with an incidental graphic output. Thus the paper represents a contribution to an automatic program generation for kinematic solution to concrete CMS. Two applications are presented. (7 refs.)

69865 Modal analysis for linear damped systems with many degrees of freedom. Fang Tong (Northwestern Polytech. Inst., China).
Acta Mech. Solida Sin. (China), no.3, p.312-16 (1981). In Chinese.
Discrete linear nonconservative systems with unsymmetrical matrices are considered. By making use of the properties of the adjoining matrices, the complex modal expansion formula for the transfer function matrix has been derived with ease. (6 refs.)

69866 Response of two-degree-of-freedom systems to multifrequency parametric excitations. A.H.Nayfeh (Dept. of Engng. Sci. & Mech., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
J. Sound & Vib. (GB), vol.88, no.1, p.1-10 (8 May 1983).
The method of multiple scales is used to analyze the response of two-degree-of-freedom systems to multifrequency parametric excitations. The equations describing the modulation of the amplitudes with time are derived for the case of four simultaneous resonances: main resonances of the two modes, combination resonance of the difference type, and combination resonance of the summed type. When only two simultaneous resonances exist, the modulation equations can be transformed into a system of four real first-order differential equations with constant coefficients whose solution depends on the eigenvalues of a four by four constant coefficient matrix. When three or more simultaneous resonances exist, the modulation equations cannot be made autonomous, in general, and hence one may not be able to solve them except numerically. (15 refs.)

69867 Dynamical behaviour of an oscillator sustained by an intermittent mechanism. F.Badrakhan (Coll. of Engng. & Petroleum, Kuwait Univ., Kuwait).
J. Sound & Vib. (GB), vol.88, no.1, p.27-36 (8 May 1983).
A new method for studying the dynamical behaviour of an oscillator sustained by an intermittent mechanism is presented. Graham escapement is considered as a typical model for such a mechanism. A new form given to the equation of motion permits the study of the natural frequency of the system, the establishment of a first integral in the case of a free motion and the analysis of effects of external harmonic or random perturbations. (10 refs.)

69868 Inertia in simple body models. J.Lubliner (Dept. of Civil Engng., Univ. of California, Berkeley, CA, USA).
Mech. Res. Commun. (GB), vol.10, no.1, p.1-7 (Jan.-Feb. 1983).
Introduces inertia as an element of an abstract simple body model in such a way that all the classical inertial quantities (mass, linear and angular momentum, kinetic energy) are derived from it. The classical monopolar inertia is identified as a special case, and it is shown that it is the only possible inertia when the only force systems allowed are measured. The more general inertia is then used to derive the inertial force system. An application is made to the laws of motion. (4 refs.)

69869 Note on linear systems derivable from a variational principle. W.Sarlet (Inst. voor Theoretische Mechanica, Rijksuniv. Gent, Gent, Belgium).
Phys. Lett. A (Netherlands), vol.95A, no.2, p.72-5 (18 April 1983).
This paper is a complementation of a previous one (see Int. J. Eng. Sci., vol.20, p.55, 1982) in which the author studied the problem of converting general linear second-order equations into Euler-Lagrange equations through multiplication by a time-dependent matrix. The present paper discusses the possibility of having multipliers depending on coordinates and velocities too. (8 refs.)

69870 Superintegrability of the Calogero-Moser system. S.Wojciechowski (Inst. of Theoretical Phys., Univ. of Warsaw, Warsaw, Poland).
Phys. Lett. A (Netherlands), vol.95A, no.6, p.279-81 (9 May 1983).
It is shown here that the classical Calogero-Moser system of N particles and its higher flows are superintegrable in the sense that they have $2N-1$ global, functionally independent, single-valued integrals of motion not depending explicitly on time. (5 refs.)

69871 Quasiinvariant gyroscopic systems. S.P.Sosnitskii (Inst. of Math., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.657-60 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.98-101 (July 1982). [received: March 1983] (3 refs.)

69872 Rapid rotation of a heavy gyrostat about a fixed point in a resisting medium. L.D.Akulenko, D.D.Leshchenko (Inst. of the Problems of Mech., Acad. of Sci., Moscow, USSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.660-5 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.102-7 (July 1982). [received: March 1983]
Considers an asymmetric heavy rigid body with a spherical cavity filled with a high-viscosity liquid rotating rapidly about a fixed point in a weakly resisting medium. The authors call motions rapid when the moment of the applied forces about the fixed point is small in comparison with the instantaneous value of the kinetic energy of rotation. (14 refs.)

69873 Optimum reorientation of elastic system with constraints on angular velocity. A.E.Zakrzhevskii (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.666-70 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.108-13 (July 1982). [received: March 1983]
Reorientation of a free solid body in inertial space is one of the modes of programmable motion of interest for technical applications. Such a maneuver can, for instance, be effected by a single rotation about an Euler axis stationary in inertial space and in a system of coordinates tied to the body. In this study the author considers the problem of determining the optimum programmable law of varying the angular displacement of a solid body with attached elastic elements about the axis of rotation, to ensure the necessary quality of dynamic processes in the elastic elements under constraints on the angular velocity of rotation in the case of uniaxial orientation. (5 refs.)

69874 A note on the theory of conservative vibrations with path symmetry. R.Frischbier (Martin-Luther-Univ., Halle, Germany).
Z. Angew. Math. & Mech. (Germany), vol.63, no.3, p.212-3 (1983). In German.
Presents an approximation method for the solution of functions like $\ddot{s}(t)=-h(s)$, where $t_0=4\int_{s0}^{s1}[H(s_1)-H(s)]^{-1/2}\,ds$ and $H(s)=2\int_0^s h(s)ds$. An exact solution cannot be found for the general case but an approximation can be obtained in a simple manner. The solution is applied to Hertz's impact equation and to the mathematical pendulum. 03.30 SPECIAL RELATIVITY

69875 The formalism of contact for classical mechanics and relativity. J.Bryant (Lab. de Mecanique Theorique, Univ. de Besancon, Besancon, France).
Ann. Inst. Henri Poincare Sect. A (France), vol.38, no.2, p.121-52 (1983). In French.
A more general formulation of Hamiltonian mechanics can be given using the notion of exact canonical manifold introduced by Lichnerowicz. A traditional problem, the N-Body problem, is considered from this viewpoint. Furthermore, relativistic mechanics can be formulated in this framework. (9 refs.)

69876 Is the unidirectional speed of light observable?. Y.Z.Zhang (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).
Phys. Lett. A (Netherlands), vol.95A, no.5, p.225 (2 May 1983).
It is pointed out the unidirectional velocity of light is not directly observable. The proposed method by Aspden (see ibid., vol.92, p.165, 1982) cannot be used to measure the first-order speed of light anisotropy. (5 refs.)

69877 A proposed observational test of six-dimensional relativity. E.A.B.Cole (Dept. of Appl. Math. Studies, Univ. of Leeds, Leeds, England).
Phys. Lett. A (Netherlands), vol.95A, no.6, p.282-4 (9 May 1983).
Using equations of motion for a charged particle acted on by the new electromagnetic fields allowed in six-dimensional relativity, it is shown how much a particle moving in the field of a central charge can have a space trajectory which the standard four-dimensional theory does not allow. 69878 Plane dynamic problems for elastic incompressible bodies with initial stresses. S.Iu.Babich, A.N.Guz.
Appl. Math. & Mech. (USA), vol.46, no.2, p.197-204 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.263-71 (1982).
The plane dynamic problems are considered when the original dynamic problems admit reduction to steady state problems in a system of coordinates in rectilinear motion at constant velocity. The investigation is carried out using relations of the linearized theory of elasticity. Complex potentials are introduced for equal and unequal roots of the controlling equation with potentials of arbitrary form. A method of obtaining exact solutions using complex potentials is indicated in the case of bodies with initial stresses. Values of complex parameters are presented for bodies with elastic potential of specific form. (27 refs.)

69879 Sources of stress in two half-spaces. V.P.Kochurov.
Appl. Math. & Mech. (USA), vol.46, no.2, p.205-9 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.272-7 (1982).
Solutions are given for two versions of the problem of displacements from a source of stresses (the domain of displacement or stress field peculiarities) in two isotropic linearly elastic half-spaces, on whose plane boundaries conditions relating the boundary values of the derivatives of the displacements of different orders are satisfied. The method of solution proposed permits the displacement in the half-spaces to be expressed in terms of indefinite integrals of the gradients of the displacements produced by the stress source in an unbounded homogeneous medium. (10 refs.)

69880 Optimality conditions in axisymmetric problems of elasticity theory. S.B.Vigdergauz.
Appl. Math. & Mech. (USA), vol.46, no.2, p.210-13 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.278-82 (1982).
The result of the optimality of equi-stressed contours in a loaded plane is extended to the case of a space with cavities that are axisymmetric. Boundary conditions are found to determine the shape of the optimal cavities, the inverse axisymmetric problem of elasticity theory, and its analytic solution is obtained in the case of a single cavity. (8 refs.)

69881 On inequalities of Korn, Friedrichs and Babuska-Aziz. C.O.Horgan (Michigan State Univ., East Lansing, MI, USA), L.E.Payne.
Arch. Ration. Mech. & Anal. (Germany), vol.82, no.2, p.165-79 (1983).
Korn's inequalities for integrals of quadratic functionals subject to certain side conditions have played a fundamental role in the development of elasticity theory. The Korn inequalities are essential in establishing coerciveness of the differential operators of linear elastostatics and thus form the basis for existence results in that theory. Among other areas in elasticity where consideration of Korn's inequalities arise the authors cite, for example, fundamental studies on the mathematical foundations of finite elements, stability theory and qualitative analyses of solution behavior, such as those involved in the investigation of Saint-Venant's principle. In the latter two areas of application in particular, information on the optimal constants appearing in the inequalities, the Korn constants, is of importance. Thus several investigations have been concerned with evaluating the Korn constants for specific domains and with obtaining bounds for these constants. The authors' purpose is to draw attention to an equivalence, for two-dimensional simply-connected domains, between Korn's inequality (in the second case) and two other inequalities for quadratic functionals which have received comparatively little attention in the literature. (24 refs.)

69882 A transformation model of generalized two-dimensional problems of linear elasticity in nonhomogeneous anisotropic medium. Jin Fu-sheng (Changjiang River Shipping Sci. Res. Inst., China).
Acta Mech. Solida Sin. (China), no.3, p.374-9 (1981). In Chinese. (2 refs.)

69883 Geometrically nonlinear formulation for the axi-symmetric transition finite elements. K.S.Surana (McDonnell Douglas Automation Co., Saint Louis, MO, USA).
Comput. & Struct. (GB), vol.17, no.2, p.243-55 (1983).
Presents a geometrically nonlinear formulation for the axi-symmetric transition finite elements using total Lagrangian approach. The basic element is formulated using properties of the axi-symmetric solids and the axi-symmetric shells. A novel feature of the formulation is that the restriction on the magnitude of the rotations for the shell nodes of the transition element is eliminated. This is accomplished by retaining true nonlinear functions of nodal rotations in the definition of the element displacement field. Such transition elements are essential for geometrically nonlinear applications requiring both axi-symmetric solids and the axi-symmetric shells. They ensure proper connection of the axi-symmetric solid portion of the structure to the shell-like portion of the structure. It is shown that the selection of different stress and strain components at the integration points does not effect the overall linear response of the element. However, in the geometrically nonlinear formulation, it is necessary to select appropriate components of the stresses and the strains at the integration point for accurate and converging element behavior. Numerical examples are presented to demonstrate such characteristics of the transition elements. (15 refs.)

69884 An approximate nonlinear design procedure for partially prestressed concrete beams. A.E.Naaman (Dept. of Materials Engng., Univ. of Illinois, Chicago, IL, USA).
Comput. & Struct. (GB), vol.17, no.2, p.287-99 (1983).
The theoretical basis and the main results of an approximate nonlinear design procedure, which attempts to predict the behavior at ultimate of prestressed and partially prestressed concrete member, is presented. Difficulties encountered in simulating the actual behavior of concrete and steel are discussed. Particular emphasis is put on comparing the various available stress-strain relationships for prestressing steels, and observed variability in their actual properties. Recommended equations and corresponding coefficients are given. Typical results showing the influence on ultimate behavior of major variables such as the type and amount of prestressing steel, the amount of nonprestressed tensile and compressive reinforcement, and the ultimate concrete compressive strain are presented and compared with code derived results. They help point out where the code recommendations, if used, may lead to an unsafe design and what modifications may be needed to make them more representative of observed trends. (27 refs.)

69885 Structural analysis by a combined finite element-transfer matrix method. M.Ohga (Dept. of Civil Engng., Ehime Univ., Matsuyama, Japan), T.Shigematsu, T.Hara.
Comput. & Struct. (GB), vol.17, no.3, p.321-6 (1983).
The combined finite element-transfer matrix method has the advantage of reducing the size of a matrix to less than that obtained by the ordinary finite element method. The analytical procedure in this method for bending and buckling problems are described, and techniques for treating the structure with intermediate conditions are proposed. Various numerical examples of these problems are shown to demonstrate the efficiency and accuracy of this method. The results from these examples agree well with those obtained by the finite element method and others. (10 refs.)

69886 Operator split methods in the numerical solution of the finite deformation elastoplastic dynamic problem. P.M.Pinsky (Div. of Engng., Brown Univ., Providence, RI, USA), M.Ortiz, R.L.Taylor.
Comput. & Struct. (GB), vol.17, no.3, p.345-59 (1983).
The spatial formulation of the elastoplastic problem for finite deformations is considered. A thermodynamic argument leads to an additive decomposition of the spatial rate of deformation tensor and allows an operator split of the evolutionary equations of the problem into 'elastic' and 'plastic' parts. This operator split is taken as the basis for the definition of a global product algorithm. In the context of finite element discretization the product algorithm entails, for every time step, the solution of a nonlinear elastodynamic problem followed by the application of plastic algorithms that operate on the stresses and internal variables at the integration points and bring in the plastic constitutive equations. Suitable plastic algorithms are discussed for the cases of perfect and hardening plasticity and viscoplasticity. This formalism does not depend on any notion of smoothness of the yield surface and is applicable to arbitrary convex elastic regions, with or without corners. The stability properties of the global product algorithm are identical to those of the algorithm used for the integration of the nonlinear elastodynamic problem. Numerical examples illustrate the accuracy of the method. (34 refs.)

69887 Existence of temperature and entropy of a continuous medium and its consequences on the elastic part of the stress tensor. H.Gouin, F.Gouin (Faculte des Sci. et Techniques de Saint-Jerome, Marseille, France).
Mech. Res. Commun. (GB), vol.10, no.1, p.21-6 (Jan.-Feb. 1983).
It is now a classical point of view to extend thermodynamics into continuum mechanics. The usual mathematical methods lead to the balance equations and the Clausius-Duhem inequality. The authors envisage a thermomechanical process as described by the motion of the continuous medium, the stress tensor, the specified internal energy, the body force, the heat flux vector and the heat supply. The two conservation laws: the law of balance of linear momentum and the law of balance of energy (the first law of thermodynamics) are satisfied. (19 refs.)

69888 On elastoplastic analysis by boundary elements. G.Maier (Dept. of Structural Engng., Tech. Univ., Milan, Italy).
Mech. Res. Commun. (GB), vol.10, no.1, p.45-52 (Jan.-Feb. 1983).
The discretized incremental elastoplastic BV problem is formulated in terms of plastic multiplier and yield function rates only. By means of computationally inexpensive 'consistent' modelling over cells, the matrix which transforms plastic strains into stresses is shown to become symmetric and positive seminegative up to the discretization errors. After the symmetrization of this matrix, two dual extremum theorems are established for the elastoplastic rate solution. (8 refs.)

69889 **Investigation of numerical methods for solving the N-S equations.** Ma Yau-wen.
Math. Numer. Sin. (China), vol.5, no.1, p.79-89 (1983). In Chinese.
Two difference schemes are proposed for reducing the oscillations near the shock in solving the Navier-Stokes equations. One is a scheme using a time increment parameter, the other is a one-step difference scheme with an adjustable parameter. Numerical experiments show that the schemes proposed are useful. (12 refs.)

69890 **Classification of difference schemes of gas dynamics by the method of differential approximation. I. One-dimensional case.** N.N.Yanenko, Z.I.Fedotova, L.A.Tusheva, Yu.I.Shokin (Inst. for Pure & Appl. Mech., Acad. of Sci., Novosibirsk, USSR).
Comput. & Fluids (GB), vol.11, no.3, p.187-206 (1983).
One-dimensional difference schemes are described for 'across'-computations of ideal gas dynamics problems. Their classification in definite properties is given. This classification is based on the method of differential approximation, i.e. some characteristics of difference schemes are to be defined with the help of appropriate characteristics of the differential approximation. The most important properties of the difference schemes considered are represented in special tables. (38 refs.)

69891 **On two upwind finite-difference schemes for hyperbolic equations in non-conservative form.** B.Gabutti (Istituto di Calcoli Numerici, Univ. Degli Studi di Torino, Torino, Italy).
Comput. & Fluids (GB), vol.11, no.3, p.207-30 (1983).
Several finite difference-schemes for approximating solutions of initial value problems associated with systems of linear hyperbolic differential equations are considered. Common features of the schemes is the approximation of the space-like derivatives according to the behavior of the characteristics (upwind schemes for hyperbolic equations). The analysis of standard properties (consistency, stability, convergence, dissipativity, phase error) of finite difference schemes is performed. In addition, extensions of certain upwind schemes to nonlinear equations, extensions to several space-like dimensions by splitting methods and two implicit finite difference schemes are considered. (30 refs.)

69892 **On the construction of *K*-consistent difference schemes of gas dynamics.** E.V.Vorozhtsov, N.N.Yanenko (Inst. of Theoretical & Appl. Mech., Acad. of Sci., Novosibirsk, USSR).
Comput. & Fluids (GB), vol.11, no.3, p.231-49 (1983).
Previously it was found by the present authors that the use of non-classical equations of state in gas dynamic computations by Eulerian difference schemes may give rise to spurious oscillations of the numerical solution in the vicinity of contact discontinuities. Two accurate methods for elimination of these oscillations are now proposed. One of these methods is based on a new definition of the *K*-consistency of difference schemes. Another method makes use of difference approximations of an unsteady equation for pressure which is a well-known consequence of the Euler equations. The effectiveness of the methods proposed is illustrated by computational results. (14 refs.)

69893 **An implicit predictor-corrector method for real space Chebyshev pseudospectral integration of parabolic equations.** R.S.Hirsh, T.D.Taylor, M.M.Nadworny (Appl. Phys. Lab., John Hopkins Univ., Laurel, MD, USA).
Comput. & Fluids (GB), vol.11, no.3, p.251-4 (1983).
Severe restrictions are imposed by the use of Chebyshev pseudospectral methods for the solution of parabolic problems if standard time integration techniques are utilized. For example, explicit time differencing methods give a stability restriction of $\Delta t=0(1/N^4)$ where Δt is the time step and N is the number of Chebyshev interpolation points. This is a much more restrictive requirement on Δt than that of standard finite difference methods which can be expressed as $\Delta t=0(1/N^2)$. However, for parabolic problems, time steps much larger than the characteristic diffusive time are desirable, and hence, implicit methods are essential. The authors propose a finite difference predictor/spectral corrector (FDP/SC) iteration scheme which allows time steps not restricted by the explicit diffusive stability limit. (8 refs.)

69894 **Hydrodynamic boundary conditions from kinetic theory.** V.Protopopescu, T.Keyes (Sterling Chem. Lab., Yale Univ., New Haven, CT, USA).
Phys. Lett. A (Netherlands), vol.95A, no.3-4, p.139-42 (25 April 1983).
A simple tagged particle kinetic equation is studied in the presence of a wall, where the boundary conditions may be reflecting, absorbing, or a mixture thereof. A diffusion equation is derived from the kinetic equation via the scaling, $t \rightarrow t/\epsilon^2$, $x \rightarrow x/\epsilon, \epsilon \rightarrow 0$. To $O(\epsilon^0)$, the boundary conditions on the diffusion equation are found to be Neumann for pure reflection and Dirichlet if any absorption is present. To $O(\epsilon)$, a mixed or 'radiative' boundary condition is obtained, which may be interpreted in terms of a Dirichlet condition at an extrapolated length, $O(\epsilon)$, inside the wall. (12 refs.)

03.40K Waves and wave propagation: general mathematical aspects

(see also 46.30M Mechanical and elastic waves, 43.20 General linear acoustics)

69895 **Analysis of some Korteweg-de Vries systems.** A.Ya.Spasov, P.G.Georgiev (Inst. of Electronics, Bulgarian Acad. of Sci., Sofia, Bulgaria).
Bulg. J. Phys. (Bulgaria), vol.10, no.1, p.36-41 (1983).
Waves in a system described by the second Kakutani-KdV equation have been considered. The results obtained are in agreement with Green's law. Nonlinear wave interaction has also been considered. Solitons have been treated as an example. Approximate analytical expressions have been obtained. (14 refs.)

69896 **High order accurate difference schemes for KdV-Burgers-RLW equations.** Wu Hua-mo (Computing Center, Acad. Sinica, China), Guo Ben-yu.
Math. Numer. Sin. (China), vol.5, no.1, p.90-8 (1983). In Chinese.
A fourth order accurate difference scheme for the KdV-Burgers-RLW equations is proposed. The proof of stability and convergence, and error estimation of this scheme is given. The new nonelastic character of 2-soliton collision for the RLW equations is illustrated. (17 refs.)

69897 **Solving one class of paired integral equations in problems on diffraction theory.** T.M.Akhmedov, E.I.Veliev.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.3, p.54-7 (1983). In Ukrainian.
A method is suggested for solving paired integral equations with infinite limits of integration which appear in various diffraction theory problems. After a partial inversion of an integral operator the initial paired equations are reduced to solving linear algebraic second-kind Fredholm equations solvable with any preset accuracy. (4 refs.)

69898 **A kink-antikink soliton propagating with varying velocity.** P.C.W.Fung, C.Au (Phys. Dept., Univ. of Hong Kong, Hong Kong).
J. Phys. A (GB), vol.16, no.8, p.1611-21 (1 June 1983).
Using their previous KdV solution (1982), the authors apply a Backlund transformation to obtain new sets of solutions to another nonlinear equation $y_t+y_{xxx}-6y^2y_x+6y_x=0$ based on theorems deduced recently. The solutions to the above equation can be separated into three categories: $\lambda>0$, $\lambda=0$, $\lambda<0$. When $\lambda=0$, the above equation becomes the modified KdV (MKdV) equation. From these solutions ($\lambda\neq0$), they have also obtained new solutions (which also contain a non-zero parameter λ) to the standard MKdV equation. They analyse in detail the solutions for the cases $\lambda>0$ and $\lambda=0$. Many numerical examples are given to illustrate the main features of some of the new solutions. (4 refs.)

69899 **Hamiltonian structure of Sato's hierarchy of KP equations and a coadjoint orbit of a certain formal Lie group.** Y.Watanabe (Hiroshima Univ., Hiroshima, Japan).
Lett. Math. Phys. (Netherlands), vol.7, no.2, p.99-106 (March 1983).
A Hamiltonian operator related to Sato's hierarchy of KP equations is derived. The KP equation is regarded as the Hamiltonian equation of motion on a coadjoint orbit of a certain formal Lie group. (7 refs.)

69900 **On equations for wave interactions.** V.K.Mel'nikov (Lab. of Theoretical Phys., JINR, Dubna, USSR).
Lett. Math. Phys. (Netherlands), vol.7, no.2, p.129-36 (March 1983).
A number of new nonlinear evolution equations for the interaction of waves on the x, y plane are found. It is shown that these equations may be investigated by the inverse scattering method. (13 refs.)

69901 **On a growing mode of the Boussinesq equation.** N.Yajima (Res. Inst. for Appl. Mech., Kyushu Univ., Fukuoka, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.678-80 (Feb. 1983).
Nonlinear evolution of linearly unstable solution in the Boussinesq system is studied by Hirota's (1973) method. The result shows a peculiar property that the unstable solution neither grows unlimitedly nor falls into a saturation level, but takes the maximum amplitude at a time and thereafter damps. (4 refs.)

03.50 CLASSICAL FIELD THEORY

69902 **The electrodynamics with magnetic monopoles. II. Canonical formalism.** K.Hirata (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.636-52 (Feb. 1983).
For pt.I see ibid., vol.69, no.1, p.300-13 (1983). A relativistic classical Hamiltonian theory of the electrodynamics with electric and magnetic point particles is constructed from a Lagrangian theory by the canonical method. The resulting Hamiltonian theory has a duality symmetry, though this is not easy to see in the Lagrangian theory. This, so to speak, Dirac-Wu-Yang theory may be regarded as a refined version of the Wu-Yang theory. (10 refs.)

69903 **Behaviour of a neutral particle with spin in an axial magnetic field.** S.V.Sorokin, V.Ya.Epp (Lenin Komsomol Pedagogical Inst., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.645-7 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.70-2 (July 1982). [received: May 1983]
The behaviour of a neutral particle with an intrinsic magnetic moment in an axisymmetric constant magnetic field is considered. The trajectory of the particle is found and the dynamics of the spin polarization vector in this field is found. (9 refs.)

Two potential electrodynamics for the particles carrying both the electric and magnetic charges ....See Entry 70238

Dual symmetry in classical and quantum spin theory ....See Entry 70304

03.65 QUANTUM THEORY; QUANTUM MECHANICS

(see also 05.30 Quantum statistical mechanics; for relativistic wave equations, see 11.10)

69904 On the double-well problem for Dirac operators. E.M.Harrell (Dept. of Math., Johns Hopkins Univ., Baltimore, MD, USA), M.Klaus.
Ann. Inst. Henri Poincare Sect. A (France), vol.38, no.2, p.153-66 (1983).
The authors show that the eigenvalues of a Dirac Hamiltonian with two centers of force converge to those of the Hamiltonians with only one center of force in the limit as the spacing goes to infinity. They discuss perturbation theory and show how to estimate the spread of asymptotically degenerate sets of eigenvalues. The methods are for the most part not special to Dirac operators. (16 refs.)

69905 Statistical inference and distance between states in quantum mechanics. B.Diu (Lab. de Phys. Theorique et Hautes Energies, Univ. Paris VII, Paris, France).
Ann. Inst. Henri Poincare Sect. A (France), vol.38, no.2, p.167-74 (1983).
The notion of a distance between quantum states, which was recently proposed as the basis for a general postulate to solve the relative statistical inference question in quantum mechanics, is shown to be inadequate for this purpose; in a class of simple situations (dealing with 'subjective' or 'objective' states, and with 'direct' or 'indirect' information), the new postulate leads either to non-unique answers, or to incorrect ones. (6 refs.)

69906 Odd anharmonic oscillators and shape resonances. E.Caliceti, M.Maioli (Istituto Matematico, Univ. di Modena, Modena, Italy).
Ann. Inst. Henri Poincare Sect. A (France), vol.38, no.2, p.175-86 (1983).
By adapting a stability argument of Vock and Hunziker it is proved that the Borel sum of the Rayleigh-Schrodinger perturbation expansion of any odd anharmonic oscillator $p^2+x^2+gx^{2k+1}$, $k=1, 2, \ldots$, is the limit of a sequence of resonances in the standard sense of dilation analyticity. The same method yields, for a suitable class of potentials, an existence proof of shape resonances. (10 refs.)

69907 Reassembly and time advance in reflectionless scattering. R.E.Crandall, B.R.Litt (Dept. of Phys., Reed Coll., Portland, OR, USA).
Ann. Phys. (USA), vol.146, no.2, p.458-69 (1 April 1983).
The authors show that a wave packet incident on a reflectionless potential will reassemble after the scattering event, but with its mean position always advanced in time. An exact expression for this advance is derived in terms of the bound state spectrum of the potential. They identify two physically distinct correspondence limits in which the time advance agrees with the appropriate classical formula. (12 refs.)

69908 Phase path approximations in the Feynman path integrals. P.P.Fiziev (Lab. of Theoretical Phys., United Inst. of Nuclear Studies, Dubna, USSR).
Bulg. J. Phys. (Bulgaria), vol.10, no.1, p.27-35 (1983).
The discretization of the Feynman path integrals for finite dimensional systems has been analysed and the admissible finite dimensional approximations for the paths in phase-space have been found in a general form. The widespread concept of summing over all paths is shown to be incorrect and it should be replaced by summation over a certain class of paths on a family of Mayer's surfaces. (22 refs.)

69909 On one method of approximate solution of the Liouville equations. V.Lisy, L'.Turna (Faculty of Natural Sci., Univ. of P.J. Safarik, Kosice, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.5, p.477-9 (1983).
A method of an approximate solution of the Liouville equations is proposed and the domain of its applicability is discussed. (4 refs.)

69910 Elucidation of the probabilistic structure of quantum mechanics and definition of a compatible joint probability. M.Mugur-Schachter (Lab. de Mecanique Quantique, Univ. de Reims, Reims, France).
Found. Phys. (USA), vol.13, no.4, p.419-65 (April 1983).
A new integrated view on the probabilistic organization of quantum mechanics is constructed. It is then proved that for superposition state vectors the theoretical quantum mechanical distribution for the momentum observable is devoid of operational definition, and hence cannot be the source of conditions of compatibility to be imposed upon a researched joint probability concept. A compatible joint probability is defined. (25 refs.)

69911 Correspondence between classical and quantum chaos for hydrogen in a uniform magnetic field. A.Harada, H.Hasegawa (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
J. Phys. A (GB), vol.16, no.8, p.L259-63 (1 June 1983).
It is shown, by numerical computations, that the classical and the quantal critical energy of a hydrogen atom in a uniform magnetic field, characterising the onset of irregular motions, approximately coincide. This result is obtained by applying a simple scaling property of the classical Hamiltonian, valid only for $L_z=0$ (the angular momentum component along the field vanishes), to the numerically deduced relative areas of the irregular region of Poincare surfaces of section. (17 refs.)

69912 Vector bundle representations of groups in quantum physics. M.Asorey, J.F.Carinena (Dept. de Fisica Teorica, Univ. de Zaragoza, Zaragoza, Spain), M.A.del Olmo.
J. Phys. A (GB), vol.16, no.8, p.1603-9 (1 June 1983).
The theory of vector bundle representations of Lie groups G is developed. Induced and locally operating linear representations of G are shown to be generated by vector bundle representations, and gauge equivalence of locally operating linear representations is shown to correspond to equivalence of vector bundle representations. It is pointed out that every vector bundle representation is equivalent to an induced one. Some applications to the quantum systems associated with monopole and instanton gauge field configurations are also discussed. (14 refs.)

69913 Harmonic oscillator with potential barriers—exact solutions and perturbative treatments. W.N.Mei (Dept. of Phys., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA), Y.C.Lee.
J. Phys. A (GB), vol.16, no.8, p.1623-32 (1 June 1983).
Two specific potential-well problems have been solved exactly, firstly, a half-space harmonic oscillator with a finite-potential step and secondly, a full-space harmonic oscillator with an infinite wall located at a finite distance from the origin. The purpose of these studies is to investigate the limiting situations when (i) the finite-potential step in the first case is very high compared with the energy eigenvalues of the low-lying states and (ii) the infinite-potential wall in the second case is at a great distance from the origin where the amplitudes of the wavefunctions of the low-lying states are vanishingly small. The numerical results have been compared with the analytical expressions obtained from the perturbation schemes devised by Lee and Mei. Excellent agreements are obtained. General implications and applications are also discussed. (8 refs.)

69914 *R*-matrix bounds for local potentials. A.E.A.Warburton (Dept. of Appl. Math., Univ. of Hull, Hull, England).
J. Phys. A (GB), vol.16, no.8, p.1633-9 (1 June 1983).
The continuum form of the Hellmann-Feynman theorem is proved, both on and off the energy shell, for potentials satisfying $\int_0^A r|V(r)|dr<\infty$ and $\int_A^\infty |V(r)|dr<\infty$. The corresponding bounds for the phase shifts and off-shell amplitudes are deduced. (7 refs.)

69915 Bound states of two identically charged particles in a harmonic oscillator field. V.I.Osherov, L.V.Poluyanov, A.I.Voronin (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
J. Phys. B (GB), vol.16, no.10, p.L305-8 (28 May 1983).
Complete separation of variables has been carried out for the six-dimensional Schrodinger equation of two particles interacting in a harmonic oscillator field. The dynamical symmetry of the system investigated is discussed. The degeneration of energy levels and their quasiclassical positions have been found. (4 refs.)

69916 Quantum geometry and quantum force: wave and geodesic equations. E.R.Caianiello, G.Scarpetta (Istituto di Fisica, Univ. di Salerno, Salerno, Italy), G.Marmo.
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.15, p.487-90 (9 April 1983). (9 refs.)

69917 Some possible experiments on quantum waves. J.Andrade e Silva (Lab. de Fisica, Univ. de Lisboa, Lisboa, Portugal), F.Selleri, J.P.Vigier.
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.15, p.503-8 (9 April 1983).
The authors discuss three experiments which can be performed with modern techniques and which allow one to probe directly the actual existence of quantum waves in space and time. (15 refs.)

69918 Superluminal singular dual wave. R.Horodecki (Inst. of Theoretical Phys. & Astrophys., Univ. of Gdansk, Gdansk, Poland).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.15, p.509-11 (9 April 1983).
The dual wave to the Mackinnon soliton-like wave (1978, 1981) is considered in terms of the 'three wave' hypothesis. (7 refs.)

69919 Stochastic linear maps and transition probability. P.M.Alberti, A.Uhlmann (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).
Lett. Math. Phys. (Netherlands), vol.7, no.2, p.107-12 (March 1983).
Some aspects of the transition probability $P(\omega, \nu)$ between states ω, ν on unital *-algebras are discussed. It is shown that P increases under the action of any stochastic linear map T, i.e., $P(T\omega, T\nu)\geq P(\omega, \nu)$. Some properties of P are derived in starting from a recently-proved characterization of the quantity in question. (8 refs.)

69920 Asymptotic localization and separation and the scattering of quantum states. Kay-Kong Wan, R.G.D.McLean (Dept. of Theoretical Phys., Univ. of St. Andrews, St. Andrews, Scotland).
Phys. Lett. A (Netherlands), vol.95A, no.2, p.76-8 (18 April 1983).
The concepts of asymptotic localization and separation of quantum states introduced in a previous paper are generalized to the n-dimensional case. An application of these ideas to a simple scattering situation leads to an intuitively pleasing picture of scattering. (4 refs.)

69921 Quasiclassical perturbation theory for quantum K-system. G.P.Berman, A.M.Iomin (Kirensky Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Phys. Lett. A (Netherlands), vol.95A, no.2, p.79-81 (18 April 1983).
A quantum-dynamical system satisfying the condition of stochastic instability in the classical limit is studied. Behavioural properties of perturbation-theory series in powers of $\hbar$ for such systems are discussed. The quantum corrections in the expressions for physical averages over the density matrix are shown to increase exponentially at small times. (6 refs.)

69922 Exact evaluation of a path integral with generalised memory. K.L.Sebastian (Inst. fur Phys. Chem., Univ. Munchen, Munich, Germany).
Phys. Lett. A (Netherlands), vol.95A, no.3-4, p.131-2 (25 April 1983).
A simple procedure for the evaluation of a path integral whose action contains a generalised memory term is given. It is pointed out that the procedure may also be used to evaluate path integrals involving slightly more generalised memory. (2 refs.)

69923 Reply to Lynch [Koc's thought-experiment]. Y.Koc (Bogazici Univ., Istanbul, Turkey).
Phys. Lett. A (Netherlands), vol.95A, no.3-4, p.133-4 (25 April 1983).
Lynch's alternate analysis (see ibid., vol.92, p.161, 1982) on Koc's thought-experiment is consistent with quantum mechanics. However, Lynch's analysis does not resolve the paradox which is implied by Koc's thought-experiment. (4 refs.)

69924 Correspondence limit in the Wigner-Weyl picture. T.B.Smith (Phys. Dept., Open Univ., Milton Keynes, England).
Phys. Lett. A (Netherlands), vol.95A, no.5, p.219-22 (2 May 1983).
Derives the correspondence limit matrix elements for an operator in terms of its Weyl transform. This treatment therefore can be used to estimate matrix elements for operators lacking a well-defined classical limiting form. The author gives a systematic asymptotic expansion for harmonic oscillator matrix elements. (10 refs.)

69925 Painleve property of anharmonic systems with an external periodic field. W.-H.Steeb (Univ. Paderborn, Paderborn, Germany), A.Kunick.
Phys. Lett. A (Netherlands), vol.95A, no.6, p.269-72 (9 May 1983).
The Painleve property of anharmonic systems with an external periodic field is investigated. This property tells one that the only movable singularities exhibited by the solutions are poles. The Painleve property can serve to distinguish between integrable and nonintegrable systems. (19 refs.)

69926 Comment on 'Path integration of a quadratic action with a generalized memory'. E.Bosco (Dept. of Inorganic & Phys. Chem., Indian Inst., of Sci., Bangalore, India).
Phys. Lett. A (Netherlands), vol.95A, no.6, p.277-8 (9 May 1983).
For original paper see Khandekar et al., ibid., vol.93, p.167 (1983). Using the promeasure technique, the author gives an alternative evaluation of a path integral corresponding to a quadratic action with a generalized memory. (3 refs.)

69927 Convergent perturbation expansion for the anharmonic oscillator. C.K.Au, G.W.Rogers, Y.Aharonov (Dept. of Phys. & Astron., Univ. of South Columbia, SC, USA).
Phys. Lett. A (Netherlands), vol.95A, no.6, p.287-92 (9 May 1983).
The authors study the ground state as well as the first three excited states of the anharmonic oscillator with anharmonicity λx^4 for a range of $\lambda=(0,10)$ with the first-order logarithmic perturbation iteration method (FOLPIM). This leads to convergent results. The initial choice of the wave function seems only to affect the rate of convergence in the case of the ground state but may critically affect the convergence for the excited states. For large values of λ, convergence is best obtained by choosing the asymptotic solution as the initial 'unperturbed' wave function. (29 refs.)

69928 Equivalent local potentials and Perey factors for various kinds of relative wave functions of RGM. I. Formulation. H.Horiuchi (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.516-34 (Feb. 1983).
Using the same WKB treatment as applied successfully to the non-local potential for the usual RGM relative wave function χ, the equivalent local potential and the Perey factor are derived for the other types of RGM relative wave functions $\sqrt{N}\chi$ and $N\chi$ where N is the normalization kernel. The equivalent local potentials for χ, $\sqrt{N}\chi$ and $N\chi$ are shown to be the same as each other. χ, $\sqrt{N}\chi$ and $N\chi$ have a common flux and it is compared with the flux by the equivalent local potential. Reliability of the WKB treatment is shown to be high by a numerical check of the accuracy of semi-classical relations among χ, $\sqrt{N}\chi$ and $N\chi$ derived by the WKB treatment. (13 refs.)

69929 Violations of Bell's inequality in cooperative states. P.D.Drummond (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).
Phys. Rev. Lett. (USA), vol.50, no.19, p.1407-10 (9 May 1983).
Cooperative multiparticle quantum states in an Einstein-Podolsky-Rosen type of experiment are shown to violate a Bell inequality. Thus correlations can occur between wave packets each having N bosons which cannot be explained within local hidden-variable theories. This provides a way to test quantum measurement theory for multiparticle states. In these states, a local, positive probability distribution exists for all N. However, the representation of correlations with this probability distribution is different from that in standard (Bell-type) hidden-variable theories. (12 refs.)

69930 Wigner-Kirkwood expansion of *N*-body Green's function: the case with magnetic field. E.Tirapegui (Faculte des Sci., Univ. Libre de Bruxelles, Brussels, Belgium), F.Langouche, D.Roekaerts.
Phys. Rev. A (USA), vol.27, no.5, p.2649-55 (May 1983).
A systematic method is given to compute the semiclassical Wigner-Kirkwood expansion of the off-diagonal thermal kernel of an N-body quantum system. (7 refs.)

69931 Comments about energies of parameter-dependent systems. F.M.Fernandez, E.A.Castro (INIFTA, La Plata, Argentina).
Phys. Rev. A (USA), vol.27, no.5, p.2735-7 (May 1983).
It is shown that the proper dependence of eigenvalues with respect to the parameters and quantum numbers can be found by calculating the extremum of the energy functional. (4 refs.)

69932 Universal unfolding of Hamiltonian systems: from symplectic structure to fiber bundles. F.Zaccaria (Istituto di Fisica Teorica, Univ. di Napoli, Napoli, Italy), E.C.G.Sudarshan, J.S.Nilsson, N.Mukunda, G.Marmo, A.P.Balachandran.
Phys. Rev. D (USA), vol.27, no.10, p.2327-40 (15 May 1983).
The problem of the global Lagrangian description of a dynamical system which has a global Hamiltonian description is considered; the motion of a charged particle in the field of a static magnetic monopole is a prototype of such dynamical problems. The symplectic structure on the (cotangent bundle of the) manifold is associated with a closed but not necessarily exact two-form. In conventional language this means that the tensor field inverse to the symplectic metric is divergence free but not necessarily expressible globally as the curl of a vector field; and hence the usual passage to Hamilton's principle and the Lagrangian can be carried out in patches but not necessarily globally. Generalizing techniques developed elsewhere, the authors show that the fundamental expression for the action integral is like the surface integral of the closed but not necessarily exact antisymmetric tensor field (two-form) rather than like the line integral of a vector field (one-form). This naturally leads to the path-space formalism in which the action functional depends not only on a point in configuration space but also a path from a chosen fixed point terminating in the relevant point in configuration space. They then show how this is a 'universal unfolding' and how the topological obstructions in the configuration-space description are circumvented in the path-space description. The path-space description contains redundancies and they can be reduced; locally the new manifold is obtained by associating an angle of rotation [a U(1) fiber] with each configuration-space point, but globally there would be a nontrivial fiber-bundle structure. These questions naturally carry over to the quantum theory of such systems and it is shown how quantization conditions arise. The structure of the quantum-theory formalism for such systems is analyzed. The considerations are applied to the monopole problem where the enlarged space in which the Lagrangian description is possible is explicitly identified as the manifold of the group SU(2). (8 refs.)

69933 Error estimates for piecewise perturbation series solutions of the radial Schrodinger equations. M.D.Smooke (Appl. Math. Div., Sandia Nat. Labs., Livermore, CA, USA).
SIAM J. Numer. Anal. (USA), vol.20, no.2, p.279-95 (April 1983).
When the coefficient matrix $P(r)$ of the radial Schrodinger equation is approximated by a matrix of piecewise polynomials, the equation can be rewritten in a form such that a piecewise perturbation series solution can be obtained. Error estimates are obtained for the error incurred by solving the radial Schrodinger equation in this manner. (26 refs.)

69934 Systems of equations of n-waves and nonlinear Schrodinger equations from the group-theoretical point of view. A.V.Zhiber (Ufa Aviation Inst., Ufa, USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.882-8 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.405-13 (Sept. 1982). [received: May 1983]
Studies a group-theoretical analysis of a system of equations of n-waves and a system of nonlinear Schrodinger equations. The Lie-Backlund algebras of these equations are fully described. These algebras are commutative, and there is a one-to-one correspondence between them and the commutative Lie algebras of the conservation laws. The connection between the Lie-Backlund algebras of the considered systems of equations is found. (7 refs.)

69935 Quasiclassical particle in a one-dimensional self-consistent field. S.I.Chernykh (Moscow Inst. of Electronic Engng., Moscow, USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.939-41 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.491-4 (Sept. 1982). [received: May 1983]
Langer's method (1956) is used to construct a quasiclassical series of eigenfunctions for a one-dimensional self-consistent field equation. (6 refs.)

69936 Explicit solution of the wave equation for a symmetric triple-well potential. R.S.Kaushal (Dept. of Phys., Univ. of Delhi, Delhi, India), H.O.Sharma.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.48
In the past few years, several approaches have been used to obtain fairly accurate eigenvalues for an anharmonic oscillator potential of the type bx^2+cx^4, which represents a double-well feature. Recently, Muller-Kirsten and Mansour and Muller-Kirsten have also obtained the eigenvalues and eigenfunctions for this potential using a perturbative procedure. The authors apply this method of Muller-Kirsten to a symmetric triple-well potential. In particular, they obtain the eigenvalues and eigenfunctions for a potential of the type $bx^2+cm^4+x^6$, in the form of analytic asymptotic expansions. Also, two pairs of solutions of the wave equation are obtained and their matching is considered in different regions.

(see also 11.20 S-matrix theory, and 11.80 Relativistic scattering)

69937 High energy scattering theory of many-particle system. Ruan Tu-nan (Univ. of Sci. & Technol. of China, China), Wang Wei-wei, Li Yang-guo, Zhang Yu-shun.
Commun. Theor. Phys. (China), vol.1, no.1, p.49-58 (1982).
Within the framework of the Glauber theory, the authors divide the many-particle system into two subsystems, formed by the 'Valence' particles and the 'Sea' particles respectively. Then the multiple scattering amplitudes can also be divided into 'sea'-'sea', 'sea'-'valence', 'valence'-'sea', and 'valence'-'valence' multiple scattering amplitudes. For the calculation of these different amplitudes, different effective approximate methods are proposed. Finally, the S matrix for the 'sea'-'sea', 'sea'-'valence', 'valence'-'sea' and 'valence'-'valence' processes is obtained. (3 refs.)

69938 Initial states of maximal entropy in formal scattering theory. P.Pfeifer, R.D.Levine (Fritz Haber Res. Center for Molecular Dynamics, Hebrew Univ., Jerusalem, Israel).
J. Chem. Phys. (USA), vol.78, no.8, p.4938-46 (15 April 1983).
For a precollision state which is not sharply defined, not all details of the dynamics can be obtained by examination of the final state. A version of formal collision theory which takes full advantage of the inherent loss of detail is provided. Only the relevant aspects of the dynamics need then be computed and an explicit identification of the relevant details is provided by a generalized intertwining theorem. Several explicit examples where this point of view can be implemented are worked out. (21 refs.)

69939 A stationary proof of Lavine's formula for time-delay. A.Jensen (Centre de Phys. Theorique, CNRS, Marseille, France).
Lett. Math. Phys. (Netherlands), vol.7, no.2, p.137-43 (March 1983).
Lavine's formula (1974) gives a connection between time-delay and potential in scattering theory. A proof is given for potentials $V=V_1+V_2$, $|V_1(x)|+|x.\nabla V_1(x)|\leq c(1+|x|)^{-1-\epsilon}$. $V_2(x)=O(|x|^{-2-\epsilon})$ as $|x|\rightarrow\infty$, using the stationary method. A new stationary representation for the time-delay operator is found. (9 refs.)

04.20 GENERAL RELATIVITY

(see also 02.40 Geometry and topology)

69940 Natural coordinates for an accelerated observer. P.Mitra (Barasat Government Coll., Barasat, West Bengal, India), S.Datta Majumdar.
Fizika (Yugoslavia), vol.15, no.1, p.93-113 (Jan.-March 1983).
The line element for an accelerated observer is derived by assuming linearity of transformation between his coordinates for any given time and a system of Galilean coordinates. It is noted that any 4×4 orthogonal matrix $[a]$ with a_{i4}, a_{4i} imaginary, a_{44} and other elements real represents a possible transformation from an inertial to an accelerated frame. Examples of such matrices are given and the associated angular velocities calculated. Finally, by a suitable interpretation of the Eulerian matrix giving the orientation of a rigid body in space the matrix representing the general motion of a frame on an inertial plane is obtained. (8 refs.)

69941 Surface integrals and the gravitational action. J.M.Charap, J.E.Nelson (Dept. of Phys., Queen Mary Coll., London, England).
J. Phys. A (GB), vol.16, no.8, p.1661-8 (1 June 1983).
The authors discuss the modifications needed to free the Einstein-Hilbert action of gravitation from all second derivatives of fields, and give explicitly the resulting action applicable to either metric or vierbein variables. Variation of this action leads to Einstein's equations without boundary conditions. It vanishes for flat space-time and contains one arbitrary real parameter. (16 refs.)

69942 Rotating fluid spheres. B.W.Stewart (Dept. of Phys., Thomas More Coll., Ft. Mitchell, KY, USA).
J. Phys. A (GB), vol.16, no.8, p.1689-93 (1 June 1983).
A new exact solution to the 'slow rotation' structure equations is presented. It is briefly compared with the slowly rotating limit of the Wahlquist solution, with which the new solution shares an equation of state. (7 refs.)

69943 On the Kramer-Neugebauer spinning masses solutions. M.Yamazaki (Dept. of Phys., Kanazawa Univ., Kanazawa, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.503-15 (Feb. 1983).
It is shown that the three metric functions f, ω and γ of collinear N Kerr particles ($N=1, 2, 3, \ldots$) are written, in terms of six determinants of degree N (J, K, L, M, S and T), in a concise closed form. The conditions both for the regularity of the metric on the symmetrical z axis and for the positive total mass are discussed. The two hitherto unnoticed potentials L and M are introduced in order to evaluate the metric function ω. (7 refs.)

69944 Generalized constraint structure for gravitation theory. A.Komar (Physics Div., Nat. Sci. Found., Washington, DC, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2277-81 (15 May 1983).
By exploiting the conformal symmetry inherent in the Einstein theory the author constructs a more general form for the Dirac constraints involving an arbitrary function. This more general form is required if a canonically quantized theory is to accommodate renormalization. (7 refs.)

69945 Bianchi type-I models with conformally invariant scalar field. A.J.Accioly, A.N.Vaidya, M.M.Som (Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil).
Phys. Rev. D (USA), vol.27, no.10, p.2282-4 (15 May 1983).
The solutions of the Einstein equations with the trace-free energy-momentum tensor of conformally invariant scalar field as source are obtained in a spatially homogeneous anisotropic space-time. Some interesting features of the solutions are discussed. (6 refs.)

69946 Elastic scattering in the Zipoy-Voorhees metric. J.P.Krisch (Dept. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2305-9 (15 May 1983).
The elastic scattering of test particles from an oblate static source is examined. The elastic cross section for scatterings in the equatorial plane is calculated and compared to the Schwarzschild cross section. Equations determining the critical angular momentum as a function of energy and oblateness are derived. (5 refs.)

69947 Absolute nature of the thermal ambience of accelerated observers. U.H.Gerlach (Center for Theoretical Phys., Univ. of Texas, Austin, TX, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2310-15 (15 May 1983).
The blackbody radiation (thermal ambience) surrounding a linearly and uniformly accelerated observer is shown to be totally isotropic. By contrast, an observer who does not merely have this uniform acceleration into some direction, but also (a) drifts uniformly (according to his own clock) into another, or alternatively (b) orbits uniformly around a fixed axis, will be surrounded by vacuum fluctuations with the spectrum of a blackbody endowed with a chemical potential. This potential is proportional to the drift velocity for one observer, and to the angular velocity for the other. These chemical potentials express an anisotropy of empty flat space relative to these observers. (14 refs.)

69948 Gauss-Tolman theorem and positivity of the total mass-energy for a nonstatic sphere in the general theory of relativity. V.A.Ruban (B.P. Konstantinov Leningrad Inst. of Nuclear Phys., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.2, p.249-57 (Aug. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.2, p.460-74 (Aug. 1982). [received: May 1983]
A generalization is given of Tolman's potential form of the integral of the total mass-energy for nonstatic, centrally symmetric matter distributions in R regions of V_4. A local conservation law for the total energy of the gravitational field and matter in general relativity is discussed on the basis of the quasi-Newtonian Gauss-Tolman theorem. It is shown that the Schwarzschild mass, the equivalent of the total energy, is positive in the presence of T regions in 'semiclosed' models of a sphere, and thus the gravitational mass defect cannot exceed the total self-energy of the matter. (20 refs.)

04.40 CONTINUOUS MEDIA; ELECTROMAGNETIC AND OTHER MIXED GRAVITATIONAL SYSTEMS

69950 Entropy bounds and the second law for black holes. J.D.Bekenstein (Phys. Dept., Ben Gurion Univ., Beer Sheva, Israel).
Phys. Rev. D (USA), vol.27, no.10, p.2262-70 (15 May 1983).
A counterexample to the entropy bound proposed by Unruh and Wald (1982) and by Page (1982) is described. The bound states that the entropy S of any system with energy E and volume V cannot exceed the entropy of an equal volume and energy of unconfined thermal radiation. The bound is found to be violated by thermal field systems whose various dimensions differ by an order of magnitude or more, the violation occurring at intermediate energies. Unruh and Wald used the bound in an argument establishing the validity of the generalized second law when a box containing some entropy is lowered to near a black hole, then opened, and withdrawn open. If the box is thin in one direction, the failure of the bound for its contents makes it appear that a violation of the second law is possible. The author shows that, in fact, for a thin box the buoyancy effects on which Unruh and Wald's argument relies cancel out. As a result, the second law is fulfilled despite the failure of the bound. It appears from the second law that the bound must nevertheless hold when applied to box plus contents, but a direct proof of this is still lacking. The author also considers the alternative entropy bound $S \leq 2\pi ER/\hbar c$($2R$ is the largest dimension of the system) proposed earlier. For field systems it is shown to fail at very low energies, but to be valid for complete systems (i.e., box plus confined fields). Further, the author shows $S \leq 2\pi ER/\hbar c$ is a necessary condition for fulfillment of the second law when a thin system is dropped into a black hole (even in the face of buoyancy) in the sense that if the bound failed, the law would be violated. (16 refs.)

69951 Entropy bounds, acceleration radiation, and the generalized second law. W.G.Unruh (Dept. of Phys., Univ. of British Columbia, Vancouver, British Columbia, Canada), R.M.Wald.
Phys. Rev. D (USA), vol.27, no.10, p.2271-6 (15 May 1983).
The authors calculate the net change in generalized entropy occurring when one attempts to empty the contents of a thin box into a black hole in the manner proposed recently by Bekenstein (1983). The case of a 'thick' box also is treated. It is shown that, as in the previous analysis (1982), the effects of acceleration radiation prevent a violation of the generalized second law of thermodynamics. Thus, in this example, the validity of the generalized second law is shown to rest only on the validity of the ordinary second law and the existence of acceleration radiation. No additional assumptions concerning entropy bounds on the contents of the box need to be made. (7 refs.)

04.50 UNIFIED FIELD THEORIES AND OTHER THEORIES OF GRAVITATION

69952 Conservation laws and string-like matter distributions. A.Jadczyk (Inst. fur Theoretische Phys., Univ. Gottingen, Gottingen, Germany).
Ann. Inst. Henri Poincare Sect. A (France), vol,38, no.2, p.99-111 (1983).
Equations of motion for singular distributions of matter, like point particles, strings, membranes and bags are derived by Souriau method. Interactions with metric tensor, non-Abelian gauge fields and G-structures are taken into account. Particles carrying spinorial charges in super-gravity field are also examined. (15 refs.)

69953 A relationship between the electrovacuum Ernst equations and nonlinear σ-model. P.O.Mazur (Inst. of Phys., Jagellonian Univ., Cracow, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.4, p.219-39 (April 1983).
The Ernst equations for the stationary Einstein-Maxwell fields are shown to be connected with the field theory of harmonic map from the Riemann three-space (M, h_{ik}) into a Kahler symmetric space $SU(2,1)/SU(2)\times U(1)$ i.e. the non-linear σ-model on symmetric space of the covariance group of these equations; similarly, the vacuum Ernst equations can be interpreted as the σ-model on $SU(1,1)/U(1)$. The formulation of Ernst's equations in terms of $SU(2,1)$-valued field subject to a quadratic constraint, which realizes an embedding of a Kahler symmetric space into the covariance group is given. For the axially symmetric fields it is shown that Ernst's equations are integrable. The Zakharov-Shabat null-curvature representation of these equations and the corresponding linear system of equations is presented. It is conjectured that an infinite-dimensional group of transformations acting on the solution space of the Ernst equations, which appears naturally in this approach, is connected with the Geroch-Kinnersley group. (39 refs.)

69954 The nonsymmetric-nonabelian Kaluza-Klein theory. M.W.Kalinowski (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
J. Phys. A (GB), vol.16, no.8, p.1669-88 (1 June 1983).
The author considers an $(n+4)$-dimensional unification of Moffat's theory of gravitation and Yang-Mills field theory with nonabelian gauge group G. The author found 'interference effects' between gravitational and Yang-Mills (gauge) fields which appear to be due to the skewsymmetric part of the metric of Moffat's theory and the skewsymmetric part of the metric on the group G. The unification, called the nonsymmetric-nonabelian Kaluza-Klein theory, becomes classical Kaluza-Klein theory if the skewsymmetric parts of both metrics are zero. (23 refs.)

69955 Space-time symmetries and the gravitational-neutrino field equations in general relativity. C.A.Kolassis (Lab. de Phys. Theorique, Inst. Henri Poincare, Paris, France).
Phys. Lett. A (Netherlands), vol.95A, no.2, p.82-4 (18 April 1983).
Considers a neutrino field with geodesic rays in interaction with a gravitational field admitting a Killing vector field n^{μ}. It is found that for solutions of the Einstein-Weyl field equations the neutrino field ξ^{A} and the neutrino flux vector l^{μ} are restricted by the equations: $L_n\xi^{A}=-{}^1/_2 is\xi^{A}$ and $L_n l^{\mu}=0$, where s is a real constant. In the case of pure radiation neutrino fields these equations become: $L_n\xi^{A}={}^1/_2(p-is)\xi^{A}$, $L_n l^{\mu}=pl^{\mu}$, where p and s are in geneal real functions of the coordinates. (3 refs.)

69956 Spontaneous symmetry breaking in Kaluza-Klein theories. A.Karlhede, T.Tomaras (California Inst. of Technol., Pasadena, CA, USA).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.49-53 (19 May 1983).
The authors study the bosonic spectrum of Kaluza-Klein theories by considering the symmetries of the vacuum. They find that the introduction of external gauge fields with non-vanishing vacuum expectation values affects the massless vectors and may break isometries of the internal space making the corresponding gauge vectors massive. (9 refs.)

69957 Gauge theory of gravity. H.R.Pagels (Rockefeller Univ., New York, NY, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2299-304 (15 May 1983).
The author develops an O(5) gauge theory in which the 0(5) symmetry is spontaneously broken to 0(4) with a scale on the order of the Planck mass. The ten components of the 0(5) gauge field are identified as the four vierbeins and six connections of Euclidean general relativity. In the strong-coupled limit the effective action is dominated by a dimension-five operator induced by the anomalous fermion triangle loop which turns out to be the usual Hilbert action. The metric is not a dynamical field in this model and its equation of constraint is just the usual metric-vierbein relation. The author suggests $SU(9) \supset SU(5) \times 0(5)$ as the simplest group for a totally unified theory. (14 refs.)

69958 Unification of generalized electromagnetic and gravitational fields. B.S.Rajput (Dept. of Phys., Kumaun Univ., Naini Tal, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.53
Postulating the Heavisidian monopole and keeping in mind the recent interest in the linear equations for gravitational field, the structural symmetry between the generalized gravitational field and the generalized electromagnetic field (associated with dyons) has been demonstrated and the field equations, equations of motion and the quantization conditions for angular momentum which operates for both these fields have been unified in a consistent symmetrical manner. It has also been shown that Heavisidian monopoles are the most strongly interacting form of matter.

04.60 QUANTUM THEORY OF GRAVITATION

69959 Space-time foam, induced by one-loop quantum-gravitational corrections. L.A.Kofman (Inst. of Astrophys. & Atmospheric Phys., Acad. of Sci., Tartu, Estonian SSR).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.165-7 (28 April 1983).
Space-time may have large fluctuations of geometry on short-length scales, which are induced by one-loop quantum-gravitational corrections. Some instanton-like self-consistent solutions have been found, which describe these space-time fluctuations. (9 refs.)

69960 Linear conformal quantum gravity. B.Binegar, C.Fronsdal, W.Heidenreich (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2249-61 (15 May 1983).
This paper is an investigation of field theories that satisfy the following two criteria: (1) Among the propagation modes is a pair of massless particles with helicities ±2. (2) The canonical commutation relations are conformally invariant. This study of 'linear conformal gravity' is motivated by the belief that conformal invariance may be the key to a future theory of quantum gravity. The first conclusion is that the fields of linear conformal gravity include a tensor field of rank 3 and mixed symmetry, and a symmetric tensor field of rank 2, tentatively interpreted as a torsion field and a metric field. The free quantum field operator is constructed explicitly, and the propagator is calculated. The Fourier transform is of dimension p^{-4}, which is encouraging for renormalizability. The field inevitably carries along a nonunitary ghost, similar to the one that turns up in linearized Weyl gravity. The main result is that the ghost can be exorcised by imposing constraints on the external sources and boundary conditions on the physical states. (13 refs.)

04.65 SUPERGRAVITY

69961 Supergravity generates hierarchies. H.P.Nilles (CERN, Geneva, Switzerland).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.366-80 (23 May 1983).
It is argued that local supersymmetry might provide us with a solution to the hierarchy problem. The Planck mass, the grand unification scale and the scale of weak interaction breakdown might be understood in terms of each other. The general mechanism is outlined and the resulting low-energy sector is discussed. It is pointed out that there are several inequivalent ways to fine tune the cosmological constant. (35 refs.)

69962 Petrov classification of supergravity. C.Pilot (Max-Planck-Inst. fur Phys. und Astrophys., Werner Heisenberg Inst. fur Phys., Munich, Germany).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.465-88 (23 May 1983).
$N=1$ supergravity is analyzed in light of the Petrov classification scheme. It is found that the $(2, {}^3/_2)$ chiral multiplet obtained must be recognized as the Weyl submultiplet, W_{abc}, where only $({}^3/_2, 0)+(0, {}^3/_2)$ components contribute. Due to the SUSY transformation laws the classes of solutions allowed for various Petrov types are shown to be restrictive—indeed, in certain instances there can be no consistent solution. The freedom left in the solutions and their possible interpretation are discussed. One-loop invariants are also considered by resorting to noncovariant forms. (13 refs.)

69963 Conformal supergravity in ten dimensions. E.Bergshoeff (Inst.-Lorentz, Leiden, Netherlands), M.de Roo, B.de Wit.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.489-530 (23 May 1983).
The authors present the complete off-shell structure of conformal supergravity in ten dimensions. It is based on 128+128 degrees of freedom and its formulation requires differential constraints. They study how these constraints are resolved in four and five dimensions. Covariant conditions are given that restrict conformal supergravity to its on-shell Poincare counterpart. In ten dimensions the relationship between the two theories has new and unusual aspects, which are explored in a variety of ways. The authors rewrite on-shell Poincare supergravity in a superconformally invariant form, from which they deduce that its off-shell version must contain at least a scalar (chiral) multiplet. They analyze some aspects of the nonlinear structure of the field representation based on the conformal fields combined with one scalar multiplet. (19 refs.)

69964 Constraints on the stability of mass hierarchies in supergravity. H.P.Nilles, M.Srednicki, D.Wyler (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.337-40 (5 May 1983).
The authors study supersymmetric grand unified models coupled to $N=1$ supergravity with a gauge hierarchy induced by the breakdown of local supersymmetry, and a low energy scale given by the gravitino mass. Certain conditions must be fulfilled for this hierarchy to remain stable in perturbation theory. They discuss these constraints and show that most presently available models do not have a stable hierarchy. (13 refs.)

69965 Vacuum energy in gauged extended supergravity. B.Allen, S.Davis (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.353-6 (5 May 1983).
The one loop vacuum energy in gauged extended supergravity is calculated in anti de Sitter space using zeta function regularisation. It vanishes for $N \geq 5$. The energy zeta function has no poles for $N \geq 3$. (11 refs.)

69966 Ten into four won't go. D.Z.Freedman, G.W.Gibbons, P.C.West (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.491-2 (12 May 1983).
It is shown that nontrivial spontaneous compactification of ten-dimensional $N=1$ supergravity with or without Yang Mills matter is not possible unless maximal symmetry (i.e. Lorentz invariance) is violated in the four-dimensional spacetime. (9 refs.)

69967 Gauged seven-dimensional supergravity. P.K.Townsend (Lab. de Phys. Theorique, Ecole Normale Superieure, Paris, France), P.van Nieuwenhuizen.
Phys. Lett. B (Netherlands), vol.125B, no.1, p.41-6 (19 May 1983).
The authors construct Yang-Mills theory and simple supergravity in seven dimensions. They gauge the rigid SU(2) symmetry of the latter. The potential for the scalar field ϕ is of the form $\exp(\phi)$ and has no extremum. Possible improvement due to a 'topological mass term' is discussed. (13 refs.)

69968 Supergravity as the messenger of supersymmetry breaking. L.Hall (Dept. of Phys., Univ. of California, Berkeley, CA, USA), J.Lykken, S.Weinberg.
Phys. Rev. D (USA), vol.27, no.10, p.2359-78 (15 May 1983).
A systematic study is made of theories in which supergravity is spontaneously broken in a 'hidden' sector of superfields that interact with ordinary matter only through supergravity. General rules are given for calculating the low-energy effective potential in such theories. This potential is given as the sum of ordinary supersymmetric terms involving a low-energy effective superpotential whose mass terms arise from integrating out the heavy particles associated with grand unification, plus supersymmetry-breaking terms that depend on the details of the hidden sector and the Kahler potential only through the values of four small complex mass parameters. The result is not the same as would be obtained by ignoring grand unification and inserting small mass parameters into the superpotential from the beginning. The general results are applied to a class of models with a pair of Higgs doublets. (23 refs.)

69969 Integration over surfaces in superspace. A.V.Gaiduk, O.M.Khudaverdyan, A.S.Shvarts (Moscow Engng. Phys. Inst., Moscow, USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.862-8 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.375-83 (Sept. 1982). [received: May 1983]
A study is made of (m,n)-densities, which are the most general entities that can be integrated over a (m,n)-dimensional surface in superspace. It is shown that the Bernshtein-Leites integral forms can be interpreted as densities; the class of densities corresponding to these forms is characterized. (6 refs.)

04.80 EXPERIMENTAL TESTS OF GENERAL RELATIVITY AND OBSERVATIONS OF GRAVITATIONAL RADIATION

69970 Review of resonant bar gravity wave experiments. W.C.Oelfke (Louisiana State Univ., Baton Rouge, LA, USA).
AIP Conf. Proc. (USA), no.96, p.331-5 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
A review is given of the experimental efforts since 1958 to detect gravitational waves using Weber-type resonant bar antennas. Special attention is paid to the continued funding of and collaboration between research groups and the importance of this kind of support in experimental searches for rare events. Evidence for an atmosphere of mutual support between gravitational wave groups on an international level is seen in the rapid progress toward greater antenna sensitivity and improved measurement techniques. (22 refs.)

69971 Laser interferometer gravitational radiation detectors. R.W.P.Drever (California Inst. of Technol., Pasadena, CA, USA).
AIP Conf. Proc. (USA), no.96, p.336-46 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
Some techniques proposed or currently under development for detection of gravitational radiation by laser interferometers are reviewed, with particular emphasis on experiments covering the lower frequencies potentially accessible to ground based instruments. (12 refs.)

69972 Prospects for ground based detectors of low frequency gravitational radiation. R.Spero (California Inst. of Technol., Pasadena, CA, USA).
AIP Conf. Proc. (USA), no.96, p.347-50 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
Substantial effort will be required to minimize seismic and thermal noise in low frequency (below 100 Hz) gravitational wave detectors. The ultimate

limit to the sensitivity of earthbound detectors is time-varying gravitational gradients due to atmospheric activity; a practical lowest frequency for sensitive operation may be about 0.1 Hz. (7 refs.)

69973 High-energy gravitational antennas: a theoretical approach. F.de Felice (Istituto di Fisica Univ. di Padova, Padova, Italy), R.Turolla.
Nuovo Cimento C (Italy), vol.5C, ser.1, no.5, p.507-14 (Sept.-Oct. 1982). [received: May 1983]
Devices exploiting nuclear resonances are believed to be very promising in detecting weak gravitational-wave perturbations. The main difficulty with these systems is that the high-energy photons which induce the nuclear transitions need to travel over distances comparable with the gravitational wave wave-lengths (~100 km). It is shown that if these high-energy photons are not produced by nuclear de-excitation but by inverse Compton scattering of laser light with ultra relativistic electrons, a deviation from the resonant frequencies of the order of the gravitational wave amplitude is still attained without the photon travel time being comparable with the gravitational-wave periods. (12 refs.)

69974 Deterministic model of spin and statistics. I.Pitowsky (Dept. of Philosophy, Univ. of Western Ontario, London, Ontario, Canada).
Phys. Rev. D (USA), vol.27, no.10, p.2316-26 (15 May 1983).
A deterministic model that accounts for the statistical behavior of random samples of identical particles is presented. The model is based on some nonmeasurable distribution of spin values in all directions. The mathematical existence of such distributions is proved by set-theoretical techniques, and the relation between these distributions and observed frequencies is explored within an appropriate extension of probability theory. The relation between quantum mechanics and the model is specified. The model is shown to be consistent with known polarization phenomena and the existence of macroscopic magnetism. Finally the possibility of a thought experiment which indicates a deviation from the predictions of quantum mechanics is described. (11 refs.)

69975 Energy inequalities $\binom{N}{2}^{-1}E_N<\binom{K}{2}^{-1}E_K$, $2<K<N$, relating two systems of identical bosons. R.L.Hall (Dept. of Math., Concordia Univ., Montreal, Quebec, Canada).
Phys. Rev. D (USA), vol.27, no.10, p.2379-82 (15 May 1983).
Suppose E_N is the lowest energy of a translation-invariant system of N identical bosons which interact by attractive central pair potentials and obey nonrelativistic quantum mechanics. Sufficient conditions are prescribed on the potential to prove that E_N is bounded above by $\binom{N}{2}\binom{K}{2}^{-1}E_K$, where $N\geq\mu K$. The μ numbers are specified for various classes of potential shape. In cases where $\mu\leq{}^3/_2$, it follows that $E_N\leq{}^1/_2N(N\text{-}1)E_2$ for $N\geq3$. (7 refs.)

69976 A new integral equation for Fermi systems—the superposition approximation and its extension to calculation of the two-body correlation function. Li Tiecheng (Inst. of Phys., Acad. Sinica, Beijing, China), Lin Peiwen.
Sci. Sin. (China), vol.26, no.4, p.402-11 (April 1983).
A new integral equation for the two-body correlation function is derived for Fermi systems in the framework of correlated basis-function. The exchange characteristics of fermions are considered in detail according to the topological structure at the vertices of correlation bonds. The only approximation used is the Kirkwood superposition approximation and its extension. Since decomposition into various exchange parts is known, the three forms of the kinetic energy test can be obtained in this new Chakravarty-Woo formalism (1978). (12 refs.)

69977 General Hartree-Fock solutions for a one dimensional δ-function gas. B.Sykja, J.-L.Calais (Quantum Chem. Group, Univ. of Uppsala, Uppsala, Sweden).
Theor. Chim. Acta (Germany), vol.62, no.5, p.429-42 (1983).
The one dimensional fermion gas with δ-function interactions is studied within the General Hartree-Fock (GHF) framework. Solutions of the eight Fukutome types are constructed by pairing and the corresponding gap equations are solved. The character of the solutions is studied as a function of the particle density. 05.40 FLUCTUATION PHENOMENA, RANDOM PROCESSES, AND BROWNIAN MOTION

69978 Optimal parameter identification for a linear system excited by Gaussian noise. F.Brodeau (Lab. IMAG, Univ. de Grenoble II, Grenoble, France).
Ann. Inst. Henri Poincare Sect. B (France), vol.19, no.2, p.123-52 (1983). In French.
This paper is concerned with the problem of parameter estimation in a system modelled by a scalar linear stochastic differential equation excited by Gaussian noise when controls of feedback type are used. Parameters in the noise being known, it is shown, for two controls, a step one, and a markovian one, that the drift parameters are identifiable by a family of maximum likehood estimates which is consistent and asymptotically normally distributed. For that aim existence of stationary solutions of the differential equation is proved. Further it is shown that each control is optimal for large classes of controls with respect to a criterion based on the information matrix. (11 refs.)

69979 Local nondeterminism and local times of general stochastic processes. S.M.Berman (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA).
Ann. Inst. Henri Poincare Sect. B (France), vol.19, no.2, p.189-207 (1983).
Let $X(t)$, $0\leq t\leq1$, be a real stochastic process, and let $g(t)$, $0\leq t\leq1$, be a nonnegative integrable function. $X(t)$ is said to be locally g-nondeterministic if for every $k\geq2$, there exists $c_k>0$ such that the joint density of the $k-1$ increments, $X(t_{j+1})-X(t_j)$, $j=1, \ldots, k-1$, $t_1<\ldots<t_k$, evaluated at the origin, is bounded above by $c_kg(t_2-t_1)\ldots g(t_k-t_{k-1})$. This condition implies the validity of key estimates in the analysis of the local time of the process. The latter imply specific irregularity properties of the sample functions. Such properties have been studied for several years in the context of Gaussian processes. The contribution of this work is the demonstration that local nondeterminism can be usefully defined even for processes that are not necessarily Gaussian, and that the comprehensive theory of sample function irregularity for the latter processes can be extended to more general processes. Applications to Markov processes are exhibited. (20 refs.)

69980 Markov properties of $\mathbf{R}^2$ processes. M.Dozzi (Dept. de Statistique Math., Univ. de Berne, Berne, Switzerland).
Ann. Inst. Henri Poincare Sect. B (France), vol.19, no.2, p.209-21 (1983). In French.
Markov properties of stochastic processes (X_z; $z\epsilon\mathbf{R}^2$ (or $z\epsilon\mathbf{Z}^2$)) are considered. Emphasis is on two-parameter analogies of the following local Markov property: (Y_t; $t_0<t<t_1$) is conditionally independent of (Y_t; $t<t_0$ or $t>t_1$) given (Y_{t0}, Y_{t1}) for processes (Y_t; $t\epsilon\mathbf{R}$). In particular, the stationary Gaussian processes X, satisfying a local Markov property, are characterized. (10 refs.)

69981 Statistical physics: some basic principles of fluctuation and noise theory. N.Pacilio, M.Ciofalo (Dipartimento Reattori Veloci, Univ. degli Studi, Roma, Italy), M.Cirillo, R.Conversano, L.Magri, C.Napolitano, C.Trozzi, R.Vaccaro, V.Violante.
Ann. Nucl. Energy (GB), vol.10, no.6, p.305-17 (1983).
The authors propose a method for setting the fundamentals of fluctuation and noise theory in the framework of statistical mechanics; the emphasis is on describing the structural characteristics of some mathematical models of a stochastic nature. (16 refs.)

69982 Singular perturbation expansion for Markovian master equations. Ding E Jiang (Dept. of Phys., Liaoning Univ., China).
Commun. Theor. Phys. (China), vol.1, no.1, p.37-48 (1982).
Asymptotic properties of the master equations for chemical reactive systems whose macroscopic rate equations have more than one stationary state are discussed using generating function method. The systematic singular perturbation expansion method for equation of generating function is generalized to include the case of multistationary system beyond the bifurcation point. (13 refs.)

69983 Hierarchy of chaotic bands and periodicities embedded in them in a forced nonlinear oscillator. Hao Bai-lin, Zhang Shu-yu (Faculte des Sci., Univ. Libre de Bruxelles, Bruxelles, Belgium).
Commun. Theor. Phys. (China), vol.1, no.1, p.111-15 (1982).
Secondary direct and inverse bifurcation sequences exist in the chaotic bands of the primary inverse sequence. In the secondary chaotic bands periodicities of the tertiary sequences appear. This has been shown numerically in the forced Brusselator. (10 refs.)

69984 The rate of absorption of Brownian particles by a sphere. S.Harris (Coll. of Engng. & Appl. Sci., State Univ. of New York, Stony Brook, NY, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4698-700 (1 April 1983).
The author considers the solution of the Fokker-Planck equation for the case where a uniform dilute system of Brownian particles filling the volume $r>R$ is absorbed at the boundary $r=R$ for times $t>0$. An approximate solution is obtained for this time-dependent problem by using the lowest order terms in a half-range moment expansion of the Brownian particle distribution function. The solution obtained is used to examine the validity of Fick's law and to find the rate coefficient for the absorption process. This latter result is compared with the result found using the diffusion equation solution together with Fick's law. The author finds that the rate coefficient can be substantially smaller than the result predicted by the diffusion equation; this conclusion is a general agreement with earlier results for a related steady-state problem. (7 refs.)

69985 Voronoi cell properties from simulated and real random spheres and points. H.G.Hanson (Dept. of Phys., Univ. of Minnesota, Duluth, MN, USA).
J. Stat. Phys. (USA), vol.30, no.3, p.591-605 (March 1983).
Results are reported of a computer-aided study of the properties of Voronoi cells generated from randomly placed impenetrable uniform spheres which saturate a space and of Poisson points in three-dimensional space. An empirical expression is suggested for the volume distribution function and an expression for the probability of the nth nearest neighbor of a Voronoi cell nucleus forming a cell face. Comparison is made with the work of Meijering (1953), Finney (1970), Kiang (1966), and others. Radial distributions, coordination number, and packing density are discussed for the spheres. (37 refs.)

69986 On the linearization of nonlinear Langevin-type stochastic differential equations. M.C.Valsakumar, K.P.N.Murthy, G.Ananthakrishna (Reactor Res. Centre, Kalpakkam, India).
J. Stat. Phys. (USA), vol.30, no.3, p.617-31 (March 1983).
The authors show that a logical extension of the piecewise optimal linearization procedure leads to the Gaussian decoupling scheme, where no iteration is required. The scheme is equivalent to solving a few coupled equations. The method is applied to models which represent (a) a single steady state, (b) passage from an initial unstable state to a final preferred stable state by virtue of a finite displacement from the unstable state, and (c) a bivariate case of passage from an unstable state to a final stable state. The results are shown to be in very good agremeent with the Monte Carlo calculations carried out for these cases. The method should be of much value in multidimensional cases. (13 refs.)

69987 Approximate Gaussian representation of evolution equations. I. Single degree of freedom nonlinear equations. B.J.West (Center for Studies of Nonlinear Dynamics, La Jolla Inst., La Jolla, CA, USA), G.Rovner, K.Lindenberg.
J. Stat. Phys. (USA), vol.30, no.3, p.633-48 (March 1983).
The authors have developed a generalization of the method of statistical linearization to enable us to describe transient and other nonstationary phenomena obeying stochastic nonlinear differential equations. This approximation technique provides an optimal Gaussian representation with time-

dependent parameters. The algorithm specifies a set of ordinary differential equations for the Gaussian parameters in terms of the time-dependent average nonlinearities. They apply the general formalism developed herein for single degree of freedom dissipative systems to a particular example. (24 refs.)

69988 Analytic study of power spectra of the tent maps near band-splitting transitions. H.Shigematsu, H.Mori, T.Yoshida, H.Okamoto (Dept. of Phys., Kyushu Univ., Fukuoka, Japan).
J. Stat. Phys. (USA), vol.30, no.3, p.649-79 (March 1983).
Successive band-splitting transitions occur in the one-dimensional map $x_{i+1}=g(x_i)$, $i=0, 1, 2,...$ with $g(x)=\alpha x$, $(0\leq x\leq 1/2)-\alpha x+\alpha$, $(1/2<x\leq 1)$ as the parameter α is changed from 2 to 1. The transition point from $N(=2^n)$ bands to $2N$ bands is given by $\alpha=(\sqrt{2})^{1/N}$ $(n=0, 1, 2,...)$. The time-correlation function $\xi_i\equiv\langle\delta x_i\delta x_0\rangle/\langle(\delta x_0)^2\rangle$, $\delta x_i\equiv x_i-\langle x_i\rangle$ is studied in terms of the eigenvalues and eigenfunctions of the Frobenius-Perron operator of the map. The asymptotic expression for ξ_i has been obtained by deriving an analytic form of ξ_i for a sequence of α which accumulates to $\sqrt{2}$ from the above. Near the transition point $\alpha=(\sqrt{2})^{1/N}$, the damping constant of ξ_i for $i\geq N$ is given by $\gamma_N=\sqrt{2}(\alpha^N-\sqrt{2})/N$. Numerical calculation is also carried out for arbitrary α and is shown to be consistent with the analytic results. (32 refs.)

69989 Statistical mechanics and population biology. L.Demetrius (Max-Planck-Inst. fur Biophys. Chem., Gottingen, Germany).
J. Stat. Phys. (USA), vol.30, no.3, p.709-53 (March 1983).
The paper exploits the connection between statistical mechanics and stochastic processes in order to derive a class of macroscopic observables for populations. The review treats the dynamics of populations in both constant and variable environments and derives in each case the thermodynamic analogs of the population parameters. (30 refs.)

69990 Phase transition in a four-dimensional random walk with application to medical statistics. O.E.Percus (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA), J.K.Percus.
J. Stat. Phys. (USA), vol.30, no.3, p.755-83 (March 1983).
A random walk in a piecewise homogeneous medium can exhibit a variety of asymptotic behaviors. In particular, it may lodge strictly in one region or divide in probability among several. This will depend upon the parameters describing (a) the walk, (b) the interregion boundary, and (c) the initial location of the walk. The authors analyze from this point of view a special four-dimensional walk on an integer lattice with two homogeneous regions separated by a hyperplane of codimension 1. The walk represents a continuing sequence of clinical trials of two drugs of unknown success probabilities and the two regions represent the Bayes-derived criterion as to which drug to try next. The demarcation in the parameter space of success probabilities and initial coordinates between one- and two-region asymptotics is mapped out analytically in several special cases and supporting numerical evidence given in the general case. (11 refs.)

69991 A method of approximation of invariant measures for maps on the unit interval. D.P.K.Ghikas (Dept. of Theoretical Phys., Univ. of Patras, Patras, Greece).
Lett. Math. Phys. (Netherlands), vol.7, no.2, p.91-8 (March 1983).
A method is proposed for the construction of continuous functions approximating the density functions for invariant measures of a map on the unit interval. (15 refs.)

69992 Markov process and entropy associated to a reversible evolution. S.Martinez (Dept. de Matematicas, Univ. de Chile, Santiago, Chile), E.Tirapegui.
Phys. Lett. A (Netherlands), vol.95A, no.3-4, p.143-5 (25 April 1983).
The Markov process associated to a reversible evolution in recent works of the Brussels group is characterized. The evolution and entropy of states concentrated on stable and unstable manifolds is considered. (9 refs.)

69993 On the lifetime of a metastable state at low noise. B.J.Matkowsky, Z.Schuss (Dept. of Engng. Sci. & Appl. Math., Northwestern Univ., Evanston, IL, USA).
Phys. Lett. A (Netherlands), vol.95A, no.5, p.213-15 (2 May 1983).
The mean lifetime of a metastable state of a dynamical system driven by small noise is calculated. The vector field of the dynamical system which need not be deriveable from a potential, is assumed to have a vanishing normal component on the boundary of the domain of attraction of the metastable state. (16 refs.)

69994 Similarity structure and scaling property of the period-adding phenomena. K.Kaneko (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.403-14 (Feb. 1983).
Period-adding sequence at the locking from torus to chaos is studied with the use of a one-dimensional mapping. Similarity and various scaling properties of each cycle are found numerically, which can be explained through a 'phenomenological theory' based on the existence of the fixed point function. The author classifies the sequence into three cases. The author also applies the theory to the case in which the sequence is a window among chaotic states. (19 refs.)

69995 Remarks on existence of noise-induced long-time tail. Y.Hamada (Inst. of Statistical Math., Tokyo, Japan), K.Muto.
Prog. Theor. Phys. (Japan), vol.69, no.2, p.451-63 (Feb. 1983).
Existence of noise-induced long-time tail (critical slowing down) is studied. Exact analytic solution of the stochastic differential equation $DX_t=(\gamma X_t-X_t^n)dt+X_t\circ dW_t$, where W_t is the Wiener process, is confirmed by solving the hierarchy equations of moments $\langle X_t^p\rangle$. A simple derivation procedure gives the same results as those obtained by Suzuki et al. (1982) and Brenig and Banai (1982). A transition probability density function corresponding to the stochastic differential equation is also derived. The moments $\langle X_t^p\rangle$ are alternatively described with the help of the transition probability density function. It is revealed, by numerical integrals, that the first few moments behave as $t^{-1/2}$ for large t. Monte Carlo simulations of the stochastic differential equation also confirm the occurrence of the noise-induced long-time tail. The numerical calculations are made in the case $n=3$. (13 refs.)

69996 Quantum Brownian motion. H.Grabert (Inst. fur Theoretische Phys., Univ. Stuttgart, Stuttgart, Germany), P.Talkner.
Phys. Rev. Lett. (USA), vol.50, no.18, p.1335-8 (2 May 1983).
A new master equation describing the irreversible process of a quantum mechanical Brownian particle is proposed. The master equation is shown to obey the symmetry of detailed balance leading to a quantum analog of the reciprocity relations, and the fluctuation-dissipation theorem is obtained. The method is applied to the damped harmonic oscillator. The relation to previous approaches is discussed. (7 refs.)

69997 Microcanonical Monte Carlo simulation. M.Creutz (Dept. of Phys., Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. Lett. (USA), vol.50, no.19, p.1411-14 (9 May 1983).
A new algorithm for the simulation of statistical systems is presented. The procedure produces a random walk through configurations of a constant total energy. It is computationally simple and applicable to systems of both discrete and continuous variables. (8 refs.)

69998 Photon correlation spectroscopy of the nonMarkovian-Brownian motion of spherical particles. K.Ohbayashi, T.Kohno, H.Utiyama (Faculty of Integrated Arts & Sci., Hiroshima Univ., Hiroshima, Japan).
Phys. Rev. A (USA), vol.27, no.5, p.2632-41 (May 1983).
The nonMarkovian-Brownian motion was studied by photon correlation spectroscopy on spherical particles suspended in viscous fluid. The nonMarkovian property has been expected to give rise to a long-time tail proportional to $t^{-3/2}$ in the velocity correlation function and, correspondingly, a term of the form $p_{1/2}t^{1/2}$ in the argument of the exponential function of the photon correlation spectroscopy. Measurements were done on polystyrene latex spheres of 0.804-μm diameter suspended in pure water. Results of the experimental determination of the coefficient $P_{1/2}$ at three different temperatures were 0.397 ± 0.035 $s^{-1/2}$ at 32.8°C, 0.326 ± 0.029 $s^{-1/2}$ at 28.0°C, and 0.267 ± 0.27 $s^{-1/2}$ at 23.5°C, the corresponding theoretical values being 0.409, 0.346, and 0.293 $s^{-1/2}$, respectively. Thus there is good agreement between the experimental values and the theoretical predictions. (32 refs.)

69999 Numerical evaluation of path-integral solutions to Fokker-Planck equations. M.F.Wehner, W.G.Wolfer (Nuclear Engng. Dept., Univ. of Wisconsin, Madison, WI, USA).
Phys. Rev. A (USA), vol.27, no.5, p.2663-70 (May 1983).
A numerical method, based on the path-integral formalism, is presented to solve nonlinear Fokker-Planck equations with natural boundary conditions. For one-dimensional stochastic processes, several specific examples possessing exact analytic solutions are evaluated numerically for purposes of comparison. Various discretization prescriptions are investigated and found to be equivalent as expected. The numerical method is shown to give accurate results provided the spatial discretization and the time step satisfy certain relationships determined by the drift and the diffusion functions of the nonlinear Fokker-Planck equations. (26 refs.)

70000 New type of 'crisis' showing hysteresis. Y.Yamaguchi, K.Sakai (Dept. of Phys., Sci. Univ. of Tokyo, Tokyo, Japan).
Phys. Rev. A (USA), vol.27, no.5, p.2755-8 (May 1983).
A new type of 'crisis' is found in a quadratic logistic map with periodic modulation. This shows a hysteresis followed from coexistence of two attractors. It is also shown that crises are characterized by discontinuous changes in the power spectrum and Lyapunov number. (18 refs.)

70001 Corrections to scaling in self-avoiding walks. S.Havlin, D.Ben-Avraham (Dept. of Phys., Bar-Ilan Univ., Ramat-Gan, Israel).
Phys. Rev. A (USA), vol.27, no.5, p.2759-62 (May 1983).
Corrections to scaling, as well as the critical exponent ν, are calculated for self-avoiding walks, with the use of a new highly accurate method based on fractal dimensionality. Numerical results are obtained for 2, 3, 4, and 5 dimensions and are shown to be in excellent agreement with the prediction of the $n=0$ vector model. (20 refs.)

70002 Intermittency—another route to chaos. D.J.Scalapino (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA), J.E.Hirsch, B.A.Huberman.
Melting, Localization, and Chaos. Proceedings of the Ninth Midwest Solid State Theory Symposium, Argonne, IL, USA, 2-3 Nov. 1981 (New York, USA: North-Holland 1982), p.243-57
The period-doubling or pitchfork bifurcation route to chaotic behavior of one-dimensional maps has been extensively studied. The authors review another route to chaotic behavior which occurs via intermittency. Near a tangent bifurcation, a one-dimensional map can exhibit long, regular sequences separated by irregular bursts. The authors illustrate this phenomena of intermittency using the logistic map. They then discuss how the average length of the regular regions scales with the parameter which controls how close the system is to the point of tangent bifurcation and also how it depends upon an applied stochastic noise. They conclude with a discussion of a renormalization group formulation of the problem of intermittency which illustrates the important ideas of universality. (20 refs.)

(see also 75.10H Ising models)

70003 Vectorial measures on vector lattices. H.Heinich (Lab. de Probabilites, Univ. Pierre et Marie Curie, Paris, France).
Ann. Inst. Henri Poincare Sect. B (France), vol.19, no.2, p.153-74 (1983). In French.
The purpose of this article is to show that for a sufficiently large class of non topological vector lattices, the order properties on real measures hold also for vector-valued signed measures. For this the author introduces the notion of *l-s* space whose positive linear forms verify a local condition of homomorphism and of sequential continuity with respect to order. After having classifical certain sets of measures he establishes for *l-s* spaces the inequalities of Chacon and the convergence of sub-additive processes as well as those of simple martingales. A second localization procedure—using the notion of 'order point'—allows him to reduce most classical spaces (lattices) to the former case. Finally he gives a version of the above properties for vector-valued random variables. (13 refs.)

70004 Percolation with 3-body or next nearest neighbor correlations. Li Tie-cheng (Inst. of Phys., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.1, p.65-8 (Jan.-March 1983). [received: May 1983]
The percolation problem for the 2-D triangular lattice of the quenched-correlated system is studied by using a real-space renormalization-group method. The many-body correlations for the occupied sites are considered by

Kirkwood's superposition approximation approach and those for occupied and unoccupied sites by a procedure which holds the conservation of probability. The scheme is applied to the case including 3-body correlation and to that with next nearest neighbor correlations. The author's conclusion is that, in either case the universality in critical phenomena of percolation is unchanged, even some complicated correlations are involved. (9 refs.)

70005 On states, on a lattice, with half-integral charge. J.S.Bell (CERN, Geneva, Switzerland), R.Rajaraman.

Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220 (FS8), no.1, p.1-12 (16 May 1983).

In certain molecular models, and related one-dimensional field theories, localized objects appear with half-integral expectation values of charge. The authors consider whether these states are eigenstates of charge, with half-integral eigenvalue. They find that it is indeed so for a suitably diffuse definition of the charge operator in question. This diffuse charge operator has a spectrum which approaches a continuum. The analysis is made on a lattice to avoid divergence ambiguities, and on a finite length, which is only subsequently made large. The half-integral charge phenomenon is not tied to solitons, but can also arise as an end effect. (14 refs.)

70006 Quantum inverse scattering method and the diagonal-to-diagonal transfer matrix of vertex models. T.T.Truong (Inst. fur Theoretische Phys., Freie Univ. Berlin, Berlin, Germany), K.D.Schotte.

Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220 (FS8), no.1, p.77-101 (16 May 1983).

The authors discuss a construction of Bethe ansatz eigenstates for the so-called diagonal-to-diagonal transfer matrix of two-dimensional vertex models on a square lattice, recently introduced by Bariev (1981, 1982). They show that the basis of the method again lies in the 'triangle equations' of the vertex model and construct a corresponding quantum inverse scattering method which can be generalised to Kagome and triangular lattices. (15 refs.)

70007 Self similarity and correlations in percolation. A.Kapitulnik, A.Aharony, G.Deutscher, D.Stauffer (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel).

J. Phys. A (GB), vol.16, no.8, p.L269-74 (1 June 1983).

The infinite cluster above the percolation threshold is shown by a scaling theory and Monte Carlo simulations to be homogeneous on large length scales (compared with the correlation length). On shorter length scales this cluster is self similar, and its measured fractal dimensionality agrees excellently with the scaling law $D=d-\beta/\nu$. The exponents β and ν are also measured, both from the crossover between the two length scale regions and from correlations near the boundaries. (18 refs.)

70008 Branched polymers with a prescribed number of cycles. S.G.Whittington (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada), G.M.Torrie, D.S.Gaunt.

J. Phys. A (GB), vol.16, no.8, p.1695-711 (1 June 1983).

The authors consider the number of lattice animals with exactly c cycles. For weakly embeddable (bond) clusters they show rigorously that the growth constant is independent of c and they derive upper and lower bounds on the critical exponents for each value of c. They use series analysis methods to estimate the critical exponents for $c=1$ and 2 in two and three dimensions and find that the critical exponent does depend on the number of cycles. Evidence from series analysis results and from expansions in inverse powers of the dimension suggests that, in the case of strong embeddings (i.e. site clusters) the growth constant is independent of c and the corresponding values of the critical exponents are identical to the values for weak embeddings (i.e. bond clusters). They discuss the relationship of these results to the field theory prediction that the critical exponent is independent of cycle fugacity. (17 refs.)

70009 Influence of the reaction field on the nature of the phase transition in the Potts model. R.Dekeyser (Inst. voor Theoretische Fysika, Katholieke Univ. Leuven, Heverlee, Belgium), A.Maritan, A.L.Stella.

J. Phys. A (GB), vol.16, no.8, p.1713-20 (1 June 1983).

It is shown how Onsager's reaction field may be incorporated in mean-field-like calculations for the q-state Potts model. Its influence on the nature of the phase transition is considered both in a one-site and a two-site cluster approximation. Considerable improvement is obtained for $q_c(d)$, the value which separates first- and second-order transitions. The way in which $q_c(d)$ is modified when a second-neighbour interaction is added to the ferromagnetic nearest-neighbour one is also studied. (18 refs.)

70010 Non-universal corrections to scaling for a lattice model. C.Smith (Dept. of Phys., Univ. of Edinburgh, Edinburgh, Scotland).

J. Phys. A (GB), vol.16, no.8, p.1771-94 (1 June 1983).

A field theoretic model derived from a lattice spin model is studied within the framework of the renormalisation group. To second order in $\epsilon=4-d$, where d is the dimensionality of the lattice, the non-universal fixed point and the amplitude of the leading correction to scaling for the susceptibility are determined for two types of lattice. The functional form obtained for the amplitude compares qualitatively well with high-temperature series work; in particular, it gives a prediction for the amplitude of corrections to scaling for the spin-$^1/_2$ Ising model on a body centred cubic lattice in three dimensions that is in fair numerical agreement with high temperature series estimates. (18 refs.)

70011 Droplet theory in low dimensions: Ising systems in zero field. A.D.Bruce, D.J.Wallace (Dept. of Phys., Univ. of Edinburgh, Edinburgh, Scotland).

J. Phys. A (GB), vol.16, no.8, p.1721-69 (1 June 1983).

The authors develop a theory of the universal configurational physics underlying critical point phenomena in the Ising universality class. The theory is formally justifiable in $d=1+\epsilon$ dimensions and may be regarded as the natural continuation of the kink-based theory of one dimension, which it incorporates as a limiting case. In $d=1+\epsilon$ the configurational building block is the droplet. The typical droplet is not spherical and the many-droplet assembly is not dilute: the implied problems are handled with renormalisation group methods. It is found that droplet shape fluctuation effects control the correlation length exponent ν, while the nesting of droplets within droplets control the order parameter exponent β. The exponents ν and β thus effectively define, respectively, the fractal dimensions of the droplet surface and the droplet volume. The theory is used to determine and illuminate the critical behaviour of further quantities including the free energy, the susceptibility, the droplet number distribution and the distribution of the intra-droplet order. (61 refs.)

70012 Theory of the phase boundary for cubic Ising lattices with pair-quartet interactions. B.Frank (Dept. of Phys., Concordia Univ., Montreal, Quebec, Canada), O.G.Mouritsen.

J. Phys. C (GB), vol.16, no.13, p.2481-96 (10 May 1983).

A theory is presented for the determination of the transition temperature T_c for spin-$^1/_2$ Ising models on cubic lattices with pair (J_2) and quartet (J_4) interactions. A linear relationship between T_c and J_4/J_2 is found to have a base wider in scope than that of previous theories. The calculation of the linear coefficient is performed through the derivation of a new equation for special four-spin correlation functions which is solved in a novel way by the use of a ratio approximation. The results are compared with those derived from previous theories, series analysis and Monte Carlo calculations which are also presented here. The linear coefficient is shown to depend on a parameter which turns out to have approximately the same value for all cubic lattices, thus suggesting a set of scaled variables in terms of which the phase boundary for all cubic lattices may be fitted by a common curve. From the authors' work a coherent picture emerges for the phase behaviour of cubic Ising lattices with pair and quartet interactions, involving regions of continuous and first-order transitions separated by a tricritical point which occurs at the same value of the scaled variables for all cubic lattices. (26 refs.)

70013 Exact models with a complete Devil's staircase. S.Aubry (Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA).

J. Phys. C (GB), vol.16, no.13, p.2497-508 (10 May 1983).

The author describes two exact models which exhibit a complete Devil's staircase which can both be calculated explicitly with the same method. The first one is a discrete Frenkel-Kontorova model (an elastic chain of atoms submitted to a continuous piecewise parabolic periodic potential). The atomic mean distance of the ground state varies with the model parameters as a complete Devil's staircase. The authors also calculates explicitly the Peierls-Nabarro barrier and the depinning force of the chain which is always locked on the periodic potential. (However, it is noted that the lack of differentiability of this periodic potential always makes the chain locked and the Devil's staircase complete, unlike the case for smooth periodic potentials.) The second model is the Ising chain under an external magnetic field and with long-range antiferromagnetic interactions proposed by Bak and Bruinsma (1982). It is rigorously proved that the ground state of this model is periodically modulated and that its magnetisation varies as a function of the magnetic field which is a complete Devil's staircase. This one is also explicitly calculated. (17 refs.)

70014 Convexity violations for noninteger parameters in certain lattice models. R.B.Griffiths, P.D.Gujrati (Dept. of Phys., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

J. Stat. Phys. (USA), vol.30, no.3, p.563-89 (March 1983).

The convexity of the free energy is studied for several lattice models in situations in which a parameter which is normally a positive integer takes on noninteger real values. Examples include the number n of components in the n-vector model, the number of states in the Potts model, and the dimensionality of the lattice. In a typical case there is a critical value of the parameter such that convexity is preserved when the parameter exceeds the critical value, but can be violated for appropriate Hamiltonians whenever the parameter is less than the critical value, but not a positive integer. In several cases the critical value of the parameter increases with the size of the systems, thus raising questions about the significance of a continuous variation of the parameter in the thermodynamic limit. (27 refs.)

70015 On the method of Symes for integrating systems of the Toda type. V.Guillemin (MIT, Cambridge, MA, USA), S.Sternberg.

Lett. Math. Phys. (Netherlands), vol.7, no.2, p.113-15 (March 1983).

Let $G=KL$ and $g=k+l$ be Lie group and Lie algebra decompositions. This identifies k^0 with l^*. The authors prove a formula which says that the integral curve through $\alpha\in k^0$ is obtained as $b(t)\alpha$, where $\alpha(t)=\exp t\xi$ with $\xi=L_f(\alpha)$, and $a(t)=b(t)c(t)$, and where $L_f:g^*\to g$ is the Legendre transform. This generalizes a formula of Symes (1980) for the generalized Toda lattice. (10 refs.)

70016 Higher order calculations for *d*-dimensional lattice with *d′*-dimensional defect. R.Abe (Dept. of Pure & Appl. Sci., Univ. of Tokyo, Tokyo, Japan), K.Yamamoto, K.Ideura.

Prog. Theor. Phys. (Japan), vol.69, no.2, p.464-79 (Feb. 1983).

Using $1/n$ expansion, the n-vector model in a d-dimensional lattice is studied where a d-dimensional defect exists. Previous theories which dealt with the $n\to\infty$ limit are extended up to the order λ/n (λ: a parameter specifying the strength of defect). The pair correlation function in the defect space is discussed for the three-dimensional lattice. A critical exponent $\eta_\parallel$ pertaining to the critical correlation is calculated up to the same order. (17 refs.)

70017 Solution of operator field equations by the method of finite elements. C.M.Bender (Dept. of Phys., Washington Univ., St. Louis, MO, USA), D.H.Sharp.

Phys. Rev. Lett. (USA), vol.50, no.20, p.1535-8 (16 May 1983).

A method is proposed for the approximate numerical solution of operator field equations on a lattice. (4 refs.)

70018 Description of the phase with broken symmetry in the Ising model by the method of quasi-averages. Yu.P.Virchenko (Physicotech. Inst., Acad. of Sci., Kharkov, Ukrainian SSR).

Theor. & Math. Phys. (USA), vol.52, no.3, p.927-38 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.473-90 (Sept. 1982). [received: May 1983]

A system of equations for the correlation functions of the Ising model is obtained. It is shown that this system of equations is solvable at a sufficiently low temperature and a rapidly converging iterative procedure is constructed which makes it possible to calculate with arbitrarily high accuracy the equation of state and the correlation functions of the Ising model. The first terms of the perturbation theory series are given. (10 refs.)

05.60 TRANSPORT PROCESSES: THEORY

70019 Exact stationary solutions of kinetic equations describing particle coalescence. L.I.Vinokurov, O.V.Kats.

Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.4, p.55-7 (1983). In Ukrainian.

Power, mass and momentum distributions resulting from particle collision with coalescence in the presence of a source and sink are obtained as exact stationary solutions of the kinetic equation. The collision integral symmetry for uniform probability of the general transition is used as in the theory of weak turbulence. The transition to the coagulation equation is made by averaging of the kinetic equation for momenta and the corresponding mass distributions are obtained. Dust particle coalescence in space which presents a practical interest is considered as a particular example. Locality of the distributions formed is investigated. (12 refs.)

70020 Film models for multicomponent mass transfer: a statistical comparison. L.W.Smith (Indiana Inst. of Technol., Fort Wayne, IN, USA), R.Taylor.
Ind. & Eng. Chem., Fundam. (USA), vol.22, no.1, p.97-104 (Feb. 1983).
The rates of multicomponent mass transfer predicted from several approximate solutions of the Maxwell-Stefan equations for a film model of steady-state diffusion are compared with the fluxes calculated from an exact solution for many hundreds of thousands of example problems. It is found that the assumption that the matrix of multicomponent diffusion coefficients remains constant is an excellent one and that the solution of the linearized equations due to H.L. Toor (1964) and to W.E. Stewart and R. Prober (1964) always provides adequate estimates of the mass-transfer rates. The method of R. Taylor and L.W. Smith (1982) is the better of two explicit methods, bettering even the solution of the linearized equations in a number of cases. (49 refs.)

70021 The one-dimensional diffusion process and unitary representations of R^1. M.P.Heble (Dept. of Math., Univ. of Toronto, Toronto, Canada).
J. Math. Anal. & Appl. (USA), vol.93, no.2, p.363-84 (May 1983).
Given a cocycle $a(t)$ of a unitary group $\{U^t\}$, $-\infty<t<\infty$, on a Hilbert space $\mathcal{H}$, such that $a(t)$ is of bounded variation on $[0,T]$ for every $T>0$, $a(t)$ is decomposed as $a(t)=\int_0^t U^s x\, ds+\beta(t)$ for a unique $x\in\mathcal{H}$, $\beta(t)$ yielding a vector measure singular with respect to Lebesgue measure. The variance is defined as $\sigma^2(\{U^t\}, a(t))=\lim_{T\to\infty}(1/T)\|\int_0^t U^s x\, ds\|^2$ if existing. For a stationary diffusion process on R^1, with Ω_1 the space of paths which are natural extensions backwards in time, of paths confined to one nonsingular interval J of positive recurrent type, an information function $I(\omega)$ is defined on Ω_1 based on the paths restricted to the time interval $[0,1]$. It is shown that $I(\omega)$ is continuous and bounded on Ω_1. The shift τ_1 defines a unitary representation $\{U^t\}$. Assuming $\int_{\Omega 1} I\, dm=0$, dm being the stationary measure defined by the transition probabilities and the invariant measure on J, $I(\omega)$ has a C^∞ spectral density function f. It is then shown that $\sigma^2(\{U^t\},I)=f(0)$. (30 refs.)

70022 A new fourth-order finite-difference method for solving discrete-ordinates slab transport equations. B.Neta, H.D.Victory,Jr. (Dept. of Math., Texas Tech. Univ., Lubbock, TX, USA).
SIAM J. Numer. Anal. (USA), vol.20, no.1, p.94-105 (Feb. 1983).
A theoretical study is made of a new fourth-order finite-difference scheme for spatially discretising the discrete-ordinates equations for solving numerically the slab transport (Boltzmann) equation. This analysis considers the quadratic continuous method, whose derivation parallels that of the commonly used diamond difference and linear discontinuous schemes from balance equations for particle conservation across a spatial cell. A convergence analysis of this method is provided and it is proven that superconvergence phenomena are present for cell-edge and cell-average fluxes. Results from an S_2-test problem are also presented to show that the asymptotic convergence rates are observed on rather coarse spatial meshes. (10 refs.)

70023 A Monte Carlo study of the entropy, the pressure, and the critical behavior of the hard-square lattice gas. H.Meirovitch (Chem. Phys. Dept., Weizmann Inst. of Sci., Rehovot, Israel).
J. Stat. Phys. (USA), vol.30, no.3, p.681-98 (March 1983).
An approximate technique for estimating the entropy S with computer simulation methods, suggested recently by Meirovitch (1977), is applied here to the Metropolis (1953) Monte Carlo (MC) simulation of the hard-square lattice gas in both the grand canonical and the canonical ensembles (1963). The chemical potential μ, calculated by Widom's (1963) method, and S enable one to obtain also the pressure P. The MC results are compared with results obtained with Pade approximants (PA) and are found to be very accurate. The author also calculates the critical exponents by applying Fisher's (1967) finite-size scaling theory to the results for the long-range order, the compressibility and the staggered compressibility, obtained for several lattices of different size at z_c. The data are consistent with the critical exponents of the plane Ising lattice $\beta=1/8$; $\nu=1$, $\gamma=7/4$, and $\alpha=0$. (49 refs.)

70024 The question of an upper bound on entropy. A.Qadir (Internat. Centre for Theoretical Phys., Trieste, Italy).
Phys. Lett. A (Netherlands), vol.95A, no.6, p.285-6 (9 May 1983).
The author discusses the possibility, and significance, of an upper bound on entropy in the light of the arguments of Bekenstein (1982) and Unruh and Wald (1982). He obtains a stricter bound than Bekenstein does, and points out some limitations with regard to its significance. (6 refs.)

70025 Critical behavior of a KAM surface. II. Renormalization approach. L.P.Kadanoff (James Franck & Enrico Fermi Insts., Univ. of Chicago, Chicago, IL, USA).
Melting, Localization, and Chaos. Proceedings of the Ninth Midwest Solid State Theory Symposium, Argonne, IL, USA, 2-3 Nov. 1981 (New York, USA: North-Holland 1982), p.209-41
Scaling and renormalization arguments are applied to critical KAM trajectories, which appear in the Chirikov-Taylor model (1979). The renormalization is constructed with the aid of a generating function, or action, and the renormalization equation is the principle of least action. After many renormalizations, the action is observed to achieve a scale invariant form. Fixed point equations, and then a fixed point for the action are constructed. Critical indices are evaluated which are in good agreement with previous work. However, numerical errors plus near marginality of the recursion relations permit a doubt about whether the formulation has been fully confined. (8 refs.)

70026 Josephson volt standard at the National Physical Laboratory, New Delhi. N.S.Natrajan (Div. of Specialised Tech. Cryogenics, Nat. Phys. Lab., New Delhi, India).
Indian J. Cryog., vol.7, no.4, p.194-9 (1982).
A Josephson volt standard set up is almost in operation at the National Physical Laboratory, New Delhi, A cryostat holding a Josephson junction, a stabilised microwave system and an electronic biasing circuit have been prepared and these were tested at the Physikalisch-Technische Bundesanstal (PTB), Braunschweig, West Germany by the author. This paper describes in detail the construction of the cryostat, the assembling of the stabilised microwave system and the features of the electronic biasing circuit and how these could be utilised in the comparison of the Josephson voltage against the standard cell volt. Four standard cells in a commercial constant temperature enclosure have been compared against PTB volt standard and against the Josephson volt standard set up by the author at PTB and the results are given. The accuracy of the comparison with this Josephson volt standard set up is found to be of the order of a few parts in 10^7. (3 refs.)

70027 Relativistic effect on atomic clocks. Y.Saburi (Ministry of Posts & Telecommunications, Koganei, Japan).
J. Inst. Electron. & Commun. Eng. Jpn. (Japan), vol.66, no.1, p.60-3 (Jan. 1983). In Japanese.
As is known; if two observers, one at rest and the other moving with a constant velocity, measure the velocity of propagation of the same light beam, they both obtain the same value, c. In other words; the postulate of the invariance of length, time, mass and force has been replaced by the postulate of the invariance of the velocity of light. This postulate leads to the transformation of Lorentz. When time measurements are made on or near the Earth, the effect of revolution of the Earth on its axis and around the Sun should be taken into account. Principles and experiments of time correction for this are briefly described in this paper. It is shown that the correction can be made with an error within 0.1 to 1 ns. (7 refs.) *K.B.*

70028 A split second isn't fast enough. J.Pilkington (Royal Greenwich Astron., Hailsham, England).
Natl. Electron. Rev. (GB), vol.18, p.24-8 (1983).
It is now possible to keep time so accurately that it is possible to buy a fairly cheap wristwatch and say, with some justification, that it never goes wrong. But several professions need time-keepers more accurate than that by several orders of magnitude. Electronics is helping them achieve it. The author joined the Royal Greenwich Observatory in 1969 to work on astronomical instrumentation, and became head of the Time Department in 1976. He has worked in an international intergovernmental committee on the Definition of the Second. His main work at present is the satellite laser ranging facility at Herstmonceux which should become operational this year. He also describes both the quartz crystal clock and the Cs-beam resonance clock. (no refs.)

70029 Laser frequency measurements and the redefinition of the meter. P.Giacomo (Internat. Bur. of Weights & Measures, Sevres, France).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.244-6 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
The use of an atomic wavelength to define the meter assumes the permanence and universality of the atomic energy levels, Planck's constant, and the speed of light. The new definition proposed for the meter is based upon the path length traveled by light in a specified duration. Limitations of the implementation of the new definitions are discussed. In early 1980s, very few determinations of visible frequencies have been performed that may claim an accuracy exceeding 10^9. Progress in this respect will open the way to an easier implementation of the new definition of the meter. It is also a key to extend to the IR and visible range the electromagnetic high-frequency techniques. Frequency standards in this range would then have a definite appeal. (no refs.)

70030 The eikonal approximation applied to sizing transparent fibres using the scattered intensity-ratio technique. S.K.Sharma, D.J.Somerford (Phys. Dept., Univ. Coll., Cardiff, Wales).
J. Phys. D (GB), vol.16, no.5, p.733-42 (14 May 1983).
The first-order corrected eikonal approximation (FCEA) has been used as an approximation to the exact theory for fibre size measurements by the forward lobe scattering intensity-ratio technique. Fibre diameters in the range 0.20-4.00 μm are considered. Intensity ratio curves are presented as a function of fibre size parameter at angle pairs 5°/2.5°, 10°/5° and 20°/10°. A comparison with similar curves based on the exact scattering theory has been made and the percentage error in size parameters obtained using FCEA has been tabulated for relative refractive indices $m=1.05$ and 1.15. (21 refs.)

70031 Errors in planimetry. E.V.Voinich, A.T.Lebedev, V.A.Novikov, L.P.Troshin, L.A.Baranov.
Meas. Tech. (USA), vol.25, no.8, p.636-8 (Aug. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.8, p.16-17 (Aug. 1982). [received: April 1983]
It is common practice to use planimeters to determine the areas of diagrams drawn by pen recorders in order to calculate overall or mean values. Statistical analysis of the instrumental errors, errors caused by the individual features of the user, and errors due to the working conditions is presented. (3 refs.)

70032 Errors in measuring the relative coordinates of two reflectors. G.V.Merkishin.
Meas. Tech. (USA), vol.25, no.8, p.647-9 (Aug. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.8, p.24-6 (Aug. 1982). [received: April 1983]
The comparison of the interference method with the common scanning-beam method indicates that it is much simpler to realise high accuracy with the former. The results can be used for designing an effective system for measuring the distance between reflectors. (9 refs.)

70033 Artefact peaks in particle size distributions measured by the electrical sensing zone (Coulter counter) method. C.M.L.Atkinson, R.Wilson (Div. of Mech. & Optical Metrology, NPL, Teddington, England).
Powder Technol. (Switzerland), vol.34, no.2, p.275-84 (March-April 1983).
Artefact peaks on the coarse side of particle size distributions measured via the electrical sensing zone (ESZ) technique for a series of copolymer lattices have been examined. These artefacts result from particles entering the orifice mouth at the periphery. It is shown that the 'volume' shift of the artefact peak relative to the main or normal peak may be calculated from the equation $d\phi/dx \propto 1+\alpha'\{(r/R)/(1-r/R)\}^{\beta'}$ where $d\phi/dx$ is the axial component of the potential gradient across the mouth of the orifice, of radius R, at a radial distance r from the axis; α' and β' are constants with values of 0.0324 and 1.082 respectively. The relative modal heights of the artefact and main peaks are also accounted for. The occurrence of artefact peaks can introduce difficulties in the use of the 'half-count' method of calibration; a preferred alternative method involves identification of the modal value of the main peak in the measured ESZ size distribution of the reference material used for calibration. 06.30E Mass and density measurement

70034 An improved hydrostatic apparatus. S.I.Toropin.
Meas. Tech. (USA), vol.25, no.8, p.667-9 (Aug. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.8, p.38-9 (Aug. 1982). [received: April 1983]
The accuracy of measurement in hydrostatic weighing is restricted by the balance, the support, the working liquid, and the methods of loading the specimen and weight onto the support. An improved hydrostatic apparatus is described which provides for thermostatting the working liquid, eliminates evaporation from the surface of the liquid, removes any vertical temperature gradient and suppresses convection currents in the liquid. The standard deviations in volume measurements is $\sigma=3.10^{-5}$ cm^3 for measurements on weights of mass from 1 to 500 g and $\sigma=8.10^{-5}$ cm^3 in measurements on weights of mass 1 kg. (2 refs.)

06.30F Time and frequency measurement

(for astronomical aspects see 95.70)

70035 Merits and limitations of submillimeter wavelength frequency standards based on an Mg(Ca) metastable beam. A.de Marchi (Istituto Elettrotecnico Nazionale 'Galileo Farraris', Torino, Italy), E.Bava, A.Godone, G.Giusfredi.
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.191-7 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
Magnetic field independent transitions in Mg(Ca) metastable levels were recognized as metrologically interesting for the realization of high-performance frequency standards in the submillimeter wavelength region. The authors present an analysis of their merits, theoretical limitations, and technological difficulties. Projections are made for the performance of standards based on these transitions. (15 refs.)

70036 A new heart for Rb frequency standards?: the evacuated, wall-coated sealed cell. H.G.Robinson (Phys. Dept., Duke Univ., Durham, NC, USA), C.E.Johnson.
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.198 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
^{87}Rb hyperfine resonances observed in an evacuated, wall-coated cell, sealed since 1968, exhibit linewidths of $\sim$10 Hz for the narrow Lorentzian feature. The high-resonance Q of 0.65×10^9 shows good promise for the potential use of such cells in Rb frequency standards. (5 refs.)

70037 Characterization of frequency stability: bias due to the juxtaposition of time-interval measurements. P.Lesage (Lab. de l'Horloge Atomique, Univ. Paris-Sud, Orsay, France).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.204-7 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
The characterization of frequency stability is usually achieved by means of numerically processed time-interval measurements. The author has studied the bias occurring in the frequency stability measure when successive data with the same mean durations are added in order to get different sets of samples with various mean durations. The effect of a dead time between the data involved in the considered algorithm is pointed out. An experimental analysis is presented which checks the theoretical results for several frequency standards. (7 refs.)

70038 Automated timekeeping. II. K.Putkovich (US Naval Obs., Washington, DC, USA).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.214-17 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
For pt.I see ibid., vol.IM-21, p.401-5 (Nov. 1972). An automated system presently used by the US Naval Observatory (USNO) for determining, maintaining, and disseminating precise time and time interval (PTTI) to a worldwide community of scientific and military users is described and evaluated on the basis of present capabilities and future requirements. The objective of the system is to provide near-real-time dissemination of PTTI information from a master clock time scale with a stability in excess of a few parts in 10^{-14}. (5 refs.)

70039 A compact hydrogen maser with exceptional long-term stability [measurement standards]. D.A.Howe, F.L.Walls (Time & Frequency Div., NBS, Boulder, CO, USA).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.218-23 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
A compact passive hydrogen maser with many unique features, including a significant reduction in size over previous hydrogen masers, is described. It uses the passive mode of operation, thereby permitting use of a small microwave TE_{011} cavity which is dielectrically loaded by a low-loss alumina (Al_2O_3). The cavity is 14.6 cm outside diameter and 13.7 cm high, and weighs only 4.4 kg. the unloaded-cavity Q factor is about 6000. With a conventional source, hexapole state selector, and four magnetic shields, the volume of the entire hydrogen maser resonator package is only about 20 l. Stability data compiled from four compact hydrogen masers built at NBS is presented. Comparisons are made against the cesium standard NBS-4 and a time scale comprised of nine commercial cesium standards. (9 refs.)

70040 Performance of the four NRC long-beam primary cesium clocks Cs V, Cs VIA, Cs VIB, and CS VIC. A.G.Mungall, C.C.Costain (Div. of Phys., Nat. Res. Council, Ottawa, Ontario, Canada).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.224-7 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
Performance of the four laboratory primary cesium clocks at the National Research Council (NRC) is outlined and the results of both internal and external time scale comparisons described. Difficulties which have been experienced with these clocks, including failures in both the microwave resonance excitation systems and the vacuum systems are discussed. The results of seven years of primary clock operation for Cs V and over two years for the three Cs VI clocks show that all the clocks have operated well within their estimated accuracy and stability limits of $\pm1\times10^{-13}$ for Cs V and $\pm1.5\times10^{-13}$ for Cs VIA, Cs VIB, and Cs VIC. 70041 International intercomparison of electric-field strength at 100 MHz. C.F.Stubenrauch (NBS, Boulder, CO, USA), P.G.Galliano, T.M.Babij.
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.235-7 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
Discusses an international intercomparison of electric field at 100 MHz. Laboratories in four countries participated in the intercomparison. Measurements from each of the laboratories fell within a range of +0.75 to −0.5 dB with respect to the overall average. The transfer standard used in the measurement is described and the details of the results are presented. (1 ref.)

06.70 GENERAL INSTRUMENTATION

70044 The hobby 'scope [CRO]. C.Murphy.
Hobby Electron. (GB), vol.5, no.6, p.11-13 (June 1983).
The author discusses the design of a low cost modular oscilloscope which can be constructed by the hobbyist for under £80. For maximum flexibility, the instrument has been divided into separate functional units or modules; for under £40 there is an X-Y plotter (display unit) which will operate with either the scope add-on, to provide a full single trace oscilloscope or the curve tracer add-on, which is a useful tool for component testing and identification. A basic outline of the equipment is given while the actual constructional details will be presented in subsequent articles. (no refs.)

70045 Sensors and transducers based on optical fibres.
Regul. & Mando Autom. (Spain), vol.17, no.125, p.67-71 (Jan.-Feb. 1983). In Spanish.
Indicates that the advantages of optical fibres permit their use in infra-red pyrometry in positions not readily accessible and, since they require no electric power supplies, that they are suitable for use in inflammable media. Because transmission is affected by lack of coaxiality in the junctions of the cables, this phenomenon can be used to detect very small displacements. Optical fibres can, consequently, be used in hydrophones, in relays to detect motion and in anemometers. Besides discussing the characteristics of multimode fibres and their application in acoustic pressure sensors, the article discusses the phase modulation of monomode fibres and the uses to which this phenomenon can be put, as, for example, detecting the phase variation of a monomode fibre as a very sensitive means of measuring temperature. Since the light transmitted through optical fibres can be polarised, they can be used to meter current in high tension lines thus eliminating the problems involved in using current transformers. (no refs.) *G.W.*

70046 Faster and more precise measurements [oscilloscope developments].
Funkschau (Germany), no.8, p.65-6 (15 April 1983). In German.
A brief description of the latest 4 models from Tektronix. The two 2-channel portable oscilloscopes, types 2235 and 2236, cover a bandwidth of 100 MHz, are very bright (Ultor voltage of 14 kV) and have various facilities, for example single stroke mode for photography; the 2236 model contains a counter/timer/multimeter unit with a separate display, which is integrated with the time base and trigger system of the basic instrument. The 4-channel model 2445 is distinguished by a bandwidth of 150 MHz, 1 ns/div resolution and a trigger bandwidth of 250 MHz. Group delay differences between channels 1 and 2 can be automatically cancelled. The most complex and expensive model 2465 doubles the above performance and provides facilities for grating, locking and displaying various frequency, phase, amplitude and delay observations. (no refs.) *A.L.*

70047 A high-pressure regulator. A.N.Zisman, V.N.Kachinskii (Inst. of Crystallography, Acad. of Sci., Moscow, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1036-7 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.232-3 (July-Aug. 1982). [received: May 1983]
In investigations of phase transitions it becomes necessary to keep thermodynamic parameters constant with a high degree of accuracy. A pressure regulator which uses an auxiliary thermocompressor and a manganin pressure transducer is described. The short-time pressure stability is 0.01 bar while the long-time stability (of the order of days) reaches 0.1 bar. The regulator can be used in high-pressure apparatus with operating pressures of up to 10-20 kbar. (5 refs.)

70048 Simulation method of checking RUS capacitance level gauges. A.G.Safin, A.I.Troegubov, V.A.Fedorov, G.Z.Salganik, S.T.Taranenko.
Meas. Tech. (USA), vol.25, no.8, p.654-5 (Aug. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.8, p.29-30 (Aug. 1982). [received: April 1983]
The usual method of checking the RUS capacitance level gauges consists of measuring the electrical capacitance of the sensing element SE when this is filled with a medium and comparing the output signal with the actual values of the level. A simulation method which greatly reduces the cost and time involved in the operation is described. The output parameter of the SE is not measured in the presence of a medium, but instead one measures the electrical equivalent and makes allowance for the characteristics of the medium and the properties of the particular SE. The method enables one to perform metrological evaluation of the gauges during production and under wording conditions. (2 refs.)

70049 Pulsed magnetic field calibrations for transducers for rapidly changing pressures. B.A.Vagin, V.S.Mamutov, A.I.Oreshenkov, S.M.Tarelkin.
Meas. Tech. (USA), vol.25, no.8, p.656-7 (Aug. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.8, p.30-1 (Aug. 1982). [received: April 1983]
Describes a dynamic calibration method that enables one to calibrate transducers over wide frequency and pressure ranges. A pulse is provided at the transducer by means of a flat coil and a pulse-current generator PCG with a capacitance store. Calibration amounts to comparing the transducer signal with the calculated pressure. The limiting accuracy in measuring the pulse pressure is dependent on the accuracy with which the signal is recorded on the oscilloscope. The length of the calibration pressures is dependent on the period of the discharge current, which is in the range 10-200 μsec with capacitor stores. The maximum pressure amplitude for a Cu foil thickness of 0.05 mm is 2.10^6 Pa. (2 refs.)

70050 Device for measuring the motion parameters of an object with a smooth conducting surface. V.A.Zinin.
Meas. Tech. (USA), vol.25, no.8, p.661-3 (Aug. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.8, p.34-5 (Aug. 1982). [received: April 1983]
A measurement transducer employing a transformer circuit with two measuring windings which form a bridge circuit with three resistors is described and the balance conditions for this circuit are presented. A device in which the measuring windings are miniature inductive probes that are independent of the exciting winding and which are placed directly on the exciting winding along the longitudinal axis of symmetry is described. The device enables one to measure accelerations in the range 0.01-10 g from the instantaneous velocity, together with the parameters of low-frequency vibration processes. (9 refs.)

70051 Silicon micromechanical devices. J.B.Angell, S.C.Terry, P.W.Barth.
Sci. Am. (USA), vol.248, no.4, p.36-47 (April 1983).
Tiny valves, nozzles, pressure sensors and other mechanical systems can be chemically etched in a wafer of single-crystal silicon. Such devices can be mass-produced much as microelectronic circuits are. (no refs.)

70052 Basis, performance and evaluation of ionization smoke-detectors. II. Chamber sensitivity and technical design. G.Meyer (Friedrich Merk-Telefonbau GmbH, Munchen, Germany).
Tech. Mess. tm (Germany), vol.50, no.4, p.155-61 (April 1983). In German.
For pt.I see ibid., no.3, p.93-7 (1983). Temperature, pressure and humidity affect the density of the chamber gas and consequently the specific ionization, the ion mobility and the recombination coefficients are also affected. The physics of ionization under these changeable conditions is discussed and equations are derived for calculating the range of α-particles, the number of ions per unit volume etc. Small ions experience acceleration in an electric field and are also affected by air streams which result in an additional velocity component, and in some losses of ions. The flight time of ions under these conditions are calculated and the mechanism of possible losses caused by air streams is graphically explained. The construction of the smoke detector as well as diagrams of amplification arrangements for voltage and current are

shown. The approximate solutions given enable optimization of the smoke chamber and quantification of the effects of some operational parameters. (22 refs.) *G.R.S.*

07.00 SPECIFIC INSTRUMENTATION AND TECHNIQUES OF GENERAL USE IN PHYSICS

(see also within each subdiscipline for specialized instrumentation and techniques)

07.10 MECHANICAL INSTRUMENTS AND MEASUREMENT METHODS

(for measurement in the mechanics of solids and rheology, see 46.30R; for materials testing, see 81.70)

70053 Device for producing uniaxial deformation in the surface layer of crystals. A.M.Saitsev, V.D.Kopanov, A.A.Gippius (P.N. Lebedev Inst. of Phys., Acad. of Sci., Moscow, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1029-31 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.226-7 (July-Aug. 1982). [received: May 1983]
The device described makes it possible to produce tensile or compressive deformation in the surface layer of crystals by bending the specimens. The advantages of the device include the absence of elements under a high mechanical load as well as the possibility of using specimens of comparatively simple shape and causing deformation in the ⟨100⟩, ⟨111⟩, and ⟨110⟩ directions in a single wafer, cut parallel to the (110) plane. The device can operate at low temperatures. (2 refs.)

70054 Mechanical test stand for the measurement of the vibration levels of chain saws during cutting operations. D.D.Reynolds (Joiner-Pelton-Rose Inc., Dallas, TX, USA), F.L.Wilson.
J. Sound & Vib. (GB), vol.88, no.1, p.65-84 (8 May 1983).
A mechanical test stand and corresponding test procedures for measuring the vibration levels of chain saws during cutting operations was developed for the Chain Saw Manufacturers Association. The stand includes mechanical coupling devices that approximate the dynamic response characteristics of the hand to clamp the top and rear saw handles. The stand is designed so that saws of all types and shapes can be tested. Results of hand-held and machine-held vibration tests on chain saws are discussed. The overall correlation between the vibration levels obtained from the hand-held and machine-held vibration tests on specified chain saws was good. (3 refs.)

70055 Parameter certification for the elastic components in string transducers. V.E.Mel'nikov, V.I.Obukhov, E.P.Gromov.
Meas. Tech. (USA), vol.25, no.8, p.663-5 (Aug. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.8, p.35-6 (Aug. 1982). [received: April 1983]
Flat springs are widely used as elastic components in various instruments, and the accuracy of the instrument reading is largely dependent on the accuracy in making or selecting the springs. The authors consider the scope for using a string transducer to certify the parameters of flat springs. The quartz string transducer QST is made from optically pure fused quartz in welded form and is designed to measure forces in the range from 0 to 0.6 N. Experimental results obtained during three successive cycles of loading and unloading indicate that QST can be used to check flat springs with an error of measurement of about 0.5%. (2 refs.)

70056 A new kind of gyro that isn't really a gyro at all. A.J.Street, J.R.Wilkinson (British Aerospace, Brackness, England).
Natl. Electron. Rev. (GB), vol.18, p.69-72 (1983).
Gives a general view of the operation and design of a ring laser gyroscope for use in an inertial navigation system. Particular attention has been paid to error sources, to indicate where the major problems lie. By paying suitable attention to the topics discussed, and providing engineering solutions to the many practical problems involved, gyros have been produced which have a performance well within an order of magnitude of the required accuracy. (6 refs.)

07.20D Thermometry

70059 Thermocouple interconnection for high accuracy. N.Macdonald (Ancom Ltd., Cheltenham, England).
Electron. & Power (GB), vol.29, no.5, p.412-13 (May 1983).
Any interconnections in the construction of a thermocouple-based temperature-measuring system must be made so that no unwanted characteristics are introduced to the system. The provision of a built-in reference and the use of compensating metals can provide a solution to the problem. Permanent or removable connections can be formed in six ways which are all described and their pro's and con's discussed. (no refs.)

70060 Thermometer based on the oscillator effect. V.M.Bondar, E.A.Sidorenko, V.V.Yakovlev (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1033-4 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.229-30 (July-Aug. 1982). [received: May 1983]
Describes a temperature sensor, operating on the basis of the oscillator effect, with a frequency output of the useful signal. The sensor is fed individual or infrequently repeated pulses of duration 4-10 msec and amplitude 40-80 V. The amplitude of the useful signal is 0.5-3 V. The range of temperatures measured is −70 to +70°C. (6 refs.)

70061 Thermometric study of corrosion behaviour of high strength Al-Mg alloy in phosphoric acid in presence of halides. B.N.Oza (Chem. Dept., Sardar Vallabhai Regional Coll. of Engng. & Technol., Surat, India).
Trans. SAEST (India), vol.17, no.4, p.281-5 (Oct.-Dec. 1982). [received: May 1983]
The feasibility of the Mylius thermometric technique of studying corrosion behaviour of high-strength Al-Mg alloy in phosphoric acid has been studied. The effect of halide ions on the corrosion behaviour of the material is also examined. Thermometric curves reporting the dissolution of material in various concentrations of H_3PO_4 are obtained. The maximum temperature attained even in the higher concentration of acid is not much but time needed to reach T_{max} is more except in 25% H_3PO_4. The reaction number (RN) increases with acid concentration. Addition of various amounts of halides gives interesting results. The curves reporting the variation of RN with concentration of additives show that in lower concentration, F^- interferes with corrosion reaction whereas in higher concentration favours corrosion. Cl^- and Br^- however stifle the corrosion and afford considerable protection to the material. (14 refs.)

70062 A monolithic conditioner for thermocouple signals. A.P.Brokaw (Analog Devices Corp., Wilmington, MA, USA).
1983 IEEE International Solid-State Circuits Conference. Digest of Technical Papers, New York, USA, 23-25 Feb. 1983 (New York, USA: IEEE 1983), p.238-9, 311
The author describes an IC which by combining ice point cold junction compensation with a low level instrumentation amplifier is suitable for use with thermocouple temperature transducers. The amplifier combines the signal obtained from a thermocouple, referred to the IC temperature, with cold junction compensation voltage derived from the compensation circuit and amplifies the sum to a level nominally equivalent to 10 mV/°C of the measurement thermocouple temperature. The resulting output is as if the thermocouple has been referred to an ice bath, rather than the IC temperature, and its output signal has been raised to a more convenient level. Additional features of the circuit include single or dual power supply operation and an input overload detector which may be used as an alarm, indicating an open thermocouple. With the thermocouple input shorted, the circuit becomes a calibrated Celsius temperature sensor with a linear 10 mV/°C output. The pin strapped feedback permits the circuit to be reconfigured as a set point controller. (no refs.)

70063 High temperature production by microwaves. J.C.Badot (ENSCP, Paris, France).
Rev. Int. Hautes Temp. & Refract. (France), vol.19, no.2, p.65-76 (1982).
Microwaves can be used for the production of high temperatures. By this method, it is possible to heat many refractory oxides (SiO_2, Al_2O_3, ZrO_2, rare earth oxides, etc.) up to their melting temperature. Various applications of the microwave technique may be considered, including crystal growth in self-crucible, and solid state reactions under high electric fields. (9 refs.)

70064 The cycle of a helium refrigerator with a steam-liquid turboexpander. V.I.Ardashev, D.I.Plachendovskii.
Izv. VUZ Mashinostr. (USSR), no.3, p.91-5 (1983). In Russian.
Results are presented of a computer-aided variational analysis to determine optimum parameters of two types of compressor in a cryogenic installation,

using a turboexpander in a saturated steam region and turboexpanders at intermediate cooling stages. The mathematical model supplied relates the efficiency of the turbomachines with the operating parameters under different conditions. The structure of the computer programme is presented. The lower limit of the refrigeration capacity of the installation, at optimum parameters of the cycle, is established. (11 refs.) *Z.F.V.*

70065 L'Air Liquide helium refrigerators and liquefactors. G.Gistau (Refrigeration Dept., L'Air Liquide, Paris, France).
Indian J. Cryog., vol.7, no.4, p.162-7 (1982).
Today, helium refrigeration is to be used in different fields: superconducting coils to get very high magnetic fields for particle analysis, particle accelerators, cryoelectricity (AC generation), power generation (fusion); Power transmission lines; cooling of neutron beams in research nuclear reactors. How does L'Air Liquide meet the requirements of the above applications? Main features concerning technology used by L'Air Liquide to build helium refrigerators or liquefiers (compressors, heat exchangers, cryogenic expanders, control systems, cryogenic storages and transfer lines). Some standard or special equipment are described with slide projection. (1 ref.)

70066 Preliminary design of reverse Stirling cycle refrigerator. A.B.Fakolawala, P.R.Tailor (Dept. of Mech. Engng., SVR Coll. of Engng. & Tech., Surat, India).
Indian J. Cryog., vol.7, no.4, p.172-6 (1982).
This paper deals with the development of consolidated chart by optimizing the parameters involved in the Schmidt analysis. The chart thus developed is used for preliminary design states of reverse Stirling cycle refrigerator—with illustrated example. (3 refs.)

70067 Development of rotating liquid helium dewar with transfer coupling. K.A.Durga Prasad, S.Ameerjan (Corporate R&D Div., Bharat Heavy Electricals Ltd., Bhopal, India), R.Srinivasan.
Indian J. Cryog., vol.7, no.4, p.184-7 (1982).
Of the many possible large scale applications of superconductivity, applications to superconducting (SC) generators for central power stations are very promising. Such generators will have a rotating SC field winding maintained at about 4K and a normal stationary armature at ambient temperature. Any development work in this application requires solutions to many mechanical and cryogenic problems and hence the work should proceed in stages. As a first step the authors have taken up a programme to develop a rotating helium dewar with transfer coupling. This paper describes the design and fabrication of the system, experimental set up and the performance tests carried out on the system. This work was carried out in collaboration with IIT Madras. (no refs.)

70068 Cryostat for mechanical testing of materials at 4.2K. M.C.Valsakumar, N.Kannan, T.S.Radhakrishnan (Materials Sci. Lab., Reactor Res. Centre, Kalpakkam, India).
Indian J. Cryog., vol.7, no.4, p.188-93 (1982).
A liquid helium cryostat has been fabricated to be coupled to an Instron Model 1195 Universal Testing Machine for mechanical testing of materials at low temperatures. The sample is held between two grip assemblies, the top one being connected to the load cell by a long pull-rod. The bottom grip is connected to a tube, co-axial to the pull-rod, which in turn is attached to the moving cross-head. Studies with this set-up give information about the yield characteristics at room temperature, 77K and at 4.2K. With a manostat, the temperature ranges can be extended to 64-80K and to 1-5K. The effect of magnetic field on yield characteristics especially due to the viscous drag of dislocations by electron cloud can be studied by a 10 kG super-conducting magnet around the sample. (17 refs.)

70069 Solid state helium vapour pressure thermometer. M.J.Mehta, B.K.Basu (Tata Inst. of Fundamental Res., Bombay, India).
Indian J. Cryog., vol.7, no.4, p.200-2 (1982).
This paper describes a solid state helium (He^4) vapour pressure thermometer. The thermometer consists of a pressure transducer, A to D converter, memory and LED display. The standard He^4 vapour pressure temperature scale T_{58} is used. Pressure to temperature conversion is done by the use of solid state memory (lookup table). Main feature of this thermometer is that over full range (i.e. 4.2K to 1K) the accuracy of pressure measurement is better than 1% and resolution of pressure measurement is 1.6 mm Hg from 760 mm to 25 mm Hg and 0.1 mm Hg below 25 mm Hg. Temperature is directly displayed in Kelvin. (2 refs.)

70071 Leak detection of high pressure vessels. S.Bohatka, I.Berecz, G.Horkay, G.Langer (Inst. of Nuclear Res., Hungarian Acad. of Sci., Debrecen, Hungary).
Vacuum (GB), vol.33, no.1-2, p.17-18 (Jan.-Feb. 1983). (Proceedings of the 2nd Joint Meeting of the Roland Eotvos Physical Society (Vacuum Physics and Thin Films Sections) and the Austrian Vacuum Society, Brunn am Gebirge, Austria, 27-29 Oct. 1981).
The most sensitive leak detection method for high pressure vessels is based on the use of a mass spectrometer leak detector. The authors Q6OU type universal quadrupole mass spectrometer was incorporated into the leak test system (type LD-60) designed for the testing of the axial compensators of steam pipings. During manufacture of these items it is possible to detect leak rates ranging from 10^{-9} mbar l s^{-1} and 10^{-7} mbar l s^{-1} with a response time and 5 min of 5 s, respectively, using a combined slow-fast sampling unit and He as the test gas. The leak detector is pumped by an air-cooled, automatically controlled diffusion pump system. (no refs.)

07.50 ELECTRICAL INSTRUMENTS AND TECHNIQUES

70072 A miniature ionisation probe technique using a multilayer circuit board for the study of explosive phenomena in primary and secondary explosives. R.J.Spear, J.R.Bentley, M.G.Wolfson (Materials Res. Labs., Victoria, Australia).
Combust. & Flame (USA), vol.50, no.3, p.249-58 (April 1983).
A miniature ionisation probe technique using a multilayer circuit board has been developed. Full experimental details including construction of the boards, explosive charge preparation, and instrumentation are reported. Each copper layer in the circuit board functions as an ionisation probe and optimum conditions were achieved with a probe density of 15/cm, i.e. probe separation about 0.75 mm. Explosive samples were studied in a geometry similar to that of practical fuse detonators. Accurate, reproducible detonation velocity measurements have been obtained for the primary explosives service lead azide, at a wide range of densities, lead azide RD1343, silver azide and mercuric 5-nitrotetrazole, and the secondary explosive tetryl. (8 refs.)

70073 Designer's notebook [digital multimeter design]. T.Orr.
Electron. Today Int. (GB), vol.11, no.10, p.18-20 (Oct. 1982). [received: May 1983]
The author shows how to use DVM chips go get all the basic ranges of a multimeter. Sufficient information is described to allow the design of a digital multimeter, customised to give exactly the ranges and features most desired. Also discussed are techniques for measuring temperature and dealing with very small signals. (no refs.)

70074 Correct measurement of AC voltages: RMS measurement. P.Tobschall.
Funkschau (Germany), no.8, p.61-4 (15 April 1983). In German.
A general survey of the state of the art, describing and comparing the scope, performance and price of thermal, analog and digital instruments. The treated basic waveforms are sine wave, half-wave rectifier output, sawtooth and square wave. Modern thermoelectric meters make full use of thin film and IC techniques, with operational amplifiers providing automatic balance facilities. Digital meters contain microprocessors and A/D converters, and their speed and resolution decide the accuracy and frequency range of the instrument. Illustrations comprise block diagrams and tables. (no refs.) *A.L.*

70075 The NPL moving-coil ampere determination. B.P.Kibble, R.C.Smith, I.A.Robinson (NPL, Teddington, England).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.141-3 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
The NPL apparatus to realize the SL ampere has a ±1 parts per million (p.p.m.) reproducibility. It employs two rectangular coils of square cross section glued together and connected in series in opposing senses. An uncertainty cannot be given as there is as yet insufficient investigation of systematic errors, but in due course it is expected that 0.1-p.p.m. accuracy can be achieved. (7 refs.)

70076 Realizing the ampere by levitating a superconducting mass—a suggested procedure. B.P.Kibble (NPL, Teddington, England).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.144 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
By observing the current in a superconducting coil required to levitate a superconducting body and, separately, the voltage induced when the body is moved with the current still flowing, the electrical and mechanical units of power can be related to realize the ampere in a way which avoids errors arising from unaccounted dissipative work. (6 refs.)

70077 The maintenance and comparison of standards of electromotive force at the BIPM. T.J.Witt, D.Reymann (Bur. Internat. des Poids et Mesures, Pavillon de Breteuil, Sevres, France).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.260-7 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
Describes improved standard cell comparison equipment, temperature-controlled enclosures, and measurement techniques used to relate reference groups of high-quality standard cells to the BIPM (Bureau International des Poids et Mesures) Josephson-effect standard with an uncertainty of less than 10 nV. This performance is demonstrated by results obtained over four years. The same techniques are now being applied in the routine comparison of international standards of electromotive force by the transfer of standard cells. An analysis of the behavior of the cells that have participated in comparisons lasting 12 years indicates that the uncertainty due to the instability of cells as transfer standards is about 0.5 μV, i.e. one hundred times greater than the best reproducibility in the laboratory. A comprehensive tabulation of uncertainties shows this to be by far the greatest single contribution. (13 refs.)

70078 High-accuracy Josephson potentiometer [voltage standard]. T.Endo (Electrotech. Lab., Ibaraki, Japan), M.Koyanagi, A.Nakamura.
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.267-71 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
A potentiometer with the extremely small relative uncertainty of a few parts in 10^9 has been developed by utilizing the property that a Josephson junction generates a precise voltage that is variable with frequency and step number. The evaluated total uncertainty is 2.5×10^{-9} V for measurements at the 1-V level. This small uncertainty is attributed to the generation of a higher than normal Josephson voltage, that is, on the order of 100 mV. (8 refs.)

70079 The reproduction of the As-maintained unit of voltage at IEN by means of 2*e*/*h*. D.Andreone, E.Arri, V.Lacquaniti, G.Marullo (Istituto Elettrotecnico Nazionale Galileo Ferraris, Torino, Italy).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.272-5 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
The IEN (Istituto Elettrotecnico Nazionale) participates in the joint venture of the national standardizing laboratories which reproduce the as-maintained unit of voltage by means of the fundamental constant $2e/h$. The adopted long-life thermally cyclable Josephson junctions with Nb-base electrodes are described, and the apparatus, procedures, and measurements used to monitor the unit of voltage at IEN are outlined. The results indicate a small positive drift of about 6×10^{-8} per year for V_{IEN-69}; on January 1, 1980 they gave the relation $2e/h=(483\ 594.41\pm0.1)$ GHz/V_{IEN-69}. (12 refs.)

70080 Point-contact Josephson voltage standard. M.Ibuka, S.Naito, T.Furuya (Yokogawa Electric Works Ltd., Tokyo, Japan).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.276-9 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
Describes a practical Josephson voltage standard used to calibrate transfer standard cells. The standard comprises a niobium point-contact Josephson junction—used as the voltage reference—and a series-parallel combination voltage divider. This Josephson junction is robust and withstands temperature cycling between room temperature and 4.2K. The point contact is adjusted at room temperature. The output of the point-contact Josephson junction at 4.2K with a 9.59-GHz microwave signal applied is about 1.9 mV. The divider ratio is 1/529, and divider ratio stability is better than 0.2 ppm/year at room temperature. The point-contact Josephson junction described was compared with the tunnel junction used to determine the Japanese standard volt. The difference between the two was less than 0.5 ppm. (6 refs.)

70081 A device for measuring the electrical potential in an insulator. Yu.P.Gorbachev, K.A.Dergobuzov, V.I.Dovgii, O.B.Evdokimov, A.V.Samoilik, Yu.A.Solov'ev, N.I.Yagushkin (Tomsk Polytech. Inst., Tomsk, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1015-17 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.213-15 (July-Aug. 1982). [received: May 1983]
A device is described for remote measurement of the electrical potential in a specimen exposed to a particle beam. The sign and magnitude of the potential are determined from the change in the number of β particles transmitted by the specimen. Remote potential measurements have been made on three insulating specimens in turn. (2 refs.)

70082 A simple technique for the estimation of the bulk resistivity of powdered materials. J.R.Whyte,Jr. (Res. & Dev. Center, Freeport Minerals Co., Belle Chasse, LA, USA), K.Seshan.
J. Electrochem. Soc. (USA), vol.130, no.4, p.971-4 (April 1983).
A simple technique to accurately measure the bulk resistivity of powdered substances has been developed. It uses a van der Pauw resistivity cell based on four probes arranged on a circle concentric with the edges of a circular compact. The technique provides some structural information as well as electrical properties information about the powder under test. (10 refs.)

70083 Measuring method for electric field ionisation from trapping levels. Y.Hoshino (Yokosuka Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Kanagawa-ken, Japan), K.Arishima.
J. Phys. E (GB), vol.16, no.5, p.427-30 (May 1983).
A technique for measuring electric field ionisation from trapping levels is proposed. The electric field is increased at a constant rate and the current stimulated by the electric field is measured by a personal computer-controlled measuring system. The stimulated current is analysed theoretically under the premise that release from trapping levels is controlled by a mechanism which Poole-Frenkel theory attempts to explain. The experimental technique and analysis are applied to a Cu-phthalocyanine binder photoconductor. (8 refs.)

70084 A field-strength measuring probe for the assessment of personal danger in the neighbourhood of high-power radio transmitters. D.Hoff (Westdeutscher Rundfunk, Koln, Germany), K.-H.Turkner.
NTG-Fachber. (Germany), vol.83, p.97-108 (1983). (Horrundfunk 6 (Sound Broadcasting), Mannheim, Germany, 23-25 Nov. 1982).
The probe has a frequency range of 150 kHz to 30 MHz, and is constructed of a cubical metal casting carrying on its sides three dipoles, perpendicular to each other, for the measurement of electric field-strength, and three loop antennae, perpendicular to each other, for magnetic field-strength measurements. The overall diameter of the probe is 30 cm. The antennae are connected through amplifier stages to a thermo-converter activating the indicating equipment. (8 refs.) *A.G.P.*

70085 Dielectric permittivity measurements in the ultralow frequency region. S.Takeishi, R.Nozaki, S.Yagihara, S.Mashimo (Dept. of Phys., Faculty of Sci., Tokai Univ., Kanagawa, Japan).
Rev. Sci. Instrum. (USA), vol.54, no.5, p.639-40 (May 1983).
A new DC transient method is described for fast measurements of dielectric permittivity in the μHz frequency region. A square-wave voltage pulse is applied to the dielectric instead of the usual step voltage pulse. The whole transient current is measured two times faster than in the conventional method using the step voltage. (3 refs.)

70086 High-resolution probing of surface-charge distributions on corona- and friction-charged teflon FEP foils. R.Gerhard-Multhaupt (Inst. for Electroacoustics, Tech. Univ. Darmstadt, Darmstadt, Germany).
Electrostatics 1983. Sixth Conference on Electrostatic Phenomena, Oxford, England, 13-15 April 1983 (Bristol, England: IOP 1983), p.111-16
An apparatus for measuring surface-charge distributions on high-polymer electret foils has been constructed. The device can measure surface potentials of up to 1.4 kV with a lateral resolution of about 100 μm. It is employed to investigate the surface-charge variations caused by the control grid in corona-charging experiments. In addition, surface-charge patterns on Teflon FEP electrets charged by means of a triboelectric charging apparatus are reported. (8 refs.)

70087 A new conductivity gauge for antistatic films. A.R.Blythe (Petrochem. & Plastics Div., ICI, Welwyn Garden City, England).
Electrostatics 1983. Sixth Conference on Electrostatic Phenomena, Oxford, England, 13-15 April 1983 (Bristol, England: IOP 1983), p.117-22
In making antistatic films it is important to be able to monitor the surface conductivity during the production process. Typical products have, however, a relatively low surface conductivity, in the range 1 to 1000 pS, making measurements rather difficult. This paper describes a novel method to gauge the level of surface conductivity continuously on a moving, antistatic web, using an entirely non-contacting probe. The system relies on observing an induced charge distribution by means of an electric field meter. A version which scans a web laterally has been developed and has been used successfully at film line-speed above 1 m/s. (4 refs.)

70088 The Josephson effect measures very weak magnetic fields. T.D.Clark, R.J.Prance (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).
Elektrotechnik (Germany), vol.65, no.7, p.24-7 (7 April 1983). In German.
The basic physics of the Josephson element, as used in the 'weakly-coupled SQUID ring' magnetometer, is outlined. Possibilities for the further development of the technique for measuring extremely weak magnetic fluxes, are discussed. (4 refs.) *F.Q.*

70089 Standard magnetic field radiated by two loop antennas in a coplane. H.Nakane (Dept. of Electrical Engng., Sci. Univ. of Tokyo, Tokyo, Japan), S.Obuki, S.Omori, I.Yokoshima.
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.238-40 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
A RF magnetic field generator consisting of two radiating loop antennas placed in a coplane is proposed, which has relatively uniform field distribution and permits easy alignment of the antennas. A standard field generator based on this idea, having flat frequency characteristics up to 30 MHz, has been designed and tested. It was confirmed that misalignment of the receiving antenna up to 2 cm, for a distance of 30 cm between the radiating loop and the test point, causes an error of only ±0.1 dB. In terms of frequency characteristics, the field strength at the test point was flat within ±0.15 dB from 1 to 30 MHz. (6 refs.)

70090 Attachment to the Shl-1 magnetic-induction meter for displaying the result in magnetic-induction units. V.I.Barchuk (Semiconductor Inst., Acad. of Sci., Kiev, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.996-7 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.195-6 (July-Aug. 1982). [received: May 1983]
An attachment to the Shl-1 magnetic-induction meter is described for use with a Ch3-34A electronic counting frequency meter to display the results in units of magnetic induction. The error of 2×10^{-7} introduced by the attachment is much less than the error of measurement of the Shl-1. (3 refs.)

07.58 MAGNETIC RESONANCE SPECTROMETERS, AUXILIARY INSTRUMENTS AND TECHNIQUES

(see also 61.16N EPR and NMR determinations)

70091 Field stabilizer for permanent magnet of nuclear magnetic resonance spectrometer. G.V.Ivanov, D.I.Vainshtein, V.A.Safin, V.D.Shchepkin.
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.967-8 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.168-9 (July-Aug. 1982). [received: May 1983]
Describes a current stabilizer for creating the supplementary field (0.035 T) to the permanent magnet and compensating its temperature-induced drift. The stability of the resulting field is 1.2×10^{-5}/h or greater. (4 refs.)

70092 Cross polarization magic-angle spinning NMR at cryogenic temperatures. V.Macho, R.Kendrick, C.S.Yannoni (IBM Res. Lab., San Jose, CA, USA).
J. Magn. Resonance (USA), vol.52, no.3, p.450-6 (May 1983).
A magic angle spinning (MAS) apparatus which can be used for high resolution solid state NMR at temperatures as low as 15K is described. To demonstrate the utility of this apparatus, ^{13}C spectra of molecules containing methyl groups have been investigated at cryogenic temperatures. The spectra, which are described in detail, provide direct evidence for the slowdown of methyl rotation. (15 refs.)

70093 A high sensitivity toroid detector for ^{17}O NMR. T.E.Glass, H.C.Dorn (Dept. of Chem., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
J. Magn. Resonance (USA), vol.52, no.3, p.518-22 (May 1983).
The low natural abundance (0.037%) and modest nuclear moment for the ^{17}O nuclide have until recently severely restricted ^{17}O NMR studies. In addition, the quadrupole ($I={}^5/_2$) dominated relaxation mechanism and corresponding short T_1 and T_2 relaxation times typically yield ^{17}O NMR spectra with linewidths of 10 Hz-1 kHz. The authors study the S/N advantage of the toroid configuration for ^{17}O NMR studies in comparison with the commonly employed Helmholtz coil design. (8 refs.)

70094 Possibility of carrying out field-free paramagnetic resonance by the two-frequency method. N.I.Deryugina, A.B.Roitsin (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1783-4 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3147-9 (Oct. 1982). [received: April 1983]
By virtue of the specific characteristics of multiquantum transitions (narrow lines, additional selection rules, etc.) the information provided by the investigations and the potentialities of practical applications are increased substantially. The authors consider the possibility of using two-photon transitions to effect paramagnetic resonance in a zero magnetic field (field-free resonance). (17 refs.)

70095 The evolving problems in precise optical measurements. L.M.Biberman (Inst. for Defense Analyses, Alexandria, VA, USA).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.217-52 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
Discusses problems associated with the development of high accuracy standards coupled with the basic practicality of producing the tools for the working scientist or engineer. (8 refs.)

70096 Optical-transmittance measurement method in the FOCA2 experiment. F.Falciglia (Istituto di Fisica, Univ. di Catania, Catania, Italy), A.Garuccio, G.Iaci, L.Pappalardo.
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.2, p.66-70 (14 May 1983).
A method for measuring optical transmittance of calcites in condition similar to those of experiments involving single-photon techniques is described. The use of a pulsed-light source together with a coincidence technique yields high signal-to-noise ratio, so allowing a more accurate valuing of the parameters of interest. (5 refs.)

70097 Theory of azimuthal compensator for white light. F.Ratajczyk (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.3-4, p.395-401 (1982).
A possibility of employing an azimuthal compensator to measurements of small local wavefront deformation as well as optical path difference occurring due to birefringence in white light have been presented. There, it was stated previously by the author (see ibid., vol.11, p.483, 1981) that this method had been verified experimentally but neither its validity was proved mathematically nor its range of applicability established. Both these problems are the subject of this work. (2 refs.)

(inc. colorimetry; see also 07.62 Detection of radiation)

70098 Notes on the method of fluorescence and phosphorescence measurements—by the use of Hitachi MPF 4 fluorescence spectrophotometer. T.Moriya (Electrotech. Lab., Ibaraki, Japan).
Bull. Electrotech. Lab. (Japan), vol.47, no.2, p.81-8 (1983).
Points out that in the standard fluorescence and phosphorescence spectrophotometer the measurement geometry as well as the components of the system must be carefully chosen in accordance with characters of the fluorescing samples. The right angle arrangement for fluorescence measurements are examined theoretically and the experimental data on the calibration curve of the detected fluorescence intensity versus the absorbed excitation light shown. The theory explains very well the experimental results. (11 refs.)

70099 Light measurement many ways. J.Kelley, C.P.Comeau (Internat. Light Inc., Newburyport, MA, USA).
Photonics Spectra (USA), vol.17, no.3, p.52-6 (March 1983).
Provides a general description of some of the major application areas and of corresponding instrumentation characteristics, followed by consideration of three of the newer areas—solar power and energy measurement, photochemical etching and ultraviolet curing—that increasingly require such instrumentation. The measurement instrumentation considered includes:- radiometers and photometers; laser power and energy meters; fiber optic radiometers; and spectroradiometers. (no refs.)

70100 Calculation of the luminous flux of a point source of light to a rectangular surface. J.Habel.
Elektrotech. Obz. (Czechoslovakia), vol.72, no.4, p.188-95 (April 1983). In Czech.
The article contains deduced relations for the calculation of the luminous flux from a rotationally symmetric radiating point source to a rectangle which lies either on the plane perpendicular to a chosen direction of relative luminous intensity or in a plane parallel to a chosen direction of luminous intensity. The curve given by the plane section of the photometric surface of luminous intensity is described by the characteristic function of this intensity in the form $f_1(\alpha)=\cos^n \alpha$, where $n=0, 1, 2, ..., 5$. Examples of designed graphical aids are presented to help the solution of deduced relations. The considerations are supplemented by an example showing how to proceed by practical calculations. (5 refs.)

70101 Small cryostat for cooling a photomultiplier. A.A.Samokhvalov, Yu.P.Sukhorukov, A.F.Gunichev (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1039-40 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.234 (July-Aug. 1982). [received: May 1983]
A simple cryostat is described for cooling end-window photomultipliers with liquid-nitrogen vapor, making it possible to regulate the temperature of the photomultiplier photocathode from room temperature to −100°C. The use of the cryostat increases the S/N ratio of the photomultiplier by a factor of 20 in the photon-V counting technique. (2 refs.)

70102 Problems on luminance measurement and calibration of luminance meter. Y.Mishima (Illuminating Engng. Inst. of Japan, Tokyo, Japan).
J. Illum. Eng. Inst. Jpn. (Japan), vol.67, no.1, p.15-17 (Jan. 1983). In Japanese.
In brightness measurement, care should be taken to set up a brightness meter for conditions under which: (1) rays of light incident upon the light-receiving surface of the meter will be direct from the subject surface without reflection, and (2) the relative spectral-sensitivity of the meter will be closest to the standard relative-visibility. A light-diffusion plate capable of providing a uniform brightness and a light distribution in cosine law should be used in brightness-meter calibration. These are discussed. (8 refs.) *K.B.*

70103 More about the interference colours. F.Ratajczyk (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.3-4, p.379-93 (1982).
In the physics textbook or professional literature many controversial opinions may be found as to the possibility of measuring optical path differences with the aid of interference or pseudointerference polariscope colours. These controversies are mainly due to the acceptance of some incorrect assumptions. The author looks at the possibility of applying the interference and polariscope colours to the real conditions of measurement as a measure of optical path difference. (3 refs.)

70104 Measuring small AC Faraday rotation: a novel method. R.M.Duffy, R.P.Netterfield (CSIRO Div. of Appl. Phys., Lindfield, Australia).
Appl. Opt. (USA), vol.22, no.9, p.1272-3 (1 May 1983).
An essential requirement in ellipsometry and polarimetry is accurate setting of crossed polarizers. Visual or electronic detection of the null is not very accurate. Increased sensitivity is obtained by angular modulation of the plane of polarization between the polarizers and detection of the light flux at the frequency of modulation using a lock-in amplifier. At the true null setting, the amplitude of the detected signal is zero and the phase changes sign. It has been shown that the amplitude of the angular modulation angle has an optimum value depending on the fraction of depolarized light passing through the system and the importance assigned to angular resolution, wavelength resolution, and speed of response. For these reasons and also to obtain consistent sensitivity of setting, the modulation amplitude should be known. A method of measurement is suggested which uses electronic detecting equipment which is commonly available with nulling type ellipsometers. (2 refs.)

70105 Modulation error in determining polarization azimuth. S.A.Alekseev, V.T.Prokopenko.
Meas. Tech. (USA), vol.25, no.8, p.645-7 (Aug. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.8, p.23-4 (Aug. 1982). [received: April 1983]
Modulation null ellipsometry employs the Faraday effect and has a sensitivity in polarization azimuth measurement of 0.0002°. One of the features of systems employing this principle is the modulation error. The authors have found that there are phase shifts in the optical components between the modulator and analyzer which result in a modulation component of the systematic error, whose value is comparable with or even larger than the change in state of polarization in these elements. An analysis of this error and its experimental verification are described. (4 refs.)

07.60H Refractometry and reflectometry

70106 Methods of measuring the profile of the refractive index of optical fibres. J.Holoubek.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.3, p.65-8 (March 1983). In Czech.
For previous part see ibid., no.2, p.47 (1983). The following methods which can be used for measuring multi-mode fibres are described: transmission (near-field) methods; scattering methods; a focusing method; and a fluorescent method. Methods which are suitable for determining the refractive index of single-mode fibres are surveyed. (46 refs.) *E.D.*

70107 Changes of refractive index in glass induced by UV-irradiation and a new possibility of their determination. S.Gebala, I.Wilk (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.3-4, p.483-8 (1982).
Indicates the possibility of measuring the small changes in refractive index provided that they are of a periodic nature. (4 refs.)

70108 Differential reflectometry and its application to the study of alloys, ordering, corrosion, and surface properties. R.E.Hummel (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA).
Phys. Status Solidi a (Germany), vol.76, no.1, p.11-44 (16 March 1983).
Differential reflectrometry is a surface analytical technique. It uses ultraviolet, visible, and infrared light as a probing medium. The interaction of light with 'strong absorbing materials', such as metals, occurs in the first hundred to two hundred Angstrom units. Thus, the differential reflectometer probes fifty to one hundred atomic layers into non-transparent solid surfaces. The author describes the differential reflectometer and its applications to problems in materials science and solid state physics. It also reviews pertinent results obtained with this instrument. (88 refs.)

70109 Standing wave sensor. E.W.Silvertooth, S.F.Jacobs.
Appl. Opt. (USA), vol.22, no.9, p.1274-5 (1 May 1983).
Describes the performance of a one-beam interferometer or standing wave sensor, which is a photoelectric analog of Wiener's photographic sensor of the standing waves produced when light reflects from a mirror. As Wiener showed, when a collimated monochromatic light beam reflects off a plane mirror there are planes of nodes (and antinodes) spatially positioned at half-wavelength intervals when the beam is normal to the mirror. A photocathode can sense their relative spacing as either the mirror or photocathode is translated perpendicular to these planes. The sensitivity of this device depends on the thickness of the effective photosensing surface, and the authors have found this to be very small compared to the wavelength of light. The photoelectric sensor consists of a photomultiplier tube comprised of two optically flat end windows, with a 500-Å thick semitransparent photocathode deposited on the inner surface of one window. The tube also contains a six-stage annular dynode assembly such that a collimated laser beam can pass through the tube and be returned by mirror, thus setting a standing wave. (2 refs.)

70110 Phenomenon of the double-feedback F-P optical oscillation. Li Yung-gui, Zhang Hong-jun (Inst. of Phys., Acad. Sinica, Beijing, China).
Acta Phys. Sin. (China), vol.32, no.3, p.309-14 (March 1983). In Chinese.
English translation in: *Chin. J. Phys. (USA)*
The F-P passive optical oscillator with two feedback circuits is described. This oscillator transforms an input with continuous intensity of light into multivibrating optical pulses or optical sinusoidal signal output. The principle of oscillation is analysed. The experimental results in agreement with the analysis are presented. (8 refs.)

70111 Device for observing microheterogeneities in interference coatings. E.I.Firsov, P.G.Shlyakhtenko (Leningrad Inst. of Textile & Light Industry, Leningrad, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1028-9 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.225 (July-Aug. 1982). [received: May 1983]
With a view to increasing the contrast in investigations of heterogeneities in interference coatings in the Linnik interferometer, the authors propose that a monochromator, tunable to the wavelength at which reflection of light from the coating is minimum, to be used as the illuminator. (8 refs.)

07.62 DETECTION OF RADIATION (BOLOMETERS, PHOTOELECTRIC CELLS, I.R. AND SUBMILLIMETRE WAVES DETECTION)

70112 Rapid temperature variation of hopping conduction in GaAs low-temperature bolometers. J.K.Wigmore, B.Tlhabologang (Dept. of Phys., Univ. of Lancaster, Lancaster, England).
Appl. Phys. Lett. (USA), vol.42, no.8, p.685-7 (15 April 1983).
The very rapid temperature dependence between 1 and 4K of the resistivity of GaAs bolometers was found to follow $\rho \sim \exp(AT^{-1/4})$. The most plausible attribution of this behavior was to variable range, single particle, and the data were consistent with the model of Apsley and Hughes. (14 refs.)

70113 Invisible—yet seen. Nocturnal vision equipments for the near-infrared range. K.Brun (Military Sci., ETH Zurich, Zurich, Switzerland).
Funkschau (Germany), no.7, p.53-6 (31 March 1983). In German.
Presents a survey of passive and active IR sighting instruments, illustrated by 8 diagrams/drawings. After dealing with the spectra and windows in the visible and adjacent IR ranges and the relevant atmospheric attenuation, various shortwave IR instruments (0.7 to 1.5 μm band) and thermal-imaging devices in the far IR band (3 to 15 μm) are described. A more detailed treatment of an active nocturnal sight equipment follows; it utilizes an IR searchlight and the photoemission (external) effect to obtain a visible image of the reflection at the eyepiece of an image converter tube. A passive instrument is described next, containing a 3-stage photo-multiplier with fibre optics input-, intrastage coupling- and output lenses. A more advanced converter tube contains a secondary electron multiplier/amplifier and separate tubular micro-channels; it requires 5-8 kV. Brief information is supplied on thermal-imaging devices, using the photoconductive (inner) effect for target detection in the air and on the ground. (no refs.) *A.L.*

70114 Pyroelectric radiation detectors. Y.Nakagawa (Illuminating Engng. Inst. of Japan, Tokyo, Japan).
J. Illum. Eng. Inst. Jpn. (Japan), vol.67, no.1, p.9-12 (Jan. 1983). In Japanese.
Optical detectors based on the pyroelectric effect are commercially available. Typical pyroelectric materials used as an optical sensor element are TGS, $PbTiO_3$, $LiTaO_3$, PZT and PVF_2. TGS and $LiTaO_3$ are suitable for point sensors. PZT and $PbTiO_3$ are stable at high temperatures. The author describes the equivalent circuit and frequency response of sensors and illustrates typical sensor structures and detection circuits. Examples are given of a light emission detector, infrared detector and infrared visicon. (13 refs.) *K.B.*

07.65 OPTICAL SPECTROSCOPY AND SPECTROMETERS

(inc. photoacoustic spectroscopy)

70115 Photoacoustic spectroscopy in crystalline semiconductors. H.Tokumoto (Electrotech. Lab., Ibaraki, Japan).
Bull. Electrotech. Lab. (Japan), vol.47, no.2, p.97-108 (1983). In Japanese.
See also ibid., vol.47, no.2, p.109-21 (1983). Photoacoustic measurements were made on single crystals of Si, Ge, InSb, GaAs and GaP by a gas-microphone method. Extensive measurements were made on GaAs samples, laying emphasis on the effects of the sample thickness, damaged surface layer, impurity concentration and thermal resistance at the sample gas interface on the photoacoustic signals. A successful interpretation of the overall experimental results with the aid of Resencwaig-Gersho theory indicates a possible application of photoacoustic spectroscopy to characterization of semiconductors. (19 refs.)

70116 Theory of photoacoustic spectroscopy in solids—gas-microphone method. H.Tokumoto (Electrotech. Lab., Ibaraki, Japan).
Bull. Electrotech. Lab. (Japan), vol.47, no.2, p.109-21 (1983). In Japanese.
Theoretical and quantitative treatment of photoacoustic effects orginating from internal heating as a result of light absorption was made for application of photoacoustic spectroscopy in determining the thermal and optical properties of solids. The most fundamental and widely-used theory by Rosencwaig and Gersho and its calculated results are shown. The characteristic signals detected by a gas-microphone method are described. Effects of the thermal resistance at the sample-gas interface, the mechanical vibration of the sample, and the layered structure of the sample are also discussed. (43 refs.)

70117 Picosecond streak camera fluorometry. A review. A.J.Campillo (Optical Sci. Div., US Naval Res. Lab., Washington, DC, USA), S.L.Shapiro.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.585-603 (April 1983).
A general tutorial survey is presented describing the use of ultrafast streak cameras in picosecond fluorometry. Current instruments exhibit time resolutions of 1-10 ps with detection sensitivities of a few photoelectrons. When linear photoelectric recording is employed, a real-time direct display of optical transients is provided. Representative examples from the literature in physics, chemistry, and biology are given, as well as an extensive bibliography. (155 refs.)

70118 A semiconductor detector for measuring ultraweak fluorescence decays with 70 ps FWHM resolution. S.Cova, A.Longoni (Istituto di Fisica, Politecnico di Milano, Milano, Italy), A.Andreoni, R.Cubeddu.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.630-4 (April 1983).
The performance of a new single-photon avalanche photodiode particularly suitable for the detection of fast and ultraweak light pulses is described. The advantages of this device over other available detectors are discussed. The electronic circuitry developed allows the measurement of fluorescence decays with a time resolution of 70 ps FWHM (full-width at half-maximum) and a data acquisition rate of up to 50 kHz. (21 refs.)

70119 Measurement conditions for continuously recording picosecond pump-and-probe spectrometers. T.Damm, W.Triebel, B.Wilhelmi (Dept. of Phys., Friedrich-Schiller Univ., Jena, Germany).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.635-8 (April 1983).
The measuring procedure of continuously recording picosecond pump-and-probe spectrometers is analyzed. The distortion of the input signal because of the finite pulse duration of probe pulses and because of the impulse response of the recording device is calculated. The influence of fluctuations of the output parameters of mode-locked dye lasers on the accuracy of measurements is considered. Measuring conditions such as choice of scan velocity and characteristic time of low-pass filters are discussed with respect to the condition that the resulting error should be a minimum. (7 refs.)

70120 Pulsed source of an optical comparison spectrum of high brightness. V.P.Novikov, V.S.Smirnov (Physicotech. Low-Temperature Inst., Acad. of Sci., Khar'kov, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1006-7 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.204-5 (July-Aug. 1982). [received: May 1983]
Describes a source of an optical comparison spectrum of increased brightness; the source makes use of a stable iron Pfund arc in pulsed operation. (4 refs.)

70121 Scanning mirror device with frequency matching for the DFS-13 spectrograph. V.P.Novikov, V.S.Smirnov, V.V.Eremenko (Physicotech. Inst. of Low Temperature, Acad. of Sci., Khar'kov, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1011-15 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.209-12 (July-Aug. 1982). [received: May 1983]
Describes a scanning mirror device incorporated in the DFS-13 spectrograph for photoelectric recording of spectral sections of ~40 mm in the focal plane of the instrument (~80 and ~160 Å for gratings of 1200 and 600 lines/mm, respectively). The scanning time is 60 μsec. Together with two adjustable frequency marks outputted by the device, the spectrum is recorded on an oscilloscope screen. (2 refs.)

70122 Photoacoustic spectroscopy. T.Ishiguro (Electrotech. Lab., Ibaraki, Japan).
J. Inst. Electron. & Commun. Eng. Jpn. (Japan), vol.66, no.1, p.27-32 (Jan. 1983). In Japanese.
Photoacoustic spectroscopy is a spectroscopic technique which illuminates a solid or semisolid material sample with monochromatic radiation intensity modulated at some suitable acoustic frequency; absorption of radiation results in a periodic heat flow from the sample, which generates sound that directly relates to absorption of radiation and is detected by a sensitive microphone. This paper outlines practice for photoacoustic spectroscopy, and its application to evaluating semiconductor materials and to photoacoustic microscopes. (16 refs.) *K.B.*

70123 Statistical estimates of spectroscopic parameters in multichannel detection of weak optical spectra. S.L.Nitsolov (Inst. of Electronics, Bulgarian Acad. of Sci., Sofia, Bulgaria).
Bulg. J. Phys. (Bulgaria), vol.10, no.1, p.78-86 (1983).
Optimum statistical estimates of spectroscopic parameters measured by analysis of weak optical spectra detected by a multichannel photodetector have been obtained. The likelihood equations have been derived for the estimates in cases where the spectral intensity is a known function of the measured quantity and where the dependence of the spectral form on the unknown parameter is known. When the noise is considerably weaker than the signal, approximations for the maximum likelihood estimates may be used, the approximations being of fair accuracy and easy to calculate. As an illustration of the applications of the results estimates are made of gas concentrations measured by a Raman lidar. The results obtained here may be used to optimize the processing of spectroscopic data in multichannel detection. (6 refs.)

70124 Picosecond spectrochronography. A.Freiberg, P.Saari (Inst. of Phys., Acad. of Sci., Tartu, Estonian SSR).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.622-30 (April 1983).
The general problem of extracting complete (amplitude and phase) information out of an optical signal is discussed. It is shown that the best one can do to determine all essential features of light pulses is to apply simultaneous temporal and spectral analysis to take spectrochronograms with the appropriate shape of the resolution cell on the ωt-plane. The term 'spectrochronogram' is used instead of the much broader term 'time-resolved spectrum' for a specific measurement result where the resolutions $\Delta\omega$ and Δt used are transform correlated. A novel subtractive mount of monochromators has been proposed to overcome the obstacles to experimental realization of uncertainty-principle-limited setups for high spectral resolution picosecond spectrochronography. For the examples of perylene and anthracene molecules, experimental spectrochronograms revealing temporal behavior of hot luminescence lines and, correspondingly, picosecond kinetics of intramolecular vibrational relaxation have been presented. (29 refs.)

70125 Unified supply source for lamps used in ultraviolet spectroscopy. R.R.Vardapetyan, S.A.Terzikyan, P.O.Vardevanyan, G.A.Panosyan (Erevan State Univ., Erevan, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.968-70 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.170-1 (July-Aug. 1982). [received: May 1983]
A miniature economical source of light is described for use in lamps employed in UV spectroscopy, with stabilized anode and heater currents. The instability of the output current is $\leq 0.5\%$ with variations in supply voltage of $\pm 10\%$ and temperatures from 10 to 40°C. The dimensions of the unit are $180 \times 150 \times 150$ mm. 70126 Branch-selected infrared laser ring cavity for ultrahigh resolution spectroscopy. Huang Yong-kai (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.1, p.159-61 (Jan.-March 1983). [received: May 1983]
A simple method of branch selection is suggested and the beam parameters for the cavity are calculated. (7 refs.)

70127 A new approach to infrared spectroscopy. J.F.Williams (Perkin-Elmer, Ridgefield, CT, USA).
Photonics Spectra (USA), vol.17, no.3, p.59-62 (March 1983).
Probably the single most important advantage of Fourier transform infrared spectroscopy (FT-IR) is its high rate of data collection. In fact, the spectroscopist now has at his disposal user-interactive data systems and related software capable of further boosting the quality of FT-IR analysis. This speed advantage affords the analyst heretofore unequalled measurement capabilities in the areas of signal accumulation and averaging on micro samples, fast reaction kinetics, high sample throughput in the quality control environment, and on-the-fly detection of gas chromatography separations. The author examines one particular type of FT-IR system—the refractively scanned interferometer. The Perkin-Elmer model 1500 FT-IR is used as the example for this examination. Dual-beam operation and the advantages of a HgCdTe detector are discussed. (no refs.)

70128 Spectrograph for investigating spectra of pulsed infrared lasers. G.B.Gorlin, I.I.Komissarova, G.V.Ostrovskaya, Yu.I.Ostrovskii, L.G.Paritskii, V.N.Filippov, E.N.Shedova (Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1009-11 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.207-8 (July-Aug. 1982). [received: May 1983]
Describes a spectrograph for the photographic recording of pulsed infrared radiation spectra at wavelengths exceeding the sensitivity range of conventional photographic materials. The spectrograph was assembled in the standard configuration with mirror optics (f=60 cm) and a diffraction grating (50 lines/mm). For the recording, photographic material was illuminated by a pulsed source of actinic radiation, the source being synchronized with the infrared radiation source to be examined so that a thermal relief is produced on the photographic material. The recording sensitivity is 10^{-2} J/cm^2. The spectra of a pulsed CO_2 laser with a double transverse discharge were obtained in the spectrograph. (5 refs.)

70129 Spectral resolution of a proustite upconverter as an infrared spectrometer. K.Koyanagi, I.Sakuraba (Faculty of Engng., Hokkaido Univ., Sapporo, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.2, p.163-4 (Feb. 1983). In Japanese.
The spectral resolutions of an upconverter-spectrometer in the 10 μm spectral region, using a proustite crystal and a Nd:YAG laser as the pump, are described. The resolving power ($\lambda_{ir}/\Delta\lambda_{ir}$) of 2.2×10^2 is obtained for a 9.4 mm length crystal. (4 refs.)

(for light sensitive materials see also 42.70)

70130 3M colour reversal 1000—a review. G.Ashton.
Br. J. Photogr. (GB), vol.130, no.17, p.445-5, 459 (29 April 1983).
3M Colour Reversal 1000 film is balanced for exposure in daylight with a nominal colour temperature of 5500K and is thus suitable for existing light photography where the primary source of illumination is daylight. Both sensitometric and camera exposures were made on Colour Reversal 100 film in testing and to provide a datum line for speed and colour balance, similar exposures were made on the nearest comparison material from another manufacturer—Ektachrome 400. The characteristic curves for 3M Colour Reversal 1000 film plotted from sensitometric exposures show good or even excellent conformity with only a slight difference in the contrast of the toe of the blue-sensitive emulsion to contradict this general statement. Judged on the neutral grey scale of the Macbeth ColorChecker both the 3M Colour Reversal 1000 and the Kodak Ektachrome 400 films show a very similar neutral balance—the 3M film with slightly bluish highlights and the Kodak film slightly greenish highlights; neither is excessive nor objectionable. When transparencies made on 3M Colour Reversal 1000 film are projected to a reasonable size and viewed from a comfortable distance for the screen dimensions the graininess of the image is just perceptible. Examination of the sharpness of the 3M film by assessment of the high contrast resolving power chart on projection demonstrates that the manufacturers' claim for high sharpness is justified and for its speed Colour Reversal 1000 film is very crisp. (no refs.)

70131 Kodacolor VR 1000 film. H.Denstman.
Ind. Photogr. (USA), vol.32, no.2, p.22, 24, 49 (Feb. 1983).
Reports the development of a new high-speed negative color film—Kodacolor VR-1000, which represents a dramatic advance in silver-halide emulsion technology. Kodak's new film represents a radical departure in grain structure, for compared with conventional high-speed silver-halide emulsions which contain relatively large, irregularly shaped light-sensitive silver salts, Kodacolor 1000 employ, a 'smooth' tablet shaped silver-halide grain that appears to be flat. The new grains maximise the absorption of incoming light resulting in a more sensitive imaging medium without any increase in silver content. The tablet shaped 'T-grain' offers greater light sensitivity with better sharpness than was previously possible and the flattened grain results in a more light-sensitive emulsion without a difference in graininess. The new film technology has also made it possible to eliminate the interdependence between speed grain and sharpness, which has in the past accompanied improvements in one area with penalties in one or both of the others. Other advances incorporated in the film include improved coupler/image dye technology and use of a modified inverted layer format is a configuration in which the fastest light-sensitive layers are positioned nearer to the camera lens, followed by the slower layers. (no refs.)

70132 Optical effects for film and video. J.Manilla.
Ind. Photogr. (USA), vol.32, no.2, p.27-9 (Feb. 1983).
Outlines the techniques available for producing optical effects for the video and film industries. For the video industry these range from the Digital Production Effect 5000 series video effects generator, which allows the operator to manipulate the picture on the screen in real-time, through simply using 'joy stick' and push button controls, thus enabling him to see exactly what is happening on the screen, through to the latest Mirage system, which can now take a flat two-dimensional picture and electronically convert it into a three-dimensional image. With the film industry, because of the requirements for film exposure, development and printing, one loses the real-time facility of the video generator and the motion picture optical effects are produced by a number of stages, which lead to the production of computer-generated drawings which are photographed on film, and the colours are added and controlled by color filters. With film one is working with a chromatic range which is superior to the limited range that video can generate and this enables one to get a better chromatic range and more subtle colours. Also the possibilty of 'multiple runs' on the same piece of film, enable one to achieve very complicated and precise 'matched' moves. (no refs.)

70133 PVCz/HgS double layer structure for electrophotography. Navneet, P.K.C.Pillai (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
J. Mater. Sci. (GB), vol.18, no.5, p.1577-81 (May 1983).
Xerographic characteristics of the double layer structure PVCz/HgS have been evaluated. These characteristics for the double layer have been compared with those for the single layer of HgS pigment and acrylonitrile-butadiene-styrene resin. Acceptance potential, fractional dark and photoinduced decrease, contrast potential, and relative spectral sensitivity are the most important characteristics studied. The double layer shows a maximum surface potential of 1632 V and 93% fractional decay of surface potential under illumination (intensity being 8.5 mW cm^{-2}), calculated 10 sec after the start of illumination. The spectral sensitivity is nearly panchromatic from 460 to 530 nm with a sensitivity peak at 585 nm in the visible region. (17 refs.)

70134 Using the video signal to control the intensity of the illumination for an endoscope video camera. J.Kullmann, H.Hartig (VEB Werk fur Fernsehelektronik, Berlin, Germany).
Radio Fernsehen Elektron. (Germany), vol.32, no.2, p.73-5 (1983). In German.
The authors explain that the inside of the object to be photographed has to be illuminated from an aperture, via a light conducting cable, connected close to the endoscope aperture. Because the endoscope is moved during the video recording process, the illumination of an area to be recorded can be insufficient. After explaining how illumination was controlled when using Videcon cameras, the authors describe a much more efficient 'hybridendikon' camera, which, however, requires that the illumination of the object to be examined must be differently controlled. The video signal amplitude is increased and decreased as the illumination provided becomes dimmer and brighter. Rectification of this signal with an appropriate time constant produces a control voltage proportional to the intensity of the illumination required. By reversing the phase of the signal in the control circuit, an increasing illumination will cause the voltage controlling the illuminating light to be reduced and vice versa. The article describes in detail the circuit used and discusses practical applications of it. (2 refs.) *G.W.*

70135 Enzymatic photography. I.V.Berezine, N.F.Kazanskaya (Inst. of Biochem., Acad. of Sci., USSR).
Recherche (France), vol.14, no.144, p.708-10 (May 1983). In French.
Photography itself is in the course of changing. Research on new photosensitive supports gives rise to the hope that photography using silver salts may be replaced by enzymatic photography. This will both reduce costs and conserve

silver. The paper describes recent work in Russia on the actions of enzymes on film. The production of substratae which are light sensitive is first described. Then follows a description of the transition from rendering a film photosensitive to enzymes to the production of an image. The process of fixing the enzymes after taking a picture is explained, the film used being a sandwich of three layers. The last section discusses whether enzymatic photography has now arrived to stay. (14 refs.) *G.V.D.*

70136 A new method of magnifying photographic images using the scanning electron microscope in the backscattered electron detection mode. P.Frasca (Dept. of Orthopaedic Surgery, Thomas Jefferson Univ., Philadelphia, PA, USA), B.Galkin, S.Feig, H.Muir, R.Soriano, H.Kaufman.
Scanning Electron Microsc. (USA), pt.3, p.917-23 (1982).
Describes a new method of magnifying small images in photographic film by means of a scanning electron microscope (SEM) operated in the backscattered electron detection mode. The study included tests of several types of radiographic film, transmission electron microscopy film, and black and white 35 mm film. The electron optical enlargement method is particularly useful in situations where the film sample is opaque to light and for generating enlarged images at magnifications beyond the reach of light optical enlargement methods, i.e. up to ~2000×, with ease and rapidity in a single step. The electron optical enlargements compare favorably in contrast and detail with the enlargements made with a light microscope and with a darkroom enlarger. (7 refs.)

07.75 MASS SPECTROMETERS AND MASS SPECTROMETRY TECHNIQUES

(for mass spectroscopic chemical analysis, see 82.80)

70137 A very sensitive electro-optical simultaneous ion detection system. G.J.Louter, A.N.Buijserd (FOM-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.50, no.3, p.245-57 (15 May 1983).
A fully operational, electro-optical system for simultaneous detection is discussed. This system is applied to the simultaneous detection of mass spectra, obtained by collision-activated dissociation experiments. The detector itself consists of a chevron arrangement of two channel plates, phosphor screen, fibre optics, camera objective and photodiode array. It forms part of an extensive information system, which controls the photodiode array and performs data processing as, for example, background subtraction and correction of the spectrum for spatial sensitivity variations of the detector. The detection system is characterized by a very low noise rate with an average value of about one dark ion per 250 s for each mass peak in the spectrum. The dynamic range of peak heights in a simultaneously detected spectrum can be up to 3.3×10^4 at a signal to noise ratio of 1. The reproducibility of peak area measurements is better than 20% over the entire length of the detector. Several characteristics of the detection system and the data processing is discussed. Attention is given to variations of the spatial sensitivity and to loss of spatial resolution, both of which may occur in this type of system. (14 refs.)

70138 An elongated trapped-ion cell for ion cyclotron resonance mass spectrometry with a superconducting magnet. R.L.Hunter, M.G.Sherman, R.T.McIver,Jr. (Dept. of Chem., Univ. of California, Irvine, CA, USA).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.50, no.3, p.259-74 (15 May 1983).
A one-region trapped-ion analyzer cell that is elongated in the dimension parallel to the magnetic field is described and shown to be well suited for ion cyclotron resonance (ICR) experiments using a solenoidal-geometry superconducting magnet. An analysis of the static electric fields inside the elongated cell shows that the resonance frequency of the ions is far less affected by the trapping voltages than with a cubic cell or the original trapped-ion cell. The main advantage of the elongated cell are improved mass measurement accuracy and increased dynamic range. (27 refs.)

70139 Operational features resulting in mass spectrometers from NPM-0.1 vapor-jet vacuum pumps. V.I.Ermolov, Yu.S.Kusner, K.M.Moskalenko (Inst. of Thermophys., Acad. of Sci., Novosibirsk, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.992-4 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.192-3 (July-Aug. 1982). [received: May 1983]
Distortions which develop in a mass spectrum when the ion source of the mass spectrometer is evacuated with an NPM-0.1 vapor-jet pump are considered. It has been shown in the experiments that, under typical conditions, the pumping rate is a function of the outlet pressure and the molecular mass of the component under consideration. Errors which are made in measurements of the intensity ratio of the mass spectrum lines can reach the order of magnitude of the square root of the ratio of the component masses. Several practical recommendations for eliminating the mechanism leading to the distortion of a spectrum are discussed. (8 refs.)

70140 Calibration of a mass spectrometer in static operation. E.V.Popov, A.Ya.Kupryazhkin (Urals Polytech. Inst., USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.994-6 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.194-5 (July-Aug. 1982). [received: May 1983]
A method is proposed of calibrating an MI-1305 mass spectrometer in static operation by expanding the gas from a small volume into a large volume and using a capacitive micromanometer. A ^{4}He sensitivity of the mass spectrometer of ^{4}He $\gamma = (4.1 \pm 0.1) \times 10^{-7}$ Pa/mV was obtained. (5 refs.)

70141 Ion source of ROMS-2 mass spectrometer with fragmentless ionization. N.N.Ledneva, Kh.I.Pruger, A.A.Rivlin.
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1025-6 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.222-3 (July-Aug. 1982). [received: May 1983]
A modernised ion source for the ROMS-2 mass spectrometer is described which, allows mass spectra to be obtained without molecular fragments. (no refs.)

70142 A new accelerator-based mass spectrometry. H.E.Gove (Nuclear Structure Res. Lab., Univ. of Rochester, Rochester, NY, USA).
Phys. Teach. (USA), vol.21, no.4, p.237-45 (April 1983).
A new and important practical use has recently been made of accelerators that are normally employed for basic research on the properties of the atomic nucleus. These machines are called tandem electrostatic accelerators and they produce beams of energetic positive ions. These ions are used to penetrate the nucleus of atoms in a target thereby inducing a variety of nuclear reactions whose detailed study elucidates the varied properties of the nucleus. A tandem accelerator begins by producing a negative ion. These ions are attracted to the positive terminal of the accelerator through an evacuated tube and arrive there with velocities that are 2 to 3% of the velocity of light. Inside the positive terminal, the ions pass through a thin foil or a gas-filled canal where they suffer collisions with the atoms of the foil or gas. In these collisions, they change from singly charged negative ions to multiply charged positive ions. They are then accelerated away from the terminal through the second half of the tandem and arrive back at ground potential traveling even faster (with velocities close to 10% of the velocity of light). At this stage they are accurately energy-analyzed and directed toward the target by magnetic and electric deflecting fields. The whole system acts like a mass spectrometer. (3 refs.)

70143 A small universal quadrupole mass spectrometer. I.Berecz, S.Bohatka, J.Gal, L.Kiss, G.Langer, A.Paal, R.M.Kovacs (Inst. of Nuclear Res., Hungarian Acad. of Sci., Debrecen, Hungary).
Vacuum (GB), vol.33, no.1-2, p.69-70 (Jan.-Feb. 1983). (Proceedings of the 2nd Joint Meeting of the Roland Eotvos Physical Society (Vacuum Physics and Thin Films Sections) and the Austrian Vacuum Society, Brunn am Gebirge, Austria, 27-29 Oct. 1981).
A universal quadrupole mass spectrometer (type Q60U) has been constructed for general laboratory and industrial purposes. Its 10 cm long analyser rod system, 1-60 amu mass range and 4.10^{-4} A mbar^{-1} sensitivity make it a good residual gas analyser. Due to its high mass resolution it can be used also as an analytical instrument. It works as a total pressure gauge too, saving the cost of a vacuum gauge. The bias and gain controls and audio-frequency signal generator of its leak detection unit complete the quadrupole as a sensitive multi-test gas leak detector. (2 refs.)

70144 Peak selector for quadrupole mass spectrometer. I.Berecz, S.Bohatka, Z.Dios, G.Langer (Inst. of Nuclear Res., Hungarian Acad. of Sci., Debrecen, Hungary).
Vacuum (GB), vol.33, no.1-2, p.87-8 (Jan.-Feb. 1983). (Proceedings of the 2nd Joint Meeting of the Roland Eotvos Physical Society (Vacuum Physics and Thin Films Sections) and the Austrian Vacuum Society, Brunn am Gebirge, Austria, 27-29 Oct. 1981).
A modern construction peak selector based on digital techniques has been constructed. The instrument can be extended to a maximum of nine signal channels selecting the ion-current with the help of thumbwheel switches. In the first channel it is possible to set the full mass range, while in each one of the other eight channels a width of a maximum of nine atomic mass units can be set. The instrument has got a mass identifier circuit and optionally each channel has a fast analog signal processing unit. The peak selector can be coupled to any kind of quadrupole mass spectrometer with a maximum mass range up to 512 amu. (1 ref.)

07.77 PARTICLE BEAM PRODUCTION AND HANDLING; TARGETS

(see also 29.25 in elementary-particle and nuclear physics, 41.80 Particle beams and particle optics)

70145 Measurement of virtual crossover in liquid gallium ion source. M.Komuro, T.Kanayama, H.Hiroshima, H.Tanoue (Electrotech. Lab., Ibaraki, Japan).
Appl. Phys. Lett. (USA), vol.42, no.10, p.908-10 (15 May 1983).
Gallium ion probes of 50 keV obtained from a liquid metal ion source are recorded on silicon and gallium arsenide substrates by using the method of ion bombardment enhanced etching. The minimum linewidth obtained in line exposures is about 20 nm for both substrates which corresponds to the lateral spread of the implanted ions. For a specified value of the lens acceptance half-angle, the line dose varies as a square function of the linewidth, which means that distribution of the current density in the focused beam is Gaussian. From the theoretical evaluation of the full widths at half-maximum of these distributions, the virtual crossover diameter of the source is estimated to be 40-45 nm independently of the emission current ranging from 4 to 12 μA, and of the value of the needle apex radius of the source in the range 1-3 μm. (7 refs.)

70146 Development status of a cesium field emission thruster. J.P.Bugeat, D.Valentian (SEP Space Div., Vernon, France).
Acta Astronaut. (GB), vol.9, no.9, p.581-2 (Sept. 1982). [received: March 1983]
A laboratory field emission thruster has been developed and tested using cesium as a propellant. Extensive testing has been performed with positive pressure feeding and ion optics distance variation. Thrust is higher than 1 mN. (5 refs.)

70147 Flight time of relativistically fast particles in crossed toroidal electric and inhomogeneous magnetic fields. H.Nakabushi (Dept. of Phys., Osaka Univ., Toyonaka, Japan), T.Sakurai.
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.50, no.3, p.275-86 (15 May 1983).
The second-order flight time deviations of charged particles moving with relativistic energies in crossed toroidal electric and inhomogeneous magnetic fields have been calculated. The results can be used for superimposed or pure electric and magnetic fields as well as for Wien filters. (4 refs.)

70148 Device for measuring the energy reflection coefficient in charged-particle bombardment of a metal. N.N.Koborov, V.A.Kurnaev (Moscow Engng. Phys. Inst., Moscow, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.971-5 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.173-6 (July-Aug. 1982). [received: May 1983]
A device and a simple method of measurement are described for measuring the energy reflection coefficient R_E for a metal target bombarded by a charged-particle beam at any angle. The temperature transducers for the target and heater are unencapsulated silicon transistors. The absolute error in determining R_E is not more than ± 0.025. (7 refs.)

70149 Pulse transformer drive circuit for a molecular-beam source. R.J.Rorden, D.M.Lubman (Quanta-Ray Inc., Mountain View, CA, USA).
Rev. Sci. Instrum. (USA), vol.54, no.5, p.641-3 (May 1983).
The authors introduce the use of a pulse transformer as an improvement in the drive circuit of the 'hairpin loop' design for a pulsed molecular-beam source. The virtue of this device is that it can produce the high currents

necessary to drive the hairpin at low voltage. In addition, it minimizes the I^2R power loss of former designs while allowing for proper impedance matching of the leads to the power supply, thus lowering the voltage requirements necessary to drive the circuit. (24 refs.)

70150 Application of physical effects for the detection of small ion currents in vacuum. K.H.Krebs (Zentralinst. fur Elektronenphys., Akad. der Wissenschaften, Berlin, Germany).
Vacuum (GB), vol.33, no.1-2, p.7-11 (Jan.-Feb. 1983). (Proceedings of the 2nd Joint Meeting of the Roland Eotvos Physical Society (Vacuum Physics and Thin Films Sections) and the Austrian Vacuum Society, Brunn am Gebirge, Austria, 27-29 Oct. 1981).
In many fields of experimental physics (e.g. mass spectrometry, analysis of solids, nuclear physics, etc.), it is necessary to detect small ion currents ($<10^{-16}$ A) in vacuum. Generally, ion-electron converters are used for this purpose. The working principle of these converters is determined by the physical effect of ion-induced kinetic electron emission from solids. After presentation of the details of particular equipment, the parameters affecting the electron emission are discussed. The effects of these parameters on the two possible detection methods—current measurement and pulse counting—are treated. Specific attention is given to the statistics of electron release and its effect on the detection probability. (25 refs.)

70151 Tunneling current microscopy. P.S.D.Lin, H.J.Leamy (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.717-19 (15 April 1983).
The field dependence of electron beam induced current in thin oxide (22.5 nm) capacitors has been studied with a view of using the induced current for detecting defects in such devices. Results indicate that the induced current follows Fowler-Nordheim tunneling behavior when the field exceeding 4 MV/cm, and that a certain type of defect in thin oxide capacitors can be imaged with high contrast and low noise. A high current gain ($\sim 10^3$) of the induced current was also obtained. These findings open the possibility of acquiring information on the quality and reliability of composite metal-insulator-metal/semiconductor structures, and of achieving a high current for signal amplification. (9 refs.)

70152 Continuous-running electron gun with a large-area plasma cathode. Yu.E.Kreindel', V.Ya.Martens, V.Ya.S'edin, S.V.Gavrintsev (Tomsk Inst. of Automatic Control Systems & Electronics, Tomsk, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.977-9 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.178-80 (July-Aug. 1982). [received: May 1983]
A description is given of an electron gun with a plasma cathode that produces an electron beam of diameter 100 mm with a nonuniformity of $\leq +6\%$ in the distribution of the current density over the cross section and a current up to 0.5 A for an accelerating voltage up to 15 kV. The plasma emitting surface is produced by the penetration of charged particles from a low-voltage hollow-cathode discharge into an expander. The beam acceleration and formation are provided by a multiaperture electrooptical system. (5 refs.)

70153 Optimisation of electron energy analysers for application in coincidence experiments. M.Volkel, W.Sandner (Fakultat fur Phys., Univ. Freiburg, Freiburg, Germany).
J. Phys. E (GB), vol.16, no.5, p.456-62 (May 1983).
The coincidence width in electron-particle coincidence experiments is investigated in detail. It is shown that, since the advent of channel plates replacing channeltrons, the major contribution comes from different flight paths inside the electron energy analysers. Two different methods are presented for compensating this time spread; in a first experimental application a reduction by more than a factor of 6 in the coincidence width was achieved. (36 refs.)

70154 Jump ratio as a measure of spectrometer performance. R.F.Egerton (Phys. Dept., Univ. of Alberta, Edmonton, Canada), J.Sevely.
J. Microsc. (GB), vol.129, pt.3, p.RP1-2 (March 1983). (MICRO 82: High Resolution Electron Microscopy, London, England, 12-16 July 1982).
Increaasing numbers of transmission electron microscopes have been equipped with an electron energy-loss spectrometer, largely for microanalysis of low-atomic-number elements via the measurement of inner-shell ionization edges. For good elemental sensitivity, an important experimental parameter is the energy resolution of the spectrometer, for a given range of entrance angles. However, another desirable property is a low background in the energy-loss spectrum. However, an additional instrumental contribution can originate from within the electron-optical system; in the case of serial recording, this arises mainly from electron backscattering at the detector slit and from X-ray generation at the slit. A convenient estimate of total (instrumental+specimen-generated) background is obtained by measuring the jump ratio at a suitable ionization edge. Evaporated films of amorphous carbon form a suitable test specimen, since these are readily prepared and give a K-ionization edge which is easy to measure. (6 refs.)

70155 Methods of amplifying magnetic contrast type I in scanning electron microscope. A.Walczak.
Pr. Inst. Tele- & Radiotech. (Poland), no.92, p.34-44 (1983). In Polish.
The paper deals with the conditions and methods for amplifying contrast of the magnetic domains picture obtained in the signal of secondary electrons (type I) in scanning electron microscope (SEM). The effect of geometrical and electronic parameters on the contrast level is discussed. Some applications examples are also given. (6 refs.)

70156 Electron beam blanking systems. H.Fujioka, K.Ura (Electron Beam Lab., Osaka Univ., Osaka, Japan).
Scanning (Germany), vol.5, no.1, p.3-13 (1983).
Electron beam blanking in the scanning electron microscope (SEM) by deflection over a chopping aperture is reviewed. The first part is connected with electron beam deflection structures and driving methods, the second part with the electron optics of deflection blanking systems in the SEM. (36 refs.)

70157 Signal mixing techniques in scanning electron microscopy. B.Volbert (S&I Electron Optics Applications Lab., NV Philips' Gloeilampenfabrieken, Eindhoven, Netherlands).
Scanning Electron Microsc. (USA), pt.3, p.897-905 (1982).
Separation of different contrasts (i.e. material and topographic contrast) using a 2-detector system (A,B) can be obtained by signal mixing (A+B, A−B) in the backscattered electron (BSE) mode. Imaging a multicompositional specimen at high primary electron (PE) energies, the BSE(A−B) micrographs show a pseudotopography which is caused by anisotropic backscattering of the BSE at the material boundaries. In addition the resolution of the true surface topography is very poor due to the large information depth of the BSE. Using two oppositely placed Everhart-Thornley detectors and a grid above the specimen, true surface imaging is also possible at high PE-energies in the SE(A−B) mode, in which the two SE-signals are subtracted. A multi-function-detector system (MFD) in combination with the normally used Everhart-Thornley detector allows the simultaneous detection of SE and BSE. Therefore the generation of the signal (SE-BSE) is possible. Due to the fact that the BSE- or depth-information in the (SE-BSE) signal is suppressed the latter signal shows a smaller information depth compared with the SE-signal. Also the material contrast fully disappears. The (SE-BSE) signal gives the 'true' topography of a multicompositional specimen at high PE-energies without any artefacts. Depth characterisation of information is possible by using the BSE(A+B) signal for subsurface information and the (SE−BSE) signal for surface information. (18 refs.)

70158 Voltage contrast isolation by frame-by-frame subtraction in the scanning electron microscope. H.Fujioka, M.Tsujitake, K.Ura (Electron Beam Lab., Osaka Univ., Osaka, Japan).
Scanning Electron Microsc. (USA), pt.3, p.1053-60 (1982).
A method for isolating voltage contrast by frame-by-frame digital processing has been developed. The SEM images of various different states of a tested device, e.g. images at unbiased and biased states or several stroboscopic images at different phases, are sampled and stored in a microcomputer. Then, the system allows the isolation of voltage contrast changes between any two stored images by frame-by-frame digital processing. The basic feature over other methods is the separation of image acquisition and voltage contrast isolation which increases the system flexibility: different types of processing such as subtraction, normalization, or gray-level display can be carried out after the image data acquisition is terminated. Furthermore, the separate operation can reduce the interaction time between the electron beam probe and the tested device. (16 refs.)

07.85 X-RAY, GAMMA-RAY INSTRUMENTS AND TECHNIQUES

70159 A soft X-ray streak camera. G.L.Stradling (Lawrence Livermore Nat. Lab., Livermore, CA, USA), D.T.Attwood, R.L.Kauffman.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.604-15 (April 1983).
A soft X-ray streak camera is presented which offers wide application for picosecond recording of transient signals in the spectral range from the VUV to the very hard X-ray region. Specific demonstration results are presented from laser-fusion diagnostic studies. Dynamic characterization of the streak camera, new photocathode studies, and the application of intermediate and broad spectral selectivity techniques are discussed. (43 refs.)

70160 Quantitative intensity measurements using a soft X-ray streak camera. R.L.Kauffman (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.616-21 (April 1983).
A soft X-ray streak camera (SXRSC) has been calibrated in order to make absolute flux measurements of X-rays emitted from laser-produced plasmas. The SXSRC is used to time-resolve X-ray pulses to better than 20 ps. The SXRSC uses an Au photocathode on a thin carbon substrate which is sensitive to X-rays from 100 eV to greater than 10 keV. Calibrations are done in the dynamic mode using a small laser-produced X-ray source. The SXRSC is calibrated by comparing its integrated signal to the output of calibrated X-ray diodes monitoring the source strength. Details of the experiment along with data from a typical calibration are presented. The measured SXRSC intensity response is linear over greter than two orders of magnitude. Using these calibrations, absolute intensities can be measured to an accuracy of ±30 percent. An example of its use as a flux monitoring device is presented. (15 refs.)

70161 Photocathodes for X-ray electron-optical convertors. E.D.Baeva, E.I.Zak, L.I.Kondrashova, B.M.Stepanov, I.G.Tverdokhleb (All-Union Phys. Optics Res. Inst., Moscow, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.988-90 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.188-90 (July-Aug. 1982). [received: May 1983]
A method is described for flight measurement of the current quantum yield κ_c of metal, insulating, and double photocathodes for X-ray electron-optical converters (XEOC) for X-ray wavelengths λ of 1.5-1.7 Å. The quantum yields have been calculated from the pulse number and from the number of electrons in a pulse. The half-width ΔE of the electron energy distribution has been determined. The most efficient cathodes for XEOC are Au, CsI photocathodes and double photocathode systems with Cs_3Sb on Au and Cs_3Sb on CsI, which have κ_c in the range 0.15-0.6 electrons with $\Delta E = 15$-25 eV. (6 refs.)

70162 Use of an X-ray diffractometer to investigate fluorescence radiation. B.A.Mel'nik (Inst. of Casting Problems, Acad. of Sci., Kiev, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1018-19 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.215-16 (July-Aug. 1982). [received: May 1983]
The DRON-2.0 X-ray diffractometer is used to carry out a fluorescence analysis. The specimen being investigated is placed in the holder of the monochromator unit, and the crystal analyzer is attached to the holder, which is on the axis of the goniometer. (2 refs.)

70163 Measurement of the energy spectrum of nanosecond X-ray pulses. L.Ya.Morgovskii, B.V.Kagan, O.S.Marnekov.
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1019-21 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.216-18 (July-Aug. 1982). [received: May 1983]
The energy spectra of the radiation of the MIRa pulsed X-ray apparatus using tubes with explosive electron emission have been measured. The filter method with selection of statistical data has been used. The spectra have been established using a version of the regularization method. (9 refs.)

70164 Multilayer films for soft X-ray optics. G.V.Marr.
Phys. Bull. (GB), vol.34, no.5, p.204-6 (May 1983).
The soft X-ray part of the electromagnetic spectrum lies between the vacuum ultraviolet and the conventional X-ray regions. It is defined by specifying a wavelength range of about 10-0.5 nm. Normal incidence reflectivities of simple surfaces are negligibly small at these wavelengths, and so it is common practice to use grazing incidence optics to focus the radiation. However the focusing properties of such cylindrical or toroidal mirrors are limited by severe aberrations, and monochromators have, at best, moderate resolution. Moreover, the general use of the radiation flux is inefficient. There is, therefore, a need for optical elements with usable reflectivities at near normal incidence. Progress reported at recent conferences suggests that multilayer films can meet these requirements and that the design and manufacturer of normal incident optical elements are technically feasible. This represents a big step forward for the soft X-ray optics used at synchrotron facilities (where, at present, 1 m long grazing incidence mirrors intercept and image the radiation), for soft X-ray astronomy and for studies of radiation from high temperature plasmas. (4 refs.)

70165 ZAP—a standardless X-ray microanalysis computer program. D.A.Gedcke, L.G.Byars, W.H.Hardy (EG&G ORTEC, Oak Ridge, TN, USA).
Scanning Electron Microsc. (USA), pt.3, p.981-93 (1982).
A computer program has been developed for standardless energy dispersive X-ray microanalysis of metal and oxide samples. The program includes automatic background subtraction, peak overlap correction including escape peaks, detector efficiency correction, and relative atomic, absorption, and characteristic line fluorescence corrections. The background model includes improvements relative to previously published algorithms. The program requires very little operator intervention and provides high analytical throughput. The method is insensitive to drifts in the microscope beam current and by virtue of its speed, less demanding on long term accelerating voltage stability. Results on a variety of samples indicate that the no-standards technique can provide good accuracy. (20 refs.)

Microdefects in X-ray radiation detectors .... See Entry 70748

10.00 THE PHYSICS OF ELEMENTARY PARTICLES AND FIELDS

(for cosmic rays, see 94.40; for high energy-experimental techniques and instrumentation, see 29.)

11.00 GENERAL THEORY OF FIELDS AND PARTICLES

(see also 03.65 Quantum mechanics, 03.70 Theory of quantized fields, 03.80 General theory of scattering)

11.10 FIELD THEORY

70166 The Schwinger model: a view from the temporal gauge. P.Becher (Phys. Inst., Univ. Wurzburg, Wurzburg, Germany).
Ann. Phys. (USA), vol.146, no.2, p.223-61 (1 April 1983).
The author presents a new operator solution of the Schwinger model, i.e. of massless quantum electrodynamics in 1+1 dimensions in the temporal gauge $A^0=0$. This gauge is well-suited for the treatment of static external charges. The energy functional reflects the immediate onset of pair creation of massless fermions. The author shows that every point charge is screened completely by a Yukawa-like polarisation charge cloud of radius $\sqrt{\pi}/e$, e the coupling constant. (77 refs.)

70167 Microcanonical quantum field theory. A.Strominger (Inst. for Advanced Study, Princeton, NJ, USA).
Ann. Phys. (USA), vol.146, no.2, p.419-57 (1 April 1983).
The author develops a fixed action (microcanonical) formulation of quantum field theory. For the case of ordinary renormalisable field theories, it is shown that the microcanonical is entirely equivalent to the canonical formulation. That is, for some particular fixed value of the total action, the Green's functions of the microcanonical theory are equal, in the bulk limit, to those of the canonical theory. The microcanonical perturbation expansion is developed in some detail for $\lambda\phi^4$. The particular value of the action for which the two formulations are equivalent can be calculated to all orders in perturbation theory. The author proves, using Lehmann's Theorem, that this value is one-half Planck unit per degree of freedom, if fermionic degrees of freedom are counted negatively. The one exception to this is supersymmetric theories, where a microcanonical formulation exists if and only if supersymmetry is broken. Finally, it is argued that a microcanonical formulation of quantum gravity may be less pathological than the usual canonical formulation. The relation between the total action and the temperature $\hbar$ is calculated to all orders using the gravitational Schwinger-Dyson equations. (16 refs.)

70168 N=1 superspace formulation of N=2 and N=4 super-Yang-Mills models with central charge. B.Milewski (CERN, Geneva, Switzerland).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.172-88 (9 May 1983).
The component models of $N=2$ and $N=4$ supersymmetric Yang-Mills theories of Sohnius, Stelle and West (1980) are reformulated in terms of $N=1$ superfields. The nonsupersymmetric constraints are supersymmetrized generalizing the linear multiplet in the presence of the nonAbelian gauge superfield and (in the $N=4$ case) a doublet of chiral superfields. The extended supersymmetry transformations preventing constraints are explicitly given in terms of $N=1$ superfields. The authors are able to introduce the constraints back into the Lagrangian using superfield Lagrange multipliers. The on-shell equivalence of this formulation with the formulation of Fayet (1979) with one (for $N=2$) and three (for $N=4$) chiral superfields is shown. The Abelian $N=2$ model is worked out to show the connection between full superspace treatment and the $N=1$ superfield formulation. (11 refs.)

70169 The N=4 supersymmetric E_8 gauge theory and coset space dimensional reduction. D.Olive (Blackett Lab., Imperial Coll., London, England), P.West.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.248-84 (9 May 1983).
Reasons are given to suggest that the $N=4$ supersymmetric E_8 gauge theory be considered as a serious candidate for a physical theory. The symmetries of this theory are broken by a scheme based on coset space dimensional reduction. The resulting theory possesses four conventional generations of low-mass fermions together with their mirror particles. (50 refs.)

70170 The quantum kinks of two-dimensional theories of the ϕ^4 type. E.C.Marino (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.413-29 (23 May 1983).
The author applies a recently established method of kink quantization, to two-dimensional theories of the ϕ^4 type possessing either a $Z(4)\times O(N)$ or an $SU(N)$ symmetry and containing N complex scalar fields. Correlation functions of kinks are estimated through a $1/N$ expansion. Quantum kinks are interpolated by a local field, whenever a broken symmetry phase occurs. These kinks are massless. This result holds up to all orders in $1/N$. (15 refs.)

70171 Superspace, dimensional reduction, and stochastic quantization. B.McClain, A.Niemi, C.Taylor, L.C.R.Wijewardhana (Dept. of Phys., MIT, Cambridge, MA, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.430-60 (23 May 1983).
The equivalence between a 6-dimensional stochastic classical scalar field theory and the corresponding 4-dimensional quantum field theory has been shown to stem from a hidden supersymmetry of the former. This has led to a formulation of quantum field theory in a superspace of 6 commuting and 2 anticommuting dimensions. The authors study gauge and spinor field theories defined on this superspace, showing that the dimensional reduction is a consequence of the geometry of the superspace, and that the stochastic formalism for gauge theories is a natural consequence of the structure of the superspace theory. This allows us to extend the stochastic formalism to include spinors. (15 refs.)

70172 Detection of master fields near factorization. J.Carlson, M.B.Halpern (Dept. of Phys., Univ. of California, Berkeley, CA, USA), J.Greensite, T.Sterling.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.461-4 (23 May 1983).
In reduced models the authors verify numerically the onset of factorization (N^{-1} fluctuations), and the forming up of master fields in that regime. (7 refs.)

70173 From N=1 to N=4 extended supersymmetric Yang-Mills fields in a covariant Wess-Zumino gauge. R.Flume (Phys. Inst., Univ. Bonn, Bonn, Germany).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.531-43 (23 May 1983).
It is assumed that $N=1$ supersymmetric Yang-Mills fields coupled to chiral matter fields can be renormalized in a covariant Wess-Zumino gauge with a minimal number of subtractions so that the Ward identities of supersymmetry, ordinary gauge invariance and matter-field-flavour symmetries are satisfied. The chiral Yukawa couplings are supposed to remain unrenormalized. It is shown that on the basis of these assumptions an $N=4$ extended manifestly O(4) invariant theory can be constructed with finite Yukawa and ϕ^4 couplings. A consequence of these nonrenormalizations is the vanishing of the renormalization group β function. (11 refs.)

70174 How well do Monte Carlo simulations distinguish between U(1) and SU(2)? A study of the string tension in U(1) lattice gauge theory. D.G.Caldi (Werner-Heisenberg-Inst. fur Phys., Max-Planck-Inst. fur Phys. und Astrophys., Munchen, Germany).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220 (FS8), no.1, p.48-60 (16 May 1983).
To investigate how a system with a known deconfining phase transition behaves when studied on finite lattices via Monte Carlo simulations, the author has made such studies of compact U(1) lattice gauge theory for 8^4, 10^4, and 12^4 lattices. The author has concentrated on the mean plaquette energy and the string tension. The string tension does not vanish on a finite lattice, but using finite size scaling arguments the indications are that it does vanish on an infinite lattice, where the author predicts the critical coupling $\beta_c=1.008$ and the correlation length exponent $\nu={}^1/_3$. The author compares these results to those for SU(2) and finds that although there are differences, they are not yet definitive. (20 refs.)

70175 A Monte Carlo study of the Gross-Neveu model. Y.Cohen, S.Elitzur, E.Rabinovici (Racah Inst. of Phys., Hebrew Univ., Jerusalem, Israel).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220 (FS8), no.1, p.102-18 (16 May 1983).
Several lattice versions of the Gross-Neveu model are constructed and studied using Monte Carlo methods. The expected chiral structures are confirmed by the numerical results. The correct asymptotic freedom behaviour is recovered with the appropriate number of species taken into account. The models differ in their number of soft modes and their strong coupling behaviour. In some of them, chiral symmetry is restored at a finite coupling. The large-N finite-temperature transition is also found in good agreement with the theoretical value. (11 refs.)

70176 Mass spectra of new particles. Hu Ning (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).
Commun. Theor. Phys. (China), vol.1, no.1, p.59-67 (1982).
When $\psi(4030)$ is considered as a molecule formed from D^* and $\bar{D}^*$ and not as an excited state of J/ψ, then all excited states of J/ψ may be described by a wave equation of simple harmonic oscillator, with eigenvalues equal to the

squared masses of these states. The same conclusion is also obtained for Υ particles. (2 refs.)

70177 New nonlinear σ models on symmetric spaces. Chou Kuang-chao (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China), Song Xing-chang.
Commun. Theor. Phys. (China), vol.1, no.1, p.69-75 (1982).
Finally two new nonlinear σ models, defined on the symmetric coset spaces $GL(n,c) \otimes GL(n,c)/GL(n,c)$ and $GL(n,c)/U(n)$ respectively. The latter may be useful in discussing the four-dimensional Yang-Mills fields. (5 refs.)

70178 Exotic gauge potential representations and ghost counting via orthosympletic BRS supersymmetry. R.Delbourgo, P.D.Jarvis (Dept. of Phys., Univ. of Tasmania, Sandy Bay, Tasmania, Australia).
J. Phys. A (GB), vol.16, no.8, p.L275-8 (1 June 1983).
Generalised gauge fields and their accompanying ghosts are naturally accommodated in representations of an orthosymplectic supergroup. Counting rules are given for arbitrary irreducible tensors of $OSp(n/m)$, and the connection with representations of the transverse orthogonal group $O(n\text{-}m)$ for 'massless' states is pointed out. (18 refs.)

70179 Angular-momentum operators for dyons. D.S.Bhakuni, O.P.S.Negi, B.S.Rajput (Dept. of Phys., Kumaun Univ., Naini Tal, India).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.15, p.499-502 (9 April 1983).
The study of gauge invariant and rotationally symmetric angular-momentum operators of dyons has been undertaken and the corresponding properties of their eigenvalues have been analysed. It has been shown that the presence of magnetic charge on dyons gives rise to a residual angular momentum and chirality-dependent multiplicity in the eigenvalues of the third component of the angular-momentum operator. (9 refs.)

70180 Main field and symmetric-hyperbolic form of the Dirac equation. A.Strumia (Istituto di Mathematica Applicata, Univ. di Bologna, Bologna, Italy).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.18, p.609-13 (30 April 1983).
A method to obtain a symmetric-hyperbolic system of conservative equations starting from a complex system of conservation laws and their complex conjugate with one supplementary real conservative equation is proposed when a suitable condition equivalent to convexity is fulfilled. It is shown that the Dirac equation fulfils the predicted condition and can be written in symmetric-hyperbolic form. (14 refs.)

70181 Evaporation, annihilation and strong decays of long-lived quarkonia as finite-to-null and null-to-finite temperature processes. S.Iwao (Dept. of Phys., Coll. of Liberal Arts, Kanazawa Univ., Kanazawa, Japan).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.1, p.21-7 (7 May 1983).
Particle evaporation from nuclei, $\bar{p}p$ stop in annihilation, heavy quarkonium and glueball decays have been investigated in the framework of Green's function approach. The author presents ideas for understanding the long life-time of the $\bar{p}$-nucleus system and the so-called Okubo, Zweig and Iizuka rule for the heavy-quarkonium decay. (20 refs.)

70182 The fine-structure constant, magnetic monopoles and Dirac charge quantization condition. T.Datta (Phys. & Astron. Dept., Univ. of South Carolina, Columbia, SC, USA).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.2, p.51-4 (14 May 1983).
The authors discuss the implications of the Dirac quantisation condition on the nature and stability of magnetic monopoles. One of the most interesting results is that such a particle has a classical radius larger than its quantum (Compton) or 'atomic' (Bohr) radius. No other elementary particle shows this property. This indicates that the monopoles and inherently relativistic. Atom-like stable bound states of oppositely charged monopoles are unphysical and a pair of primordial monopoles are prone to annihilation, which may explain the so-called monopole paradox. Conversely, if the value of the Sommerfeld fine-structure constant were greater than unity, then 'magnetic-monopole atoms' would have been stable and 'electric atoms' unstable. It appears that in a physical universe for a given value of the fine-structure constant only one kind of sources or charges (either electric or magnetic) are permissible. This is a quite general requirement imposed by the laws of electrodynamics, quantum mechanics and relativity acting simultaneously in conjunction to each other. (11 refs.)

70183 Critical-voltage law for chiral particle production near a monopole. Y.Srivastava, A.Widom (Lab. Nazionali di Frascati, Istituto Nazionale di Fisica Nucleare, Frascati, Italy).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.2, p.77-80 (14 May 1983).
Recent progress in understanding the implications of winding-number transitions and topological quantized magnetic flux in terms of a sine-Gordon theory in charge space, is here discussed in terms of a previously derived critical-voltage law for such processes in superconducting rings. In particular, chiral particle production in the neighbourhood of a monopole will be of interest. (11 refs.)

70184 The dynamical differential forms of the Klein-Gordon field. R.Arens (Dept. of Math., Univ. of California, Los Angeles, CA, USA).
Lett. Math. Phys. (Netherlands), vol.7, no.2, p.117-19 (March 1983).
The author classifies the conserved currents for the Klein-Gordon field. It is shown that there are many which are not associated with invariances of the Lagrangian. (3 refs.)

70185 Particle creation with finite energy density. T.Dray, J.Renn, D.Salisbury (Freie Univ. Berlin, Berlin, Germany).
Lett. Math. Phys. (Netherlands), vol.7, no.2, p.145-53 (March 1983).
The authors consider the semiclassical quantization of the Klein-Gordon field on a Robertson-Walker background with a flat-out region. They show that the requirement that the energy density of created particles be finite selects a preferred equivalence class of particle definitions. They present a representative element of the equivalence class so determined. They briefly discuss the generalization to Bianchi *I* spacetimes, and the case of an external Maxwell field. (8 refs.)

70186 Reduction and quantization for singular momentum mappings. J.Sniatycki (Dept. of Math. & Statistics, Univ. of Calgary, Calgary, Alberta, Canada), A.Weinstein.
Lett. Math. Phys. (Netherlands), vol.7, no.2, p.155-61 (March 1983).
When a Hamiltonian action of Lie group on a symplectic manifold has a singular momentum mapping, the reduced manifold may not exist. Nevertheless, one may always construct a Poisson alebra which corresponds to the functions on the reduced manifold in the regular case. The ideas of geometric quantization are extended to Poisson algebras, and it is shown in an example that quantization may be carried out before or after reduction, with isomorphic results. (12 refs.)

70187 Type-*D* solution of sourceless Yang-Mills equations. M.Carmeli, Kh.Huleihil (Center for Theoretical Phys., Ben Gurion Univ. of the Negev, Beer Sheva, Israel).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.3, p.245-57 (1 April 1983).
A solution of the classical sourceless Yang-Mills field equations, using the null-tetrad method, is presented. The solution, which includes only the magnetic part, is of type D_p in Carmeli's classification, class *A* in Castillejo-Kugler-Roskie's (1979) classification scheme, and case 3_b in that of Wang-Yang (1978). (12 refs.)

70188 Gel'fand-Yaglom wave equations based on the representation $(^1/_2, {}^5/_2) \oplus (-^1/_2, {}^5/_2) \oplus (^1/_2, {}^3/_2) \oplus (-^1/_2, {}^3/_2) \oplus (^1/_2, {}^3/_2) \oplus (-^1/_2, {}^3/_2)$. C.G.Koutroulos (Dept. of Theoretical Phys., Univ. of St. Andrews, St. Andrews, Fife, Scotland).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.3, p.277-301 (1 April 1983).
The charge associated with the Gel'fand-Yaglom wave equation based on the 20-dimensional representation $(^1/_2, {}^5/_2) \oplus (-^1/_2, {}^5/_2) \oplus (^1/_2, {}^3/_2) \oplus (-^1/_2, {}^3/_2) \oplus (^1/_2, {}^3/_2) \oplus (-^1/_2, {}^3/_2)$ is studied according to the definition, of Gel'fand and Yaglom. (6 refs.)

70189 A note on non-Noether constants of motion. M.Crampin (Faculty of Math., Open Univ., Milton Keynes, England).
Phys. Lett. A (Netherlands), vol.95A, no.5, p.209-12 (2 May 1983).
It is shown that various recent results on the existence of constants of motion not arising directly from Noether's theorem or similar considerations, such as the result of Hojman and Harleston (see J. Math Phys., vol.22, p.1414, 1981) for systems with alternative lagrangian formulations, are consequences of some rather simple and general facts of differential geometry. (18 refs.)

70190 Analytic regularization and supersymmetric Ward-Takahashi identities. S.Kumar, Y.Fuji (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.653-63 (Feb. 1983).
Supersymmetric Ward-Takahashi identities of the massless Wess-Zumino model are investigated by means of analytic regularization method. At the one-loop level the identities are satisfied by two- and three-point functions for all values of the regularizing parameter. At the two-loop level, the identity relating the three-point functions is satisfied, while the authors find a violation in the finite parts of the identity connecting the two-point functions if minimal subtraction is used to renormalize the theory. It is observed that this identity is restored if one employs a finite renormalization in addition to the minimal one. A calculation of the two-loop renormalization group function β is also presented. (16 refs.)

70191 Remarks on a stochastic quantization of scalar fields. J.R.Klauder (Bell Labs., Murray Hill, NJ, USA), H.Ezawa.
Prog. Theor. Phys. (Japan), vol.69, no.2, p.664-73 (Feb. 1983).
The Langevin equation approach to derive (non)equilibrium-distribution correlating functions for scalar fields is examined. Regularization introduced by the auxiliary time renders the parameters of the Langevin equation finite in the case of super-renormalizable models while causing no change in the boundary between renormalizability and nonrenormalizability. An heuristic central-limit-type argument is suggested to understand the free-field behavior of nonrenormalizable $(\phi^4)_n$ models, $n>4$. (11 refs.)

70192 Explicit evaluation of anomalies in higher dimensions. P.H.Frampton, T.W.Kephart (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA).
Phys. Rev. Lett. (USA), vol.50, no.18, p.1343-6 (2 May 1983).
The one-loop Kaluza-Klein anomaly is evaluated explicitly for gauge theories in six, eight, and ten dimensions. The result is well defined and unique, despite the nonrenormalizability of the theory. (6 refs.)

70193 Consistency conditions for Kaluza-Klein anomalies. P.H.Frampton, T.W.Kephart (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA).
Phys. Rev. Lett. (USA), vol.50, no.18, p.1347-9 (2 May 1983).
General consistency requirements on anomalies in $D=2n$ dimensions are derived with topological techiques. It is shown that for a non-Abelian gauge theory the group-theoretic piece of the anomaly is an overall multiplicative factor for any even $D \geq 4$. (10 refs.)

70194 Manifestly broken local symmetries at large *N*. W.Celmaster, F.Green (Dept. of Phys., Northeastern Univ., Boston, MA, USA).
Phys. Rev. Lett. (USA), vol.50, no.20, p.1556-9 (16 May 1983).
It is shown how, in the large-N limit of $SU(N)$ gauge theory, a local symmetry can be truly broken. This is illustrated by use of the exact solution of the two-dimensional theory in the presence of a vanishingly small symmetry-breaking source term. The model is also solved at finite N in order to study the approach to $N=\infty$. It is found that any finite-dimensional subgroup of $SU(\infty)$ can be broken. (16 refs.)

70195 Relativistic oscillator: linearly rising trajectories and structure functions. A.O.Barut (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA), H.Beker.
Phys. Rev. Lett. (USA), vol.50, no.20, p.1560-2 (16 May 1983).
A new class of realisations of the dynamical group $O(4, 2)$ depending on an arbitrary function G is found. As a special case it is applied to a moving relativistic composite object which in its rest frame is a three-dimensional oscillator. The wave equation is exactly solved; the generators of the Poincare group are identified. It can be applied to a moving 'bag' or bound state where the constituents are bound by a confining potential. The form factors and structure functions are discussed. (12 refs.)

70196 Topology and supersymmetry breaking in ten-dimensional super-Yang-Mills theory. P.K.Townsend (Lab. de Phys. Theorique, Ecole Normale Superieure, Paris, France).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.180-4 (28 April 1983).
Points out that the vacuum of ten-dimensional super-Yang-Mills theory is characterized by an angle θ, provided that the gauge group is $SU(N)$, $n \geq 5$, $SO(10)$, or E_6. Despite the presence of a massless fermion, θ is a physical parameter because there is no anomalous chiral $U(1)$ symmetry. The author argues that for $\theta \neq 0$ supersymmetry can be spontaneously broken by instanton-like effects. Parity is also broken for general $\theta \neq 0$. (12 refs.)

70197 The reduction of $N=1$ supersymmetric Yang-Mills theory to the light-cone gauge. Y.Hassoun, A.Restuccia, J.G.Taylor (Dept. of Math., King's Coll., London, England).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.197-200 (28 April 1983).
Describes in detail who the non-polynomial $N=1$ super Yang-Mills lagrangian in superfield form can be reduced to the light-cone gauge with only propagating modes. This is achieved by integrating out the inappropriate light-cone projections of the superspace Grassmann variables, leaving a light-cone superspace lagrangian agreeing with that obtained earlier by Taylor (1982). The implications of this for the construction of a covariant superfield version of $N=4$ SYM are discussed briefly. (13 refs.)

70198 Ten-dimensional supersymmetric Yang-Mills theory is not ultraviolet finite on-shell. C.Ragiadakos, J.G.Taylor (Dept. of Maths., King's Coll. London, London, England).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.201-3 (28 April 1983).
The authors find that the one-loop on-shell transition amplitude with four external fermions is not ultraviolet finite in the ten-dimensional supersymmetric Yang-Mills model. (10 refs.)

70199 Discrete chirality and fermion zero modes. S.De Lillo, G.Vitiello (Istituto di Fisica, Univ. di Salerno, Salerno, Italy).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.204-8 (28 April 1983).
In a quantum $1+1$ dimensional fermion-soliton system the boson condensation in terms of which the soliton solution can be described affects the fermionic structure behaviour due to the soliton non-trivial topology. The fermion zero-frequency mode is then required in order to recover the broken discrete chirality. (16 refs.)

70200 Anomalies and fermion masses in D dimensions. J.Preskill (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA), P.H.Frampton, H.van Dam.
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.209-11 (28 April 1983).
The authors show that anomalies in D spacetime dimensions are generated by only massless fermions, and note that the manner in which the anomalies of massive fermions cancel is qualitatively different in the two cases $D\equiv2$ and $D\equiv0$ (mod 4). (3 refs.)

70201 On the operator product expansion in the MS-scheme. F.V.Tkachov (Inst. for Nuclear Res., Acad. of Sci., Moscow, USSR).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.212-16 (28 April 1983).
The previously introduced 'extension principle' and R^*-operation are applied to deriving and studying a class of operator product expansions directly in the MS-scheme. Existence of simple explicit formulae for coefficient functions and the phenomenon of 'perfect factorization' are pointed out. (15 refs.)

70202 The algorithm for OPE coefficient functions in the MS scheme. S.G.Gorishny, S.A.Larin, F.V.Tkachov (Inst. for Nuclear Res., Acad. of Sci., Moscow, USSR).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.217-20 (28 April 1983).
Describes a method to derive explicit formulae for coefficient functions of the short-distance operator-product expansion in the MS scheme. (13 refs.)

70203 Reduced large N models as amorphous systems. I.Ya.Aref'eva (Steklov Math. Inst., Moscow, USSR).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.221-4 (28 April 1983).
A vacuum energy for the reduced large N model is estimated by means of the replica method. It is argued that a new phase can appear for the $\phi_D{}^4$ matrix model. This phase is a straightforward analogue of a spin glass phase in disordered spin models. (9 refs.)

70204 Large N limit of two parameter model with arbitrary representation. Fu-Goul Yee (Dept. of Phys., Columbia Univ., New York, NY, USA).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.225-36 (28 April 1983).
The author investigates the $N=\infty$ two parameter model, which consists of a fundamental representation action term and one other irreducible representation action term. This model can be reduced to a pure Wilson action with an effective inverse coupling. Two types of phase diagram are obtained. (14 refs.)

70205 Unconstrained prepotentials in extended superspace. J.Koller (California Inst. of Technol., Pasadena, CA, USA).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.324-8 (5 May 1983).
Presents a deductive method for solving superspace constraints in terms of unconstrained prepotentials which is applicable in extended superspace. The approach is demonstrated in detail for $N=1$ Yang-Mills, and then used to solve the $N=2$ Yang-Mills theory in $d=6$ to all orders. A simple method for writing gauge invariant actions is also given. (7 refs.)

70206 Instability of higher dimensional Yang-Mills systems. S.Randjbar-Daemi (Inst. fur Theoretische Phys., Vienna, Austria), A.Salam, J.Strathdee.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.345-8 (5 May 1983).
The authors investigate the stability of Poincare$\times$O(3) invariant solutions for a pure semi-simple Yang-Mills, as well as Yang-Mills coupled to gravity in 6-dimensional space-time compactified over $M^4\times S^2$. In contrast to the Maxwell U(1) theory in six dimensions coupled with gravity and investigated previously, the present theory exhibits tachyonic excitations and is unstable. (9 refs.)

70207 Compactification of supergravity plus Yang-Mills in ten dimensions. S.Randjbar-Daemi (Inst. fur Theoretische Phys., Vienna, Austria), A.Salam, J.Strathdee.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.349-52 (5 May 1983).
Investigates the criteria which determine supergravity-induced compactification of a supersymmetric Yang-Mills theory in ten dimensions down to spaces of the type (Minkowski)$\times$(G/H). (9 refs.)

70208 A manifestly conformally covariant CP^5 integral formula for massless fields. L.P.Hughston (Lincoln Coll., Oxford, England), T.R.Hurd.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.362-4 (5 May 1983).
The authors formulate a new twistor-type contour integral expression for massless fields which displays manifest conformal covariance. Compact complex Minkowski space is treated as a quadric hypersurface in CP^5. When a point at infinity is chosen to break conformal invariance, the formula can be reduced to the standard twistor contour integral formula due to Penrose (1975). (13 refs.)

70209 Partial color screening by classical Yang-Mills fields. J.E.Mandula (Washington Univ., St. Louis, MO, USA), D.I.Meiron, S.A.Orszag.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.365-8 (5 May 1983).
Non-Coulombic axially (but not spherically) symmetrical static solutions to the classical Yang-Mills equations in the presence of an external point source are numerically found. (21 refs.)

70210 A study of the non-compact non-linear σ model: a search for dynamical realizations of non-compact symmetries. Y.Cohen, E.Rabinovici (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.371-8 (5 May 1983).
The issue of dynamical linear realizations of non-compact symmetries is discussed. The two-dimensional non-compact $O(N,1)/O(N)$ is studied using various approximations. Monte Carlo simulations of the $O(2,1)/O(2)$ non-linear σ model are performed. No significant deviations from the perturbative region are detected. (24 refs.)

70211 The O_3 non-linear σ model in the semi-classical approximation. A.Rouet (Centre de Phys. Theorique, CNRS Luminy, Marseille, France).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.379-82 (5 May 1983).
It is shown that the O_3 nonlinear σ model defined in the semi-classical approximation exhibits a dynamical breaking of the chiral symmetry. The cluster property is satisfied by the isospin invariant observables. (8 refs.)

70212 Topological charge in the lattice Abelian Higgs model. B.Bunk, U.Wolff (Werner-Heisenberg-Inst. fur Phys., Max-Planck-Inst. fur Phys. und Astrophys., Munich, Germany).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.383-6 (5 May 1983).
A lattice version of the two-dimensional Abelian Higgs model is derived with emphasis on preserving the topological charge aspect of the continuum theory. The modulus of the Higgs field is not frozen, and a θ angle exists in the lattice quantum theory. It allows one to observe the topological charge in a Monte Carlo simulation and thus verify the semiclassical dilute vortex gas picture. (4 refs.)

70213 An analytic variational study of the phase structure of compact QED on the lattice. N.D.Hari Dass (CERN, Geneva, Switzerland), P.G.Lauwers, A.Patkos.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.387-93 (5 May 1983).
An analytical variational approach is applied to lattice gauge theories with Jastrow type functionals as ansatze. The results are presented for compact QED in three and four dimensions. (19 refs.)

70214 Quenched lattice gauge models. Zhang Yi-Cheng (SISSA, Trieste, Italy).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.394-6 (5 May 1983).
Shows that lattice gauge models can be studied in the complex coupling plane with couplings randomly distributed, its annealed version is the usual mixed action. The author proposes the quenched models and argue that they approach the continuum limit in a smoother way by avoiding first order phase transitions. (10 refs.)

70215 The hyper-Kahler supersymmetric σ-model in six dimensions. G.Sierra, P.K.Townsend (Lab. de Phys. Theorique, Ecole Normale Superieure, Paris, France).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.497-500 (12 May 1983).
The maximally supersymmetric, hyper-Kahler, σ-model is given in six-dimensional superfield form. The hyper-Kahler condition follows from the requirement that the equations of motion be derivable from an action. (8 refs.)

70216 Schwinger-Dyson equations in reduced, quenched, chiral models. F.Green (Dept. of Phys., Northeastern Univ., Boston, MA, USA).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.501-5 (12 May 1983).
It is shown that Schwinger-Dyson equations for the infinite volume U(N) chiral model and the reduced chiral model, quenched according to Parisi's prescription, agree to leading order in N for all values of the coupling and in any number of dimensions d. The conditions under which these equations can determine a theory uniquely are discussed. It is concluded that the two models are equivalent for $d\leq d_c=2$, but not necessarily for $d>d_c$. (15 refs.)

70217 Proper large N limit of the reduced models. Zhang Yi-Cheng (SISSA, Trieste, Italy).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.506-8 (12 May 1983).
Two different quenching prescriptions of the large N reduced models are confronted, essential differences are found and they are shown to be inequivalent. (8 refs.)

70218 Excited states and a fermion confinement in a four-Fermi model. P.Furlan (SISSA, Trieste, Italy), R.Raczka.
Phys. Lett. B (Netherlands), vol.124B, no.6, p.527-30 (12 May 1983).
A scalar-pseudoscalar four-Fermi quantum field model for a doublet of fermions is considered. It is shown by a partly nonperturbative analysis that exctied states of collective bosons do exist and form finite approximately linear trajectories $M_n{}^2(I)$. For the same value of model free parameters no bound or excited fermion states do exist: this provides an example of a mechanism for a fermion confinement. However the fermion excited states do exist for selected other values of model parameters. (6 refs.)

70219 A study of actions with next-to-nearest neighbour interactions in four-dimensional Z_2 gauge theory. G.Bhanot, J.-M.Drouffe, A.Schiller, I.O.Stamatescu (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.67-71 (19 May 1983).
By Monte-Carlo simulation, the authors study a mixed action Z_2 theory in four dimensions. The action has terms involving planar 1×1 and 2×1 Wilson loops. They find a rich phase structure for this model, but no second order transitions. An investigation of a theory with bent 2×1 Wilson loops in the action was also done. This also revealed only first order transition. The models they study have interesting frustrated phases with a strong dependence on the choice of boundary conditions. (6 refs.)

70220 Mean-field analysis of the large-N lattice gauge theory: Wilson action versus Eguchi-Kawai action. H.Hasegawa, Sung-Kil Yang (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.72-6 (19 May 1983).
The large-N Wilson lattice gauge theory and the Eguchi-Kawai model are studied by using the method of the mean field with corrections. The large-N Wilson theory undergoes a first order phase transition in agreement with the Monte Carlo data. The equivalence between the Wilson theory and the EK model in the large-N limit breaks down at the one-loop level in the loop expansion in the weak-coupling region due to the symmetry breaking effect. (13 refs.)

70221 One loop corrections to extended operators on the lattice. G.Martinelli (Lab. Nazionali, INFN, Frascati, Italy), Zhang Yi-Cheng.
Phys. Lett. B (Netherlands), vol.125B, no.1, p.77-80 (19 May 1983).
The authors have computed at first order in perturbation theory the general expressions to establish the relation between lattice one site extended fermion operators (used in recent Monte Carlo simulations) and the corresponding operators in the continuum. (6 refs.)

70222 One-loop renormalization in curved spacetimes using the background-field method. M.Omote, S.Ichinose (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).
Phys. Rev. D (USA), vol.27, no.10, p.2341-7 (15 May 1983).
The renormalizations of various systems in curved spacetimes are discussed. The one-loop counterterm formula for ultraviolet divergence including fermion fields is obtained. By using them, the authors systematically discuss the renormalizability of the pure Yang-Mills field, quantum electrodynamics, and the Yang-Mills field interacting with fermion fields in general curved spacetimes. (11 refs.)

70223 Twisted-Eguchi-Kawai model: a reduced model for large-N lattice gauge theory. A.Gonzalez-Arroyo, M.Okawa (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2397-411 (15 May 1983).
The authors study the large-N reduced model recently proposed by the present authors (1983). This model is a modified version of the Eguchi-Kawai model incorporating twisted boundary conditions. It is shown that the Schwinger-Dyson equations of this model are the same as in the infinite-lattice theory provided $[U(1)]^4$ symmetry is not spontaneously broken. They study the model at strong coupling, weak coupling, and intermediate coupling using analytical and Monte Carlo techniques. At weak coupling, it is shown that for a particular choice of twist, $[U(1)]^4$ symmetry is not broken and they prove how one recovers usual planar perturbation theory. Monte Carlo data for χ ratios show striking agreement with Wilson-theory results. (34 refs.)

70224 Stochastic quantization of matrix and lattice gauge models. A.Guha, S.-C.Lee (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2412-22 (15 May 1983).
The authors introduce a stochastic diffusion equation and the Fokker-Planck equation for various matrix models including the $U(N)\times U(N)$ chiral model and lattice gauge theories. It is shown how to calculate various $U(N)$ integrals using the stochastic equation. In particular, in the external-field problem, the exact large-N result (in the weak-coupling region) is reproduced and a $1/N^2$ correction is computed. Also, the order parameter $\langle \det U\rangle$ is calculated up to order $1/\beta^2$. In the $U(N)\times U(N)$ chiral model, the large-N reduction and quenching is done in the context of stochastic quantization, and the semiclassical results of Bars, Gunaydin, and Yankielowicz (1982) for the free energy and the two-point correlation function are derived. In lattice gauge theory, a very simple way of deriving the complete Schwinger-Dyson equations from the Fokker-Planck equation is demonstrated and, as in the chiral model, a reduced, quenched stochastic equation is derived. (19 refs.)

70225 Constants of motion for the Liouville field theory. A.Kihlberg (Inst. of Theoretical Phys., Chalmers Univ. of Technol., Goteborg, Sweden).
Phys. Rev. D (USA), vol.27, no.10, p.2542-4 (15 May 1983).
Analyzes the general solution of the Liouville equation on periodic two-dimensional spacetime in terms of a set of harmonic oscillators and a 'centre-of-mass motion'. The energy takes a simple form in terms of the associated constants of motion. The obvious Poisson brackets among these latter lead to the correct canonical structure and quantization is discussed. (7 refs.)

70226 Explicit calculation of partition functions for a constant vacuum gauge potential. A.Actor (Dept. of Phys., Pennsylvania State Univ., Fogelsville, PA, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2548-51 (15 May 1983).
The partition function and thermodynamic potential are calculated in arbitrary space-time dimension d for scalar and spinor fields coupled to a constant vacuum gauge potential gA_0 at finite temperature T. For $d=2, 4, 6, \ldots$, closed expressions in terms of Bernoulli polynomials are obtained. This generalizes known results for $d=4$. (15 refs.)

70227 Comments on the non-Abelian Stokes theorem. L.Diosi (Central Res. Inst. for Phys., Budapest, Hungary).
Phys. Rev. D (USA), vol.27, no.10, p.2552-5 (15 May 1983).
Proves the Stokes theorem for non-Abelian gauge fields using general surface coordinates. The result contains both of the known versions of the non-Abelian Stokes theorem and allows one to get a new one which is explicitly invariant under rotations of coordinates. (4 refs.)

70228 Probabilistic interpretation of the dipole ghost models. I.I.Cotaescu (Dept. of Phys., Univ. of Timisoara, Timisoara, Rumania).
Phys. Rev. D (USA), vol.27, no.10, p.2556-8 (15 May 1983).
It is shown that a specific symmetry of the dipole ghost models allows one to derive a good probabilistic interpretation for a particular spin-half model. The arguments given indicate that the interpretation presented holds for any model in which the interaction does not break this symmetry. (6 refs.)

70229 Monte Carlo simulation of SU(2) lattice gauge theory with internal quark loops. V.Azcoiti, A.Nakamura (Istituto Nazionale di Fisica Nucleare, Lab. Nazionali di Frascati, Rome, Italy).
Phys. Rev. D (USA), vol.27, no.10, p.2559-62 (15 May 1983).
Dynamical effects of quark loops in lattice gauge theory with the icosahedral group are studied. The authors employ the standard Wilson action and calculate the fermionic part by a discrete pseudofermionic method. The masses of the π, ρ, and ω are computed and the average value of an effective fermionic action is evaluated. (19 refs.)

70230 Spacelike asymptotic behavior of vacuum expectation values in nonlocal field theory. M.A.Solov'ev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.854-62 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.363-74 (Sept. 1982). [received: May 1983]
A new method is proposed for deriving the cluster decomposition properties of vacuum expectation values in field theories with a mass gap. It is shown that the decomposition property is established with exponential speed for the case of nonlocalizable highly singular fields. The usual Araki-Hepp-Ruelle method (1962) does not apply to such fields. (33 refs.)

70231 Bifurcation of point sources and contour sources of nonlinear fields. O.Sh.Rasizade (Inst. of Phys., Acad. of Sci., Baku, Azerbaidzhan SSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.874-82 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.393-404 (Sept. 1982). [received: May 1983]
The problem of static point sources of a nonlinear scalar field with nonlinearity ϕ^ν (leading term as $|\phi|\to\infty$) in a space of dimension $\gamma\geq 2$ is solved. For $\nu<\nu_c=\gamma/(\gamma-2)$, two different types of point source are found. For $\gamma>2$ when $\nu\geq\nu_c$, there are no point sources. In three-dimensional space, contour sources are possible instead of them. The transition from a distributed sources to a point source when the size of the distributed source tends to zero is also considered. (12 refs.)

70232 Quantum relativistic hydrodynamics of systems with broken symmetry. I. Local-equilibrium state. A.V.Prozorkevich, V.L.Samorodov, S.A.Smolyanskii (Saratov State Univ., Saratov, USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.920-6 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.463-72 (Sept. 1982). [received: May 1983]
The nonequilibrium statistical operator method is used to construct a two-velocity relativistic hydrodynamics model of a quantum-field system with broken symmetry and complex scalar order parameter. The approach is based on model expansions of the operators (the energy-momentum tensor, the current density, etc.) used for statistical description of the system in the hydrodynamic stage. These expansions are used to construct the statistical operator and the thermodynamics of a local-equilibrium state. (17 refs.)

70233 Phase transitions and elementary particle physics. M.Creutz (Brookhaven Nat. Lab., Upton, NY, USA).
Melting, Localization, and Chaos. Proceedings of the Ninth Midwest Solid State Theory Symposium, Argonne, IL, USA, 2-3 Nov. 1981 (New York, USA: North-Holland 1982), p.1-11
Reviews why particle physicists have recently taken an intense interest in the statistical mechanics of certain lattice models. Phase transitions in these systems are of direct relevance to whether the gauge theory of interacting quarks and gluons can prevent the quark as appearing as a free isolated object. Monte Carlo simulation techniques have given the strongest evidence for the confinement phenomenon and are beginning to make numerical predictions in strong interaction physics. (32 refs.)

70234 Charm production and charm decay in left-right (L-R) symmetric models without 'manifest' L-R symmetry. A.Dutta (Jadavpur Univ., Calcutta, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.34
The suggestion that neutrinos are Majorama fermions with ν_R superheavy is attractive since it enables one to construct L-R symmetric gauge models which can accommodate low mass charged and neutral gauge bosons (W_R and Z_R) in the right handed sector. Consistency with observed K_L-K_S mass difference, however, requires models either (i) with a light W_R but strong departure from 'manifest' L-R symmetry ($\theta_L\neq\theta_R$ $\theta\equiv$Cabibbo-like angle) or (ii) with a very heavy W_R. If one allows mixing between W_L and W_R, the situation $C_R\approx 0$ leads to 'Cabibbo favoured' charm production from valence d quarks in ν-hadron scattering. The above qualitative predictions are discussed quantitatively and results are compared with experimental data. (4 refs.)

70235 Systematic derivation of Prasad-Sommerfield solution. M.Sabir, C.M.Ajithkumar (Dept. of Phys., Univ. of Cochin, Cochin, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.45
The authors give a systematic mathematical derivation of the Prasad-Sommerfield one-monopole solution of the 't Hooft-Polyakov equations. They solve these equations in the Prasad-Sommerfield limit using the bilinear operator method and obtain the Prasad-Sommerfield solution. The application of this method to the general problem away from this limit is also discussed.

70236 Exact, multiple soliton solutions of double sine Gordon field equations. B.V.Baby, K.Babu Joseph (Dept. of Phys., Univ. of Cochin, Cochin, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.46
Exact particular solution of the double sine Gordon field equations are constructed in arbitrary dimensions using the method of base equations. N soliton solutions emerge from an application of the base equation approach. These can represent a single soliton in 1+1 dimensions, when the wave vectors are parallel. In the general case the authors show that the number of solitons is restricted to $N<2q-1$, q being the dimension of spacetime. The solutions are found to be stable and localized under collisions.

70237 Confinement in a Bethe-Salpeter model with logarithmic potential. S.H.Biswas, S.R.Choudhury, K.Datta, A.Goyal (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.47
The covariant Bethe-Salpeter (B-S) equation for two scalar quarks confining through a kernel of the form $K\sim\{(p-p')^2\}^{-3/2}$ does possess a discrete spectrum. The kernel $\{(p-p')^2\}^{-3/2}$ is a simple covariant generalization of the log r potential in the 3-dimensional configuration space. To investigate the spectrum an alternative approximation scheme is used to convert the covariant B-S equation to one in a 3-dimensional space. Consistency of the approximation scheme is checked by applying it to the well known Wick-Cutkosky equation where this technique leads to a Balmer type formula, as expected. The resulting Schrodinger-like equation is studied semi-classically: the relativistic effects depress the energy levels.

70238 Two potential electrodynamics for the particles carrying both the electric and magnetic charges. M.P.Benjwal, D.C.Joshi (Dept. of Phys., Garhwal Univ., Garhwal, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.49
Considering the particles carrying both the electric and magnetic charges, the classical electrodynamics for these particles has been developed in terms of two independent four potentials. Considering the electromagnetic fields produced by electric and magnetic charges respectively under strong time reversal, two types of fields are distinguishable and hence two independent field tensors have to be introduced. The expression for the Lagrangian density, energy momentum tensors and equation of motion have been derived in terms of two independent four potentials.

70239 Interaction of particles carrying both the electric and magnetic charges in predictive relativistic mechanics. S.Kumar, D.C.Joshi (Dept. of Phys., Garhwal Univ., Garhwal, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.50
The interaction between dyons of finite mass has been studied in the framework of Predictive Relativistic Mechanics (PRM) by two independent four potentials. The equation of PRM for such interaction have been solved. Representing the acceleration of the system in terms of a power series expression for the acceleration has been obtained up to the first order.

70240 Generalized fields associated with dyons. D.S.Bhakuni, B.S.Rajput (Dept. of Phys., Kumaun Univ., Naini Tal, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.52
In order to avoid the use of arbitrary string variable studies of reduction, second quantization and interaction of the fields associated with dyons of various spins have been carried out by introducing two four-vector potentials. Assuming the generalized charge generalized four-current and generalized four potential associated with dyons as complex quantities with their real and imaginary parts as electric and magnetic constituents respectively, the authors have derived the generalized field equation and equation of motion for the dyon by choosing a suitable Lagrangian density for generalized electromagnetic fields.

11.20 S-MATRIX THEORY

70241 Scattering theory for quantum dynamical semigroups. II. R.Alicki, A.Frigerio (Istituto di Sci. Fisiche, Univ. di Milano, Milano, Italy).
Ann. Inst. Henri Poincare Sect. A (France), vol.38, no.2, p.187-97 (1983).
For pt.I see Z. Phys. A, vol.307, p.149-73 (1982). For a class of quantum dynamical semigroups, the authors prove that the scattering matrix on the space of trace class operators exists and can be uniquely decomposed as the sum of an elastic and an inelastic part, which are separately positive. (11 refs.)

70242 A perturbation theory for long-range interactions of the Coulomb type. A.Soffer (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel).
Lett. Math. Phys. (Netherlands), vol.7, no.2, p.163-9 (March 1983).
The modified free Hamiltonian for the Coulomb interaction is used to derive an equation for the *S*-matrix and renormalized asymptotic states. The author obtains an effective potential and the corresponding finite perturbation expansion for the *S*-matrix. The Born approximation is shown to contain a term $(\alpha/p)\delta^3(p-p')$; the (divergent) phase correction which makes the second-order term finite is also explicitly derived. (9 refs.)

11.30 SYMMETRY AND CONSERVATION LAWS

(see also 02.20 Group theory)

70243 Aspects of supersymmetric quantum mechanics. F.Cooper, B.Freedman (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Ann. Phys. (USA), vol.146, no.2, p.262-88 (1 April 1983).
The authors review the properties of supersymmetric quantum mechanics for a class of models proposed by Witten (1981). Using both Hamiltonian and path integral formulations, they give general conditions for which supersymmetry is broken (unbroken) by quantum fluctuations. The spectrum of states is discussed, and a virial theorem is derived for the energy. The authors also show that the Euclidean path integral for supersymmetric quantum mechanics is equivalent to a classical stochastic process when the supersymmetry is unbroken ($E_0=0$). By solving a Fokker-Planck equation for the classical probability distribution, they find $P_c(y)$ is identical to $|\Psi_0(y)|^2$ in the quantum theory. (13 refs.)

70244 An $SU(2)\otimes U(1)$ model with massive neutrinos and CP violation in the leptonic sector. C.O.Escobar (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil), V.Pleitez.
Ann. Phys. (USA), vol.146, no.2, p.289-308 (1 April 1983).
The authors examine an $SU(2)\times U(1)$ model incorporating massive neutrinos and CP violation for the leptons. The model has Dirac and Majorana mass terms for the neutrinos and two doublets and one triplet of Higgs bosons. They consider the implications of the model for the neutrino oscillations and for the electric dipole moment of the leptons. (37 refs.)

70245 Time-reversal tests in nuclei. F.Boehm (Dept. of Phys., California Inst. of Technol., Pasadena, CA, USA).
Comments Nucl. & Part. Phys. (GB), vol.11, no.6, p.251-7 (1983).
The author outlines the recent progress in establishing upper limits for the amplitude of T-violating couplings, with respect to weak electromagnetic and strong couplings. (19 refs.)

70246 A quark model calculation of the weak parity violating asymmetry in high-energy proton-nucleon scattering. T.Goldman, D.Preston (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.61-83 (9 May 1983).
The authors perform a quark-model calculation of the parity-violating asymmetry in high-energy polarized proton-unpolarized nucleon scattering. Strong interaction enhancement has been taken into account using both renormalization group techniques and precise one-loop calculations. Essential high-twist (bound state) contributions to the asymmetry have been included. The results indicate large ($\sim 10^{-6}$) positive values for the parity-violating asymmetry at high energy, in agreement with the experimental results of Lockyer et al. (1980). (15 refs.)

70247 Lorentz invariance as a low energy phenomenon. S.Chadha (Rutherford Appleton Lab., Chilton, Didcot, England), H.B.Nielsen.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.125-44 (9 May 1983).
It is proposed that the various symmetries observed in nature be regarded as infrared attractive fixed points of a large class of theories which are not endowed with these symmetries a priori. That this hypothesis is feasible is explicitly demonstrated for the case of Lorentz invariance. The strategy is to consider a suitable noncovariant model of electrodynamics, and to show by calculating the relevant β-functions that this model simulates Lorentz invariance better and better as the energy scale is progressively lowered. (16 refs.)

70248 Supersymmetry at finite temperature. T.E.Clark, S.T.Love (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.349-65 (23 May 1983).
Finite-temperature supersymmetry (SUSY) is characterized by unbroken Ward identities for SUSY variations of ensemble averages of Klein-operator inserted imaginary time-ordered products of fields. Path-integral represenations of these products are defined and the Feynman rules in superspace are given. The finite-temperature no-renormalization theorem is derived. Spontaneously broken SUSY at zero temperature is shown not to be restored at high temperature. (12 refs.)

70249 Phase structure of variant action lattice gauge theory by mean field theory with corrections. J.M.Alberty (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark), H.Flyvbjerg, B.Lautrup.
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220 (FS8), no.1, p.61-76 (16 May 1983).
The authors use mean field theory with one-loop corrections to study the phase structure of SU(2) lattice gauge theory with a variant action. In 4d they reproduce the phase diagram found by Bhanot and Creutz (1981) by Monte Carlo methods, including the triple point and the end point of a line of first-order transitions. They predict the phase diagram in 5d with less than 8% error. The role of Z(2) fluxons in the phase transition is elucidated. (25 refs.)

70250 Lie algebras and relativistic wave-equations. C.G.Koutroulos (Dept. of Theoretical Phys., Univ. of St. Andrews, St. Andrews, Scotland).
Fizika (Yugoslavia), vol.15, no.1, p.43-62 (Jan.-March 1983).
Using the methods of Lie algebras the matrices $L_k(k=0,1,2,3)$, appearing in the Bhabha wave-equation on the 16 and 20-dim representations of the group SO (4,1) are given as linear combinations of the basis elements of the Lie algebra B_2. The hermitianizing matrix is also constructed and the masses of the particles determined. Finally the transformation properties of the hermitianizing matrix are studied. (28 refs.)

70251 Some double-valued representations of the linear groups. Y.Ne'eman (Wolfson Chair Extraordinary of Theoretical Phys., Tel Aviv Univ., Tel Aviv, Israel).
Found. Phys. (USA), vol.13, no.4, p.467-80 (April 1983).
The author reviews the mathematical theory of SL(n,R) and its double-covering group $\overline{\text{SL}}$(n,R), especially for n=2, 3, 4. After discussing a variety of physical applications, the author shows that $\overline{\text{SL}}$(3,R) provides holonomic curved space ('world') spinors with an infinite number of components. The author constructs the relevant holonomic 'manifield' and discusses the gravitational interaction of a proton as an example. (41 refs.)

70252 Kronecker products for compact semisimple Lie groups. G.R.E.Black (Phys. Dept., Univ. of Canterbury, Christchurch, New Zealand), R.C.King, B.G.Wybourne.
J. Phys. A (GB), vol.16, no.8, p.1555-89 (1 June 1983).
A review is given of the application of *S*-function techniques to the evaluation of Kronecker products of irreducible representations of compact semisimple Lie groups. Explicit formulae are derived for all irreducible representations of all such groups. Recent developments involving composite Young diagrams are brought to fruition and the vexed problem of SO_{2k} is dealt with completely. New branching rules for the classical groups are given in an appendix. These are exploited in the evaluation of Kronecker products by means of a technique which is applied to both classical and exceptional groups. A discussion is made of various modification rules which are needed to express the final results in standard form. (56 refs.)

70253 Scalar factors for non-canonical subgroup restriction of unitary group. R.S.Nikam, G.G.Sahasrabudhe, C.R.Sarma (Dept. of Phys., Indian Inst. of Technol., Bombay, India).
J. Phys. A (GB), vol.16, no.8, p.1591-601 (1 June 1983).
A procedure has been outlined for obtaining the scalar factors (reduced Wigner coefficients) of the unitary group $U(nm)\supset U(n)\otimes U(m)$. This has been done at the permutation group level for $S_N\downarrow S_{N'}\otimes S_{N''}$ and the equality between the scalar factors of these two groups has been exploited. It has been shown that the scalar factors can be uniquely expressed in terms of the inner and outer product coupling coefficients of the permutation group. The ambiguity due to multiplicity is resolved at the level of the above coefficients. (17 refs.)

70254 Spatial rotations, electromagnetic gauge transformations and the fine-structure constant. G.Rosen (Dept. of Phys., Drexel Univ., Philadelphia, PA, USA).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.2, p.48-50 (14 May 1983).
The fine-structure constant may signify an underlying relationship between the associated groups for spatial rotations SO_3 and electromagnetic gauge transformations SO_2. The author considers the Haar-induced volumes of the four- and ten-dimensional envelopments $\epsilon(SO_3{*}SO_2)$ and $\epsilon[(SO_3)^3{*}SO_2]$, and determines the theoretical value of the fine-structure constant required. (2 refs.)

70255 Supersymmetry at finite temperature revisited. M.B.Paranjape (Dept. of Phys., MIT, Cambridge, MA, USA), A.Taormina, L.C.R.Wijewardhana.
Phys. Rev. Lett. (USA), vol.50, no.18, p.1350-3 (2 May 1983).
The authors have formulated supersymmetry at finite temperature, generalizing the recent observations by Van Hove. They find that in a two-dimensional model broken supersymmetry is not restored at high temperature. (9 refs.)

70256 Sypersymmetric phase transition. P.N.Pandita (Dept. of Phys., North-Eastern Hill Univ., Shillong, India), S.Singh.
Phys. Rev. Lett. (USA), vol.50, no.20, p.1550-2 (16 May 1983).
The existence of a second-order phase transition associated with spontaneous supersymmetry breaking in a prototype globally supersymmetric model with a conserved fermion number is demonstrated. The model is solved exactly and it is shown that one of the superfields develops a vacuum expectation value below a critical temperature and that the ground-state energy is nonzero. (11 refs.)

70257 General results on the low energy effective theory for $N=1$ local supersymmetry. R.Gatto (Dept. de Phys. Theorique, Univ. de Geneve, Geneva, Switzerland), G.Sartori.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.333-6 (5 May 1983).
Examines the structure of the recent supersymmetric $N=1$ models in which supersymmetry is spontaneously broken through a gravitational superhiggs effect leading to soft supersymmetry breaking in the low energy effective theory. Under the additional assumption of scale invariance for the low energy superpotential the authors find a general class of negative energy extrema (parallel solutions) which correspond to extrema of the modulus of the superpotential on a unit sphere. Such solutions allow for characteristic scalars at mass values independent of the superpotential, reflecting original dilation and U(1) invariances. Other massive scalars have masses related to the gauge boson masses. (3 refs.)

70258 Chiral properties of supersymmetric vacua. G.Veneziano (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.357-61 (5 May 1983).
Arguments suggesting that chirality is (at least partly) unbroken in a class of gauge theories with exact or softly broken supersymmetry hint at the possible relevance of such theories for constructing composite models of quarks and leptons. (15 refs.)

70259 Fermi-Bose symmetry and Kahler fields. I.M.Benn, R.W.Tucker (Dept. of Phys., Univ. of Lancaster, Lancaster, England).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.47-8 (19 May 1983).
The authors formulate a supersymmetric model in terms of Kahler fields, and comment on the nature of the symmetry viewed in this perspective. (14 refs.)

70260 On dynamical supersymmetry breaking by chiral condensates. U.Ellwanger (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.54-8 (19 May 1983).
The renormalization of Green functions of composite chiral superfields is investigated. The author shows that the solution of the renormalization group equation for the corresponding generating functional does not allow for supersymmetry breaking vacuum expectation values. (15 refs.)

70261 A geometric hierarchy for the supersymmetry-breaking scale. C.Oakley (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England), G.G.Ross.
Phys. Lett. B (Netherlands), vol.125B, no.1, p.59-62 (19 May 1983).
The authors consider F type supersymmetry breaking through O'Raifeartaigh-Fayet potentials. It is shown how a class of models gives rise to a supersymmetry breaking scale reduced relative to the fundamental scale M of the potential by powers of (M/M_{Planck}). The role of R invariance in such potentials is discussed. (12 refs.)

70262 Invisible axions in supersymmetric SU(N). P.H.Frampton (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA), T.Matsuki, W.W.Wada.
Phys. Rev. D (USA), vol.27, no.9, p.2204-10 (1 May 1983).
The strong *CP* problem and the possible Peccei-Quinn symmetry is discussed in a 'natural' supersymmetric SU(N) for N=5, 6, 7, 8 and 9. The authors also show that the R symmetry cannot be the Peccei-Quinn U(1) symmetry. (26 refs.)

70263 Extended supersymmetry in five dimensions with central charges. J.Lukierski (Dept. de Phys. Theorique, Univ. de Geneve, Geneve, Switzerland), L.Rytel.
Phys. Rev. D (USA), vol.27, no.10, p.2354-8 (15 May 1983).
The extended $D=5$ super-Poincare algebra with $4N$ complex spinorial charges and maximal number of $2N^2\text{-}N$ central charges is introduced. The generators of central charges are obtained by the contraction of $SU(2,2;2N)$ superalgebras. The possible reductions of internal-symmetry $Sp(n)\equiv U(n;H)$ due to the presence of central charges are given. The additional $2N^2\text{-}N$ bosonic degrees of freedom defining $D=5$ extended superspace are introduced. (18 refs.)

70264 Effective-potential study of symmetry breaking in scalarless SU(2)×U(1). K.T.Mahanthappa, J.Randa (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2500-30 (15 May 1983).
The authors derive the effective potential as a functional of composite operators for massless, scalarless SU(2)×U(1); and they obtain conditions under which this effective potential is the vacuum energy density for the case of composite operators which are nonlocal in time. General considerations of the number of Goldstone bosons prevent the construction of a realistic model, but they are able to study dynamical symmetry breaking for various unrealistic spectra of physical particles. They first use the standard linearized approximation (LA) to solve the equations obtained for the propagators from the effective potential, and we compare these results to the most-attractive-channel hypothesis. These LA solutions reproduce the standard vector-boson mixing and in addition yield a (reasonable) relation between the vector masses and those of the fermions. However, the linearized equations are also satisfied by the symmetric (massless) solution. In order to determine which solution corresponds to the true vacuum, they use the effective potential in a variational calculation. The linearized-approximation solutions are used to determine the functional forms of the propagators, and the physical masses are treated as variational parameters in minimizing the effective potential. In an Abelian approximation, in which the effects of the vector self-couplings are absent, the mass relations of the LA survive the inclusion of nonlinear effects. On the other hand, if a Hartree-Fock approximation is used for the vector self-couplings, all the desirable features of the LA are lost: The breaking is no longer $I={}^1/_2$, and the relation between vector and fermion masses requires fermions much heavier than the vectors (or very large numbers of lighter fermions). In either approximation, whether spontaneous symmetry breaking occurs depends on the number and quantum numbers of the fermions. Significance of the results and possible future directions are discussed. (27 refs.)

70265 Dynamical symmetry breaking in $SU(2)_L{\times}SU(2)_R{\times}U(1)$. J.Randa (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2531-40 (15 May 1983).
Results of weak-coupling approach to dynamical symmetry breaking within $SU(2)_L{\times}SU(2)_R{\times}U(1)$ are presented. The mixing of the neutral vector bosons is wrong, and a simple reason for this failure is given. (11 refs.)

11.50 DISPERSION RELATIONS AND SUM RULES

70266 The non-perturbative parameter in the SVZ sum rules cannot be $\langle 0|(\alpha_s/\pi)G_{a\mu\nu}G_a^{\mu\nu}|0\rangle$. A.Zalewska, K.Zalewski (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.89-91 (19 May 1983).
New data on the Υ family and the SVZ sum rules are used to evaluate the parameter usually interpreted as $\langle 0|(\alpha_S/\pi)G_{a\mu\nu}G_a^{\mu\nu}|0\rangle$. The results exceeds by almost two orders of magnitude that accepted for the ψ family. This excludes the now standard interpretation. (15 refs.)

70267 Strong anomaly, spectral-density sum rules, and broken $U(3)\times U(3)$ symmetry. S.Debnath (Dept. of Theoretical Phys., Indian Association for the Cultivation of Sci., Calcutta, India), B.Bagchi.
Phys. Rev. D (USA), vol.27, no.9, p.2231-4 (1 May 1983).
The authors obtain, by making use of the anomaly term in the divergence of the flavor-singlet axial-vector-current, new spectral-function sum rules for the pseudoscalar density in a chiral-$SU(3)\times SU(3)\times U_3(1)$ framework. The positivity conditions on the spectral representations of the pseudoscalar densities lead to a new bound on the quark-condensate term $\langle 0|\bar{q}q|0\rangle\leq-(279\text{ MeV})^3$ ($q=u$, d, and s) corresponding to bare-current-quark values of $m_u=m_d\approx 5$ MeV and $m_s\approx 150$ MeV. 12.00 SPECIFIC THEORIES AND INTERACTION MODELS; PARTICLE SYSTEMATICS

12.10 UNIFIED FIELD THEORIES AND MODELS

70268 Cosmological character of the Higgs field. A.Okopinska (Inst. of Phys., Warsaw Univ., Bialystok, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.4, p.235-8 (April 1983).
The Higgs-boson mass in the Weinberg-Salam electroweak theory $M_H=6.6$ GeV is obtained from the experimental limits on the value of the cosmological constant. (10 refs.)

70269 Monopoles underground. J.A.Harvey (Princeton Univ., Princeton, NJ, USA).
AIP Conf. Proc. (USA), no.96, p.299-305 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
A new bound on the product of the galactic flux of monopoles and the cross section for monopole catalyzed nucleon decay, $(F_M/\text{cm}^{-2}\text{ sr}^{-1})$ $(\sigma_{\Delta B}/10^{-27}\text{ cm}^2)\leq 10^{-22}$, and its implications for the detection of monopoles are discussed. (12 refs.)

70270 Thoughts on family symmetries. F.Wilczek (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).
AIP Conf. Proc. (USA), no.96, p.313-17 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
Advantages accruing to theories with spontaneous breakdown of flavor symmetries are reviewed. A possible experimental signature in rare K decays is discussed. One particularly attractive breakdown scheme is pointed out. The history of the U(1) problem is briefly discussed, including recent ideas regarding axions. The relevance of Cavendish-type experiments in testing for axions and familons is mentioned. (1 ref.)

70271 Searches for rare decays of the muon and for μe conversion as experimental tests of muon number conservation. D.E.Nagle (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Comments Nucl. & Part. Phys. (GB), vol.11, no.6, p.277-86 (1983).
A brief overview is presented of the present experimental situation regarding sensitive tests of muon-electron number conservation, together with some salient implications. (16 refs.)

70272 The strangeness-conserving effective weak interaction in the quark basis. D.Preston, T.Goldman (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.31-60 (9 May 1983).
Strong interaction corrections to the Glashow-Salam-Weinberg model of electroweak interactions are studied, for the up and down quarks only, to all orders of leading logarithms using renormalization-group techniques. The resulting quark effective weak Hamiltonian is explicitly written out in a form convenient for obtaining matrix elements. The accuracy of this result is estimated by a comparison with finite, one-loop calculations of parity-violating parts of the interaction. (24 refs.)

70273 Do 'tHooft anomaly equations know about Georgi-Glashow grand unification?. A.Davidson, J.Sonnenschein (Dept. of Nuclear Phys., Weizmann Inst. of Sci., Rehovot, Israel).
Phys. Rev. Lett. (USA), vol.50, no.18, p.1339-42 (2 May 1983).
The embedding of $SU(k)_{HC}$ composite schemes within flavor-chiral color-asymptotically-free $SU(N)$ grand unifying theories is examined. It is shown that unless $k=3$, the associated spectator-composite structure conspires to be real under the residual gauge interactions. The exceptional n-preon $SU(3)_{HC}$ scheme is capable of supporting a non-exotic quark/lepton spectrum only if $n=4,5$. The SU(8)-embeddable $n=5$ case leads to a multigenerational Georgi-Glashow SU(5) picture. (17 refs.)

70274 Experimental test of baryon conservation: a new limit on neutron-antineutron oscillations in oxygen. M.L.Cherry, K.Lande, C.K.Lee, R.I.Steinberg (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA).
Phys. Rev. Lett. (USA), vol.50, no.18, p.1354-6 (2 May 1983).
The paper reports the result of a search for baryon-number-nonconserving neutron-antineutron transitions in oxygen using a 300-ton water Cherenkov detector located in the Homestake gold mine at a depth of 4200 meters of water equivalent. The 90%-confidence-level upper limit for the neutron-antineutron oscillations in oxygen, this result corresponds to a lower limit on the free-neutron oscillations time of 2×10^7 sec. (18 refs.)

70275 Constraint on the photino mass from cosmology. H.Goldberg (Dept. of Phys., Northeastern Univ., Boston, MA, USA).

Phys. Rev. Lett. (USA), vol.50, no.19, p.1419-22 (9 May 1983).

A lower bound for the photino mass $m_{\tilde{\gamma}}$ as a function of the spin-0 fermion superpartner mass m_{f} is derived as an extension of the calculation of Lee and Weinberg. The Majorana nature of the photino induces a *p*-wave threshold for annihilation $\tilde{\gamma}\tilde{\gamma}\to f\bar{f}$ into light fermions, and leads to a rather unexpected form for the bound: for 25 GeV $\lesssim m_{\mathrm{f}} \lesssim 45$ GeV, $(m_{\tilde{\gamma}})_{\min} \simeq m_{\tau} = 1.8$ GeV; for $m_{\mathrm{f}} > 45$ GeV, $(m_{\tilde{\gamma}})_{\min}$ increases approximately linearly with m_{f} to a value of 20 GeV when $m_{\mathrm{f}} = 100$ GeV. (17 refs.)

70276 Majorana neutrinos and the production of the right-handed charged gauge boson. W.-Y.Keung, G.Senjanovic (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).

Phys. Rev. Lett. (USA), vol.50, no.19, p.1427-30 (9 May 1983).

A possibility of a very clean signature for the production of ${W_{\mathrm{R}}}^{\pm}$ is pointed out. If the right-handed neutrino is lighter than ${W_{\mathrm{R}}}^{\pm}$, left-right symmetric gauge theory predicts the decay ${W_{\mathrm{R}}}^{+} \to \mu^{+}\mu^{+} + 2$ hadronic jets, with the branching ratio $\simeq 3\%$. The lack of neutrinos in the final state and the absence of a sizable background make ${W_{\mathrm{R}}}^{\pm}$ rather easy to detect (if it exists). Detailed predictions regarding the production and decay rates of ${W_{\mathrm{R}}}^{+}$ are presented. (9 refs.)

70277 Monopole topology and the problem of colour. A.P.Balachandran, G.Marmo, N.Mukunda, J.S.Nilsson, E.C.G.Sudarshan, F.Zaccaria (Dept. of Phys., Univ. of Texas, Austin, TX, USA).

Phys. Rev. Lett. (USA), vol.50, no.20, p.1553-5 (16 May 1983).

Topological obstructions to the definition of unbroken-symmetry transformations in the presence of monopoles with non-Abelian flux are exposed. Consequences for colour and electroweak SU(2) in the context of the SU(5) model are discussed. (10 refs.)

70278 Gauge hierarchy generation and cosmology in locally supersymmetry GUTS. D.V.Nanopoulos, K.A.Olive, M.Srednicki (CERN, Geneva, Switzerland), K.Tamvakis.

Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.171-4 (28 April 1983).

The authors discuss a locally supersymmetric GUT with no unnaturally small couplings and just two input mass scales $M_{\mathrm{P}} \approx 10^{19}$ GeV and $\mu \approx 10^{19}$ GeV. They get out both the weak scale $M_{\mathrm{W}} \approx \mu^{2}/M_{\mathrm{P}}$ and the GUT scale $M_{\mathrm{X}} \approx (\mu M_{\mathrm{P}})^{1/2}$. The model produces an acceptable cosmological scenario similar to the one they have previously discussed for globally supersymmetric GUTs. (32 refs.)

70279 Inverted hierarchy and asymptotic freedom in grand unified supersymmetric theories. H.Aratyn (Phys. Dept., Tech.-Israel Inst. of Technol., Haifa, Israel), M.Moshe.

Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.175-9 (28 April 1983).

The interrelation between an inverted hierarchy mechanism and asymptotic freedom in supersymmetric theories is analyzed in two models for which the authors performed a detailed analysis of the effective potentials and effective couplings. They find it difficult to accommodate an inverted hierarchy together with asymptotic freedom for the matter-Yukawa couplings. (14 refs.)

70280 Unification incorporating observable fractional charge, magnetic monopole and maphon. S.Aoyama (Fachbereich Phys., Gesamthochschule Wuppertal, Wuppertal, Germany), Y.Fujimoto, Zhao Zhiyong.

Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.185-91 (28 April 1983).

The authors discuss the possibility of grand unification which incorporates both observable fractional charge and magnetic monopole under the assumption that there exists an undiscovered exact local U(1) symmetry. (11 refs.)

70281 The fine-tuning problem in renormalized perturbation theory: spontaneously-broken gauge models. O.E.Foda (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA).

Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.192-6 (28 April 1983).

Studies the stability of tree-level gauge hierarchies at higher orders in renormalized perturbation theory, in a model with spontaneously-broken gauge symmetries. The author confirms previous results indicating that if the model is renormalized using BPHZ, then the tree-level hierarchy is not upset by the radiative corrections. Consequently, no fine-tuning of the initial parameters is required to maintain it, in contrast to the result obtained using dimensional renormalization. This verifies the conclusion that the need for fine-tuning, when it arises, is an artifact of the application of a certain class of renormalization schemes. (17 refs.)

70282 On the gravitational interaction of a massless spin-5/2 particle. K.Shima (Inst. for Theoretical Phys., Univ. of Karlsruhe, Karlsruhe, Germany).

Phys. Lett. B (Netherlands), vol.124B, no.5, p.321-3 (5 May 1983).

A nonminimal gravitational gauge coupling of massless spin-5/2 particle is studied, where curvatures are constrained but nontrivial. (7 refs.)

70283 An inflationary model without fine-tuning or supersymmetry. M.Sher (Dept. of Phys., Univ. of California, Irvine, CA, USA).

Phys. Lett. B (Netherlands), vol.124B, no.5, p.329-32 (5 May 1983).

An SU_5 model with a fundamental scale *M* and an additional $5+\bar{5}$ of fermions will, for a range of values of the Yukawa coupling, develop a second, deeper asymmetric minimum at a scale $\gg M$ due to radiative corrections. If the latter minimum is 10^{15} GeV, the fundamental scale could be quite small. This potential is discussed in some detail, and it is shown that the transition from the first asymmetric vacuum at $\phi \sim M$ to the second at $\phi \sim 10^{15}$ GeV will be inflationary if $M \lesssim 10^{11}$ GeV. This model will then be an inflationary model with similar phenomenology to Coleman-Weinberg inflation, but without fine-tuning. (20 refs.)

70284 Light singlet, gauge hierarchy and supergravity. A.B.Lahanas (CERN, Geneva, Switzerland).

Phys. Lett. B (Netherlands), vol.124B, no.5, p.341-4 (5 May 1983).

The existence of light singlets to help the breaking of SU(2)×U(1) in supersymmetric grand unified theories destroys the gauge hierarchy. The phenomenon exists for both global and local SUSY-GUT models. (10 refs.)

70285 Flavor changing neutral currents and $\Delta S=2$ transitions in the hypercolor scenario. M.A.B.Beg (Rockefeller Univ., New York, NY, USA).

Phys. Lett. B (Netherlands), vol.124B, no.5, p.403-6 (5 May 1983).

Considers the problem of flavor changing neutral currents (FCNCs) in a hypercolor-based scenario for dynamical symmetry breaking. Within the framework of a simplified model the author focuses on a part of the $\Delta S=2$ amplitudes hitherto considered dangerous, and show that it is subject to a measure of natural suppression, via a GIM-like mechanism herein called pseudo-GIM. Furthermore, this part depends on angles which cannot be determined, directly, from low energy experiments and which may—in the present state of the art—be regarded as adjustable parameters. The FCNC problem, of hypercolor, thus largely reduces to a non-problem. The author also notes that the failure of two groups at PETRA to observe very light pseudoGoldstone bosons is a non-problem as well. Present phenomenology therefore fails to provide any credible evidence that may be used in reaching a verdict on hypercolor; until higher energy machines go into operation one must either reserve judgement or appeal to aesthetic criteria. (7 refs.)

70286 On the calculability of ${\mathrm{W}_{\mathrm{L}}}^{+}$-${\mathrm{W}_{\mathrm{R}}}^{+}$ gauge mixing. G.C.Branco (Dept. de Phys. Theorique, Univ. de Geneve, Geneva, Switzerland), J.-M.Gerard.

Phys. Lett. B (Netherlands), vol.124B, no.5, p.415-20 (5 May 1983).

The authors investigate the conditions which must be satisfied in order for ${\mathrm{W}_{\mathrm{L}}}^{+}$-${\mathrm{W}_{\mathrm{R}}}^{+}$ gauge mixing to be a calculable quantity. In particular a model independent necessary constraint involving fermion mass matrices is derived. (12 refs.)

70287 An SU(3) model for electroweak unification. M.Singer, R.Parthasarathy, K.S.Viswanathan (Dept. of Phys., Simon Fraser Univ., Burnaby, BC, Canada).

Phys. Lett. B (Netherlands), vol.125B, no.1, p.63-6 (19 May 1983).

The authors present a model of electroweak unification based on the group SU(3). They reproduce the standard SU(2)×U(1) effective interactions with $\sin^{2}\theta_{\mathrm{W}} = 1/4$. None of the gauge bosons need acquire a large mass in order to suppress unwanted interactions. (9 refs.)

70288 Monopole catalysis of proton decay in SO(10) grand unified models. S.Dawson, A.N.Schellekens (Fermi Nat. Accelerator Lab., Batavia, IL, USA).

Phys. Rev. D (USA), vol.27, no.9, p.2119-28 (1 May 1983).

The authors construct the monopole spectrum in an SO(10) grand unified theory which has an arbitrary pattern of symmetry breakdown to $\mathrm{SU}(3)\times\mathrm{U}(1)_{\mathrm{EM}}$. They show that if the fermion fields are in a $\underline{16}$ of SO(10), then it is impossible to find an SO(10) theory where monopoles do not catalyze proton decay. Furthermore, the branching ratios for monopole-catalyzed proton decay are identical in SO(10) and SU(5) grand unified theories. The authors also present a criterion for constructing grand unified theories which do not have monopole catalysis of proton decay. (19 refs.)

70289 Hyperleptonic generations in unifying schemes. A.Davidson, J.Sonnenschein (Dept. of Nuclear Phys., Weizmann Inst. of Sci., Rehovot, Israel).

Phys. Rev. D (USA), vol.27, no.9, p.2199-203 (1 May 1983).

It is shown that the requirement of having a fully spectator N_{g}-dimensional generation structure, in the presence of a confining $\mathrm{Su}(n)_{\mathrm{HC}}$ interaction, can be fulfilled in a conventional SU(*N*) grand unified manner only provided $n = N_{\mathrm{g}} = 3$. A possible origin for the exclusive smallness of m_{u}, m_{d}, and m_{s} is then suggested by the global group-theoretical properties of the associated fermionic representation. The price of such a hyperleptonic scenario is briefly discussed. (9 refs.)

70290 Cosmological-type constant derived in a unified field theory. R.T.Hammond (Dept. of Phys. & Astron., Vassar Coll., Poughkeepsie, NY, USA).

Phys. Rev. D (USA), vol.27, no.10, p.2535-7 (15 May 1983).

It is shown that in a unified theory of gravitation and electromagnetism a constant electromagnetic potential contributes to the curvature of spacetime and in so doing acts much like a cosmological constant. (1 ref.)

70291 Supersymmetric grand unified theories and cosmology. G.Lazarides (Rockefeller Univ., New York, NY, USA), Q.Shafi.

Phys. Rev. D (USA), vol.27, no.10, p.2538-41 (15 May 1983).

By examining the behavior of supersymmetric grand unified theories (GUT's) in the very early Universe the authors find two classes of realistic models. In one of them supersymmetry is broken at or near the superheavy GUT scale. The cosmological implications of such models are expected to be similar to those of nonsupersymmetric GUT's. In the second class of models, the superheavy GUT scale is related to the supersymmetry-breaking scale in the manner of Witten (1981). Two types of cosmological scenarios appear possible in this case, either with or without an intermediate (new) inflationary phase. They can be experimentally distinguished, since the former predicts an absence and the latter an observable number density of superheavy monopoles. A mechanism for generating baryon asymmetry in such models is pointed out. (17 refs.)

70292 A new method for flavor unifications. Ngee-Pong Chang (Dept. of Phys., City Coll., City Univ. of New York, New York, NY, USA), Xue Peiyou, Zhou Xianjian.

Sci. Sin. (China), vol.26, no.4, p.412-17 (April 1983).

Chiral symmetry is used to unify flavours in grand unified theories which can deal with real representations of fermions as well as complex representations of fermions. As an example, an *SO*(16) model is constructed which can accommodate four usual generations with left-handed charged weak currents and four generations with right-handed charged weak currents. (9 refs.)

70293 Hydrogen-antihydrogen oscillations in a fractionally charged Pati-Salam model. B.B.Deo, K.Maharana (Dept. of Phys., Utkal Univ., Bhubaneswar, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.30

Choosing the set of antisymmetric sixplet of Higgs mesons in a fractionally charged quark $\mathrm{SU}(4)\times\mathrm{SU}(2)_{\mathrm{L}}\times\mathrm{SU}(2)_{\mathrm{R}}$ gauge model hydrogen-antihydrogen oscillations are analysed. Results turn out to be similar to those obtained by Mahapatra and Sanjanovic with the choice of symmetric Higgs mesons, but neutrinoless double beta decay and muonium-antimuonium transition rates are found to be negligible.

70294 n-n̄ oscillation, H-H̄ oscillation and the double proton decay—are they suppressed by wave function effects?. S.P.Misra, U.Sarkar (Inst. of Phys., Bhubaneswar, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.31

The authors discuss here the substantial corrections arising due to the wave function effects in some standard calculations of matter instability involving n-n̄ oscillation, H-H̄ oscillation and double proton decay. The corrections result from a more fastidious evaluation of the matrix elements and enhance stability of matter against oscillations.

70295 Three lepton decay of proton in a fractionally charged quark $\mathbf{SU(4)\times SU(2)_{L}\times SU(2)_{R}}$ model. B.B.Deo, K.Maharana (Dept. of Phys., Utkal Univ., Bhubaneswar, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.32

An interesting three leptonic decay mode of proton is analysed in a fractionally charged quark $\mathrm{SU}_{\mathrm{C}}(4)\times\mathrm{SU}(2)_{\mathrm{L}}\times\mathrm{SU}(2)_{\mathrm{R}}$ Pati-Salam type of model. With a quark lepton unification mass of about 10^{5} GeV and reasonable values for the colored Higgs mass, the lifetime of proton turns out to be of the order of 10^{31} years.

70296 Double-equivalent photon approximation for processes with massive vector particles. T.Jayaraman, G.Rajasekaran, S.D.Rindani (Dept. of Theoretical Phys., Univ. of Madras, Madras, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.42
The authors show that in the process $e^+e^- \rightarrow e^+e^-\gamma^*\gamma^* \rightarrow e^+e^-V^+V^-$ where V is a massive vector particle with point-like Yang-Mills coupling to the photon, the equivalent-photon approximation is strictly valid only when $|k_1^2||k_2^2| \ll {}^m V^8/M^4$ and $|k_1^2| \ll m_V^2$, $|k_2^2| \ll m_V^2$ (where m_V is the mass of V, M the invariant mass of V^+V^- and k_1 and K_2 the four-momentum of the two virtual photons). They demonstrate the process $e_R^-e_L^+ \rightarrow e_L^+e_L^-W^+W^-$ in the Weinberg-Salam model.

70297 A modification of the equivalent photon approximation for processes with massive vector particles. T.Jayaraman, G.Rajasekaran, S.D.Rindani (Dept. of Theoretical Phys., Univ. of Madras, Madras, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.43
The authors show that in the process $\gamma e \rightarrow \gamma\gamma^* e \rightarrow eV^+V^-$ where V is a massive vector particle (of mass m_V) with pointlike Yang-Mills coupling to the photon, the equivalent-photon approximation is strictly valid only when $|k^2| \ll m_V^2$, k is the four-momentum of the virtual photon γ^*. A new approximation is described where in this constraint on $|k^2|$ can be removed. They demonstrate the method for the process $\gamma e_R^- \rightarrow e_R^-W^+W^-$ in the Weinberg-Salam model.

70298 Gauge fields, BRS symmetry and the Casimir effect. J.Ambjorn, R.J.Hughes (California Inst. of Technol., Pasadena, CA, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.336-48 (23 May 1983).
The canonical quantization of the photon field in covariant gauge is studied in the presence of static boundaries, on which the field satisfies either 'bag' or superconductor boundary conditions. The inclusion of the Fadeev-Popov ghost fields is found to be essential for agreement with Coulomb gauge calculations of the Casimir energy. (21 refs.)

70299 On a construction of the *S*-matrix in QED. G.Scharf (Inst. fur Theoretische Phys., Univ. Zurich, Zurich, Switzerland).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.3, p.302-24 (1 April 1983).
The construction proceeds in three steps: At first the electron-positron field is quantized in a fixed *C*-number potential *A* (external-field problem). The corresponding *S*-operator is uniquely determined up to a phase depending on *A*. The second step is the construction of this phase by using causality. Finally, the full *S*-matrix is obtained by functional integration over *A*. The steps are carefully done in order to avoid divergences. (12 refs.)

70300 Quasiclassical approach to the high-energy Delbruck scattering. A.I.Mil'shtein, V.M.Strakhovenko (Inst. of Nuclear Phys., Novosibirsk, USSR).
Phys. Lett. A (Netherlands), vol.95A, no.3-4, p.135-8 (25 April 1983).
A quasiclassical approach intended for description of the quantum electrodynamics processes in the Coulomb field at high energies is developed. An expression of the high-energy Delbruck scattering amplitude is derived in a simple form, thereby allowing the authors to define the dependence of the total cross section on the charge of the Coulomb centre. (8 refs.)

70301 String operator expansion of the T product of two currents near the light cone. I.I.Balitsky (Leningrad Nuclear Phys. Inst., Leningrad, USSR).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.230-6 (28 April 1983).
The local operators in the Wilson expansion are shown to group in straight-line string operators. The expansion in string operators enables the author to obtain the twist-four contribution to the T product, which is rather difficult with conventional techniques. The well-known logarithmic corrections to scaling are also obtained from the expansion. (14 refs.)

70302 A calculation of the electromagnetic vacuum polarization in lattice QCD. A.Ali (DESY, Hamburg, Germany), I.Montvay.
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.237-42 (28 April 1983).
The authors present a calculation of the electromagnetic current vacuum polarization in the framework of lattice QCD. A 16th order hopping-parameter expansion of $\langle J_\mu^{em} J_\mu^{em}\rangle_0$ is reported on an 8^4 lattice. It gives a reasonable description of the mass $m_{J/\psi}$ and the electromagnetic current-vector meson coupling constant $f_{J/\psi}$, in the vector meson dominance approximation. (13 refs.)

70303 Fermion-monopole system reexamined. H.Yamagishi (Dept. of Phys., Princeton Univ., Princeton, NJ, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2383-96 (15 May 1983).
The problem of a Dirac particle in a fixed Abelian monopole field is reexamined. The author finds that the boundary conditions adopted by Kazama, Yang, and Goldhaber (1977) can be generalized. When the generalization is made, the author is led to the existence of θ vacua. For massless fermions, chiral symmetry is spontaneously broken. A change in θ is equivalent to a chiral rotation, and the physics is independent of θ. For massive fermions, *CP* invariance is broken except for $\theta=0$, π. The vacuum charge for a unit pole obeys the Witten formula $Q=-e\theta/2\pi$ and the monopole becomes a dyon. The results for the two cases are related by an analog of Levinson's theorem (1949, 1952). The author also notes the connection of these results with fractional quantum numbers on solitons, and with the η invariant of Atiyah, Patodi, and Singer (1973). (55 refs.)

70304 Dual symmetry in classical and quantum spin theory. V.A.Bordovitsyn, S.V.Sorokin (Lenin Komsomol Tomsk Teaching Inst., USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.632-4 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.56-9 (July 1982). [received: May 1983]
Apropos the continuing discussion of the observability of the magnetic charge (the Dirac monopole), there is interest in investigating the dual symmetry of the spin equations of motion in classical and quantum theory. It is known that in dual symmetry theory the presence of a magnetic charge is a simple consequence of the dual invariance of the equations of electrodynamics (Strashev et al. 1975). The matter of the observability of a magnetic charge is not tackled there, and becomes only 'experimentally verifiable'. (11 refs.)

12.30 MODELS OF WEAK INTERACTIONS

70305 On some tests of the basic properties of the neutral weak interaction. I. With massless neutrinos. G.V.Dass, P.Ram Babu (Dept. of Phys., Indian Inst. of Technol., Bombay, India).
Ann. Phys. (USA), vol.146, no.2, p.395-410 (1 April 1983).
The authors consider the Born approximation scattering, by electrons, of neutrinos (and antineutrinos) of the muon and of the electron types; the general Lagrangian respecting lepton locality is used. Throughout, they study only differential cross sections as the experimental observables. Some tests previously proposed for 'neutrino identity' or Lorentz structure of the neutral weak interaction are reexamined. The existence in $\nu_e e^-$ and $\bar{\nu}_e e^-$ scattering of interference between neutral currents and the (V-A) charged current is investigated with and without μe universality. The threat to lepton locality of lack of enough events for $\bar{\nu}e^-$ or νe^- scattering is also considered. (16 refs.)

70306 On some tests of the basic properties of the neutral weak interaction. II. With massive neutrinos. G.V.Dass, P.Ram Babu (Dept. of Phys., Indian Inst. of Technol., Bombay, India).
Ann. Phys. (USA), vol.146, no.2, p.411-18 (1 April 1983).
For pt.I see ibid., vol.146, no.2, p.395-410 (1983). Assuming a general nonderivative point interaction, and Born approximation, the angular distributions for neutrino scatterings by electrons are written, using only simple considerations, allowing all leptons to have nonzero mass. The distributions have been previously obtained for some special cases, from general considerations by Bell et al. (1975), or in the results of explicit calculations. Applications to the determination of the Lorentz structure of the neutral weak interaction, and to tests of lepton locality are considered. For illustration, two explicit calculations are given; one of these could hold for heavy lepton production, and the other for scattering of very low energy cosmic neutrinos. (10 refs.)

70307 Measurement of the ratios of neutral-current to charged cross sections of neutrino and antineutrino interactions in Ne. P.C.Bosetti, P.Fritze, H.Grassler, F.J.Hasert, R.Schulte, K.Schultze (III. Phys. Inst., Tech. Hochschule Aachen, Aachen, Germany), C.Geich-Gimbel, B.Nellen, R.Pech, B.Wunsch, A.Grant, P.O.Hulth, H.Klein, D.R.O.Morrison, L.Pape, H.Wachsmuth, A.Vayaki, K.W.J.Barnham, R.Beuselinck, E.F.Clayton, D.B.Miller, M.M.Mobayyen, A.Petrides, C.Albajar, G.Myatt, D.Saitta, J.Wells, T.Bolognese, D.Vignaud.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.1-10 (9 May 1983).
The ratios of neutral current to charged current cross sections of neutrino and antineutrino interactions in heavy Ne/H_2 mixture have been measured in

BEBC. The beam was the CERN SPS 200 GeV/*c* narrow band beam. The ratios were obtained using a cut in the transverse momentum of the hadronic system. In the standard Glashow-Salam-Weinberg model. The results correspond to the value of $\sin^2 \theta_w=0.182\pm0.020\pm0.012$. By combining this experiment with data from a hydrogen target the coupling constants $u_L{}^2$ and $d_L{}^2$ are found to be 0.15 ± 0.04 and 0.19 ± 0.05 respectively. (13 refs.)

70308 Decay of weak vector bosons in the broken colour gauge theory with integer charge quarks. S.Lakshmi Bala, G.Rajasekaran, S.D.Rindani.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.38
The processes W→gg and Z→gg are studied to order G_F in the cross-section in the integer-charge quark model. The contributions from these to the processes W→q$\bar{\text{q}}$ and Z→q$\bar{\text{q}}$ and the angular distribution of the two jets are obtained with both unpolarised and polarised initial beams.

12.35 COMPOSITE MODELS OF PARTICLES

70309 Massless composite particles and space-time description of gauge transformations. D.Han (Systems & Appl. Sci. Corp., Riverdale, MD, USA), Y.S.Kim, D.Son.
Phys. Rev. D (USA), vol.27, no.10, p.2348-53 (15 May 1983).
Space-time symmetries for massless composite particles are studied within the kinematical framework of the relativistic harmonic-oscillator formalism. It is noted first that the Lorentz-invariant harmonic-oscillator equation is separable in the Kalnins-Miller coordinate system in which the helicity and gauge transformation parameters can be separated from other space-time variables. It is shown that this separation procedure leads to the representations of the Poincare group which display the same space-time symmetry as those for photons and gravitons. The gauge transformation parameters are shown to be internal space-time parameters in the case of massless composite particles. It is shown in particular that the spin in this case is associated with an orbitlike motion on the plane perpendicular to the momentum of the composite particle. (23 refs.)

12.35C General properties of quantum chromodynamics (dynamics, confinement, etc.)

70310 Infra-red solutions of the Schwinger-Dyson equation for the discontinuity of the gluon propagator. F.Paccanoni (Istituto di Fisica, Univ. di Padova, Padova, Italy).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.3, p.267-76 (1 April 1983).
The possibility that solutions of the Schwinger-Dyson equation for the gluon propagator increase at large distances is investigated in the gauge technique. Without any assumption on the fourth-gluon vertex function, the author finds that solutions with this property do not exist, if the interacting gluon propagator has the same spin structure as that of the free one. The author sets up an integral equation for the discontinuity of the propagator, with its complete kinematical structure, and shows that a stronger infra-red singularity is possible in this case. (18 refs.)

70311 A flux tube model for hadrons. N.Isgur, J.Paton (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.247-51 (28 April 1983).
The authors have constructed a potential model for hadrons based on the strong coupling flux tube limit of QCD. The model, with quark and string-like degrees of freedom, offers a simple and unified framework in which not only ordinary mesons and baryons but also multiquark states, hermaphrodites, and pure glue states can be discussed. They comment on the relation of this model to the two-body $\mathbf{F}_i.\mathbf{F}_j$ potential model for pure quark states. They also present the expected quantum numbers and estimated masses of the low-lying hermaphrodite and pure glue states. (8 refs.)

70312 Glueball formation in chromostatics. K.A.Milton, W.Wilcox (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.252-6 (28 April 1983).
Confinement and bag formation is demonstrated for SU(2) static gluons in a semi-classical model in which the leading logarithm improvement to the classical lagrangian is employed. The gluons are represented by static sources in the adjoint representation and the fields are expanded in the algebra generated by the gluon charges. Restriction is made to the singlet representation by use of a suitable projection operator. The resulting action is equivalent to that of the quark-antiquark except for normalization of the current. This means the gluon and quark string tensions, respectively, are related by $\kappa_A/\kappa_F=1.63$. (16 refs.)

70313 A note on the magnetic mass squared in temporal gauge finite temperature QCD. S.P.Li, M.Baker (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.397-9 (5 May 1983).
Reexamines a recent calculation of the magnetic mass m_{mag} in the temporal gauge and shows that there is not necessarily a g^3T^2 term in $m_{\mathrm{mag}}{}^2$. (6 refs.)

70314 The next term in the thermodynamic potential of QCD. T.Toimela (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.407-9 (5 May 1983).
The thermodynamic potential of QCD is discussed. It is found that the plasmon effect contains besides the g^3-term a contribution of order $g^4\ln g$ at any non-zero temperature. This contribution is connected with the term proportional to $|k|T$ in $\Pi_{00}(k_0=0,\bar{k})$, which term is shown to be independent of the gauge-parameter in the general covariant gauge. (10 refs.)

70315 The SVZ method: why it works and why it fails. B.Durand, J.B.Whitenton (Phys. Dept., Univ. of Wisconsin-Madison, Madison, WI, USA), L.Durand.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.410-14 (5 May 1983).
The authors show in the context of potential theory, first, why the SVZ procedure (1979) for calculating hadronic masses succeeds phenomenologically: it provides a semiclassical interpolating formula which correctly relates input masses to output masses; and second, why it fails theoretically: the potential (or QCD) parameters derived from fits to masses are necessarily different from the true parameters. (16 refs.)

70316 On the colour-singlet quark-glue plasma. H.-Th.Elze, W.Greiner, J.Rafelski (Inst. fur Theoretische Phys., J.W. Goethe-Univ., Frankfurt am Main, Germany).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.515-19 (12 May 1983).
The assumed color-singlet character of physical states is treated exactly in a canonical partition function for the quark-glue plasma in a finite volume. It is shown that this non-peturbative effect leads to a gradual 'freezing' of internal degrees of freedom as compared to the Stephan-Boltzmann limit. (8 refs.)

70317 The limit $m_q \to 0$ of perturbative QCD. F.V.Tkachov (Inst. for Nuclear Res., Acad. of Sci., Moscow, USSR).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.85-8 (19 May 1983).
The effect of light quark masses, as seen from short distances, is discussed. The large logs of m_q/μ are shown to simulate 'vacuum condensates'. (13 refs.)

70318 Alternate factorization for the Drell-Yan process. G.Date (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. D (USA), vol.27, no.9, p.2076-100 (1 May 1983).
An alternate and more general form of factorization for the Drell-Yan process is derived in perturbation theory. Corresponding generalized anomalous dimensions are defined. Simple calculations verify Mueller's conjecture (1982) for the recovery of improved parton-model results at very high energies. The approach offers a general framework to analyze the role played by soft partons, and to study their influence on asymptotic behavior. (14 refs.)

70319 Mesons containing a heavy and a light quark in lattice quantum chromodynamics. H.W.Hamber (Inst. for Advanced Study, Princeton, NJ, USA).
Phys. Rev. D (USA), vol.27, no.9, p.2239-42 (1 May 1983).
The masses and decay constants of mesons composed of a heavy and a light quark are estimated in the SU(3) lattice gauge theory by a numerical simulation which excludes the effects of dynamic-fermion loops. In a mass region corresponding to the charmed *D* mesons the author finds some evidence for a different ordering of the *P*-wave states compared to the equal-quark-mass case. An accurate determination of the mass of these states could provide another test of QCD. (17 refs.)

70320 Towards an effective bilocal theory from quantum chromodynamics in a background field. J.A.Magpantay (Internat. Atomic Energy Agency, Trieste, Italy).
Phys. Rev. D (USA), vol.27, no.10, p.2423-32 (15 May 1983).
Using the path integral, the author shows how one can get background gauge-invariant bilocals (to be identified with mesons) from QCD in a nontrivial ground state. The author discusses in this paper mainly the formal manipulations, especially how to deal with the zero modes. (8 refs.)

70321 Suppression of color screening at large *N*. J.Greensite, M.B.Halpern (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2545-7 (15 May 1983).
In large-*N* QCD, deconfinement by color screening is suppressed. The adjoint string tension is twice the fundamental string tension. Consequences for models of confinements are discussed, and a simple model of a confining large-*N* master field is given. (10 refs.)

70322 Doubly-logarithmic asymptotic of the quark scattering amplitude with nonvacuum exchange in the *t*-channel. R.Kirschner, L.N.Lipatov (Leningrad Inst. of Nuclear Phys., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.2, p.266-73 (Aug. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.2, p.488-501 (Aug. 1982). [received: May 1983]
Nonlinear differential equations of the Riccati type for the *t*-channel partial waves $f_j(t)$ describing the scattering of quarks on the mass shell are derived by employing the dispersion relations. The derivation applies to high energies $s^{1/2}$ in the region $\alpha_s\ln^2(s/\mu^2)\sim1$, where μ is the infrared cutoff parameter with respect to the transverse momenta of the virtual particles. For colorless channels the solutions are found in explicit form. It is shown that the singularities of partial waves with negative signature are in all cases located to the right of the singularities of partial waves with positive signature, i.e. the negative signature dominates in the asymptotic region $\alpha_s\ln^2(s/\mu^2)\gg1$. (15 refs.)

70323 Quark counting of anomalous dimensions in higher orders of quantum chromodynamics. I.S.Avaliani, V.A.Matveev, L.A.Slepchenko (Joint Inst. for Nuclear Res., Dubna, USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.839-43 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.339-45 (Sept. 1982). [received: May 1983]
The influence of the higher approximations of quantum chromodynamics on the asymptotic behavior of the cross sections of inclusive processes with large momentum transfers is studied. It is shown that allowance for the two-loop corrections in the quark distribution and fragmentation functions in the region $|1-x_T|\ll1$ does not affect the universality of the quark counting of anomalous dimensions. (10 refs.)

70324 Exactly solvable model of a phase transition between hadronic and quark-gluon matter. M.I.Gorenshtein, G.M.Zinov'ev, V.K.Petrov, V.P.Shelest (Inst. of Theoretical Phys., Acad. of Sci., Ukrainian SSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.843-54 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.346-62 (Sept. 1982). [received: May 1983]
An exactly solvable model of a phase transition between hadronic and quark-gluon matter is proposed. In the model, the hadronic phase is a gas of bags constructed from point massless constituents. The mass spectrum and volume of these bags is found. Asymptotic expressions are obtained for the thermodynamic functions of the system in the neighborhood of the phase transition point. (11 refs.)

70325 Quark-confining potential and the form factors of pion and kaon. R.S.Kaushal (Dept. of Phys., Univ. of Delhi, Delhi, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.36
Pion and kaon form factors are calculated using the wave functions corresponding to a quark confining potential for the quark(q)-antiquark($\bar{\text{q}}$) system.

70326 Hadron structure in terms of eight-dimensional space-time manifestation. H.C.Chandola, B.S.Rajput (Dept. of Phys., Kumaun Univ., Naini Tal, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.51
In order to adequately discuss the problem of representation of ordinary and extended objects and the structure of hadrons, the authors have proposed a real eight-dimensional space-time formulation. The localization spaces and the internal symmetry spaces for the type of objects have been established. The analysis of the related properties of generalized Lorentz transformations in this scheme is related to the study of a homomorphic group, the elements of

which are associated with the mixing of symmetries of internal symmetry spaces for these objects.

12.35E Applications of quantum chromodynamics to particle properties and reactions

70327 Failure of a recently proposed $q\bar{q}$ potential to reproduce heavy quarkonium spectroscopy. M.Suwara (Inst. of Phys. & Nuclear Tech., Cracow, Poland).
Acta Phys. Pol B (Poland), vol.B14, no.4, p.281-5 (April 1983).
Flory (1981) has recently found support for the Shifman, Vainshtein and Zakharov (1979), estimate of *G* (the density of gluon condensate in vacuum) by deriving a q-$\bar{q}$ potential which uses *G* as an input and correctly predicts the string tension. Here the present author shows that Flory's potential gives wrong predictions for energy levels and leptonic widths of quarkonia. Consequently agreement found for the string tension is not conclusive. (7 refs.)

70328 Short-distance perturbation theory for the leading logarithm models. S.L.Adler (Inst. for Advanced Study, Princeton, NJ, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.381-94 (23 May 1983).
The author derives a short-distance perturbation expansion for the static potential of quasi-Abelian quark and antiquark source charges, in the models in which renormalization group radiative corrections are retained in the gauge gluon effective dielectric functional. A natural running coupling parameter ζ for the models is identified, and the scale mass Λ_p appearing in ζ is computed by requiring the vanishing of the $O(\zeta^2)$ term in the perturbation expansions. The models are shown to give unsatisfactory results beyond one-loop order in the short-distance expansion, as a result of the breakdown in the ultraviolet of the assumption that the effective action is a local functional of the field strength. The same argument indicates that the assumption of a local effective action becomes self-consistent in the large-distance limit. The coupling parameter ζ is identified as a running coupling which evolves in field strength, rather than momentum, and which becomes infinite in the large-distance limit. (7 refs.)

70329 Glueballs in the two-step potential model. D.S.Kulshreshtha (Dept. of Phys., Univ. Kaiserslautern, Kaiserslautern, Germany).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.18, p.619-24 (30 April 1983).
Glueball states are considered as the bound states of massive gluons (states of pure glue field) in a nonrelativistic, analytically solvable (for $l=0$), two-step potential model previously employed to study charmonium and bottonium systems and even the light mesons like π, ρ, K,... etc. The mass spectrum of excited states is predicted as $l=0$ radial excitations. Results are in fairly good agreement with the predictions of lattice gauge theories. The gluon mass turns out to be 853 MeV in close agreement with other predictions and the RMS value of glueball radius is found to be $(\langle r_G^2\rangle)^{1/2}=0.716$ fm. (26 refs.)

70330 Glueballs and a tensor dominance model. S.Minami (Dept. of Phys., Osaka City Univ., Osaka, Japan).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.1, p.1-4 (7 May 1983).
A tensor dominance model for the $q\bar{q}$ meson and the glueball G is suggested, and a possible $q^2\bar{q}^2$-G interaction is also discussed. (7 refs.)

70331 Properties of the meson system and chiral-symmetry-breaking parameters from quantum chromodynamics. S.Narison (LAPP Annecy-le-Vieux, France), N.Paver, D.Treleani.
Nuovo Cimento A (Italy), vol.74A, ser.2, no.3, p.347-63 (1 April 1983).
Some QCD-inspired spectral function sum rules are discussed, in view of the most recent experimental results on scalar and pseudoscalar mesons. Estimates are performed of the weak-decay amplitudes of O^- radial excitations, of the current quark mass ratio m_s/m_d and of the quark vacuum condensate ratio $\langle\bar{\psi}_s\psi_s\rangle/\langle\bar{\psi}_u\psi_u\rangle$. (22 refs.)

70332 QCD charmonium sum rules up to $O(G^4)$ order. S.N.Nikolaev, A.V.Radyushkin (Lab. of Theoretical Phys., JINR, Dubna, USSR).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.243-6 (28 April 1983).
The results are presented for the $O(G^4)$ power correction to QCD charmonium sum rules in the vector channel. It is shown that, under the standard assumptions concerning QCD vacuum structure, the inclusion of the $O(G^4)$ terms radically changes the theoretical curve for the ratio r_n, normally used to analyse the lowest charmonium states within the QCD sum rule approach. (15 refs.)

70333 A large mixing effect on η, η' and ι. E-i.Kawai (Dept. of Phys., Ehime Univ., Matsuyama, Japan).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.262-4 (28 April 1983).
The author quantitatively investigates a possible large mixing effect on $\eta(549)$, $\eta'(958)$ and $\iota(1440)$ in a phenomenological way, taking into account of both SU(3) symmetry breaking and gluon intervention. (6 refs.)

70334 $\psi\psi$ production by quarks, gluons and B mesons. B.Humpert, P.Mery (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.265-70 (28 April 1983).
The authors determine, in the framework of perturbative QCD, the $O(\alpha_s^2)$-$O(\alpha_s^4)$ parton cross sections for $\psi\psi$ production by quarks, gluons and B mesons. The hadronic production characteristics are compared with recent data from π^-N scattering. At present energies, $\psi\psi$ production via B meson decay is negligibly small. At collider energies, B production by ($\bar{q}$b) recombination constitutes, however, a considerable production mode. (15 refs.)

70335 Decay properties of massless bound gluinos. E.Franco (Istituto di Fisica Guglielmo Marconi, Rome, Italy).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.271-4 (28 April 1983).
Massless gluinos are confined into R-hadrons, together with gluons and quarks. The author estimates the lifetime of such R-hadrons on the basis of a model previously developed to describe ordinary hadrons. The energy spectrum of the emitted nuino is also derived. Using the known limitations on the parameters of broken supersymmetric models, the lower bound to the lifetime of R-hadrons is derived: $\tau>2.3\times10^{-14}$ (1 GeV/M)^5 s. (13 refs.)

70336 Glueballs multiquark states and the OZI rule. H.J.Lipkin (Dept. of Nuclear Phys., Weizmann Inst. of Sci., Rehovot, Israel).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.509-14 (12 May 1983).
New signatures for detection of non-quarkonium mesons are considered, including $K^+K^+\pi^+\pi^-$ and $K_sK_s\pi^+\pi^+$ decays for states where K^+K^+ and K^+K^{*+} decays are forbidden, and *A*-dependence of S* and δ production on nuclei by kaon beams. Analysis of OZI rule shows that only selection rules forbidding hairpin diagrams are valid and that $\phi\phi$ production by pion beams is not a serious OZI violation indicating presence of glueballs. (26 refs.)

70337 Second order QCD prediction for direct photon production in e^+e^- annihilation. I.Antoniadis, L.Baulieu, R.Lacaze (CENS, Gif-sur-Yvette, France).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.92-8 (19 May 1983).
The authors compute the deep inelastic structure function for the decay of a heavy time-like photon into a quasi real photon and hadrons. They show that the QCD corrections imply important modifications to the parton model prediction in the whole *x* range. It is also found that the next to leading QCD contribution is quite large as compared to the leading one. They finally investigate the relationship between this structure function and its space-like analogue. (17 refs.)

70338 Local charge compensation in the quark-cascade jet-production model. S.P.Misra, B.K.Parida (Inst. of Phys., Bhubaneswar, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.35
The charge correlations and the local charge compensation mechanism in rapidity space for quark jets are analysed in the framework of the quark-cascade jet-production model. The calculated results are compared with those observed experimentally in antineutrino-nucleon processes, and for the short range charge correlations observed in e^+e^- annihilation experiments.

70339 The K-factor in the Drell-Yan process and the test of asymptotic freedom. B.P.Mahapatra (Post-Graduate Dept. of Phys., Sambalpur Univ., Burla, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.44
The deep inelastic lepton scattering and massive lepton pair production data are simultaneously and excellently described without the need for the K-factor in the latter process in a simple quark parton model with only power suppressed correction to scaling. This raises grave doubt regarding the large higher order corrections through the K-factor predicted by asymptotic freedom for the Drell-Yan process.

12.35H Phenomenological composite models of particle structure and reactions (partons, bags, etc.)

70340 Possible absorptive corrections in hard-scattering processes at very high energies. N.G.Antoniou, N.D.Tracas (Dept. of Theoretical Phys., Univ. of Athens, Athens, Greece), S.D.P.Vlassopulos.
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.1, p.28-32 (7 May 1983).
Absorptive effects in hard-scattering processes, which can possibly originate from multiparton final-state interactions, give rise to a vanishingly small logarithmic correction to the parton→parton+parton splitting process, if simulated by Regge amplitudes. When this effect is iterated, within the leading logarithmic approximation of quantum chromodynamics, it may be promoted to a small power correction to the structure functions and be observable at very high energies. (7 refs.)

70341 Anticipated $t\bar{t}$ states in the quark-confining two-step potential model. D.S.Kulshreshtha (Internat. Centre for Theoretical Phys., Trieste, Italy).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.3, p.258-66 (1 April 1983).
The quark-confining, analytically solvable (for $l=0$), two-step potential model previously employed for charmonium and bottomium is now used to study the mass spectrum, thresholds and decay widths of the anticipated $t\bar{t}$ states as a function of quark mass. (11 refs.)

70342 Thermodynamics of extended hadrons with baryon number. S.A.Bonometto (Istituto di Fisica, Univ. di Padova, Padova, Italy).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.3, p.325-40 (1 April 1983).
A model for the hadron phase is discussed in conditions similar to the ones expected to hold, in a cosmological context, near the transition from quark matter into hadron matter. The conserved baryon number *B* is taken into account. Some evidence is found of a possible dependence of the transition temperature on *B*. Such a dependence could be quite relevant if a significant part of the present MW background is originated by population-III objects. This ought to be taken into account when results, obtained by means of Monte Carlo techniques on the lattice for the $B=0$ case, are extrapolated to the $B\neq0$ case. (18 refs.)

70343 Mass number dependence of large transverse momentum production and massive lepton pair production: effects of multi-quark clusters on high energy reactions off nuclear targets. S.Date (Dept. of Phys., Waseda Univ., Tokyo, Japan), A.Nakamura.
Prog. Theor. Phys. (Japan), vol.69, no.2, p.565-78 (Feb. 1983).
Assuming the existence of multi-quark clusters in nucleus the authors investigate large transverse momentum production in hadron-nucleus and alpha-alpha collisions and mass lepton pair production off nuclear targets in the framework of hard scattering model. The probability of finding multi-quark clusters in nucleus is parameterized in a simple form and the modified Kuti-Weisskopf model is employed to determine the parton distributions in the clusters. This approach yields results which are in reasonable accord with the data. It is shown that the existence of the multi-quark clusters in the nucleus is consistent with present data of muon pair experiments. (25 refs.)

70344 Hadron-quark phase transition and statistical quark bag model. S.Kagiyama (Dept. of Phys., Kagoshima Univ., Kagoshima, Japan), S.Hirooka, H.Kikukawa, J.Kikukawa.
Prog. Theor. Phys. (Japan), vol.69, no.2, p.579-88 (Feb. 1983).
The existence of the intermediate phase between hadron and quark phases, i.e., the multi-quark bag phase, is considered. The negative surface energy is introduced phenomenologically on the basis of the statistical quark bag model in order to ensure that the smallest bag is most stable. However, with the increase of the quark number density in the bag, the surface energy becomes unimportant in comparison with the kinetic energy of the quark, and it is well known that the mass of the bag is proportional to 3/4 power of the quark number in the naive bag model. Thus the multi-quark bag becomes stable at high quark density. The above property suggests a possibility of the hadron-multiquark bag phase transition. (36 refs.)

70345 Top-quark mass and bottom-quark decay. P.H.Ginsparg, S.L.Glashow (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA), M.B.Wise.
Phys. Rev. Lett. (USA), vol.50, no.19, p.1415-18 (9 May 1983).
The possibility of a long *B*-meson lifetime is explored, in which case the weak mixing angles θ_2 and θ_3 are quite small. This allows the derivation of a lower bound on the top quark mass as a function of the *B*-meson lifetime, by comparison of the short-distance prediction for the *CP*-nonconservation parameter ϵ with its experimental value. The bound is significant for $\tau_B>4\times10^{-13}$s. (12 refs.)

70346 Effective potential for $\bar{q}q$-condensation. K.Higashijima (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.257-8 (28 April 1983).
A method to evaluate the short distance contribution to an effective potential for $\bar{q}q$-condensation is proposed. Chiral symmetry is shown to break down spontaneously by studying the effective potential in the two-loop approximation. (7 refs.)

70347 Nucleon resonances and the quark model. H.Hogaasen (Dept. of Phys., Univ. of Oslo, Oslo, Norway), J.M.Richard.
Phys. Lett. B (Netherlands), vol.124B, no.6, p.520-2 (12 May 1983).
The authors study the level ordering of the nucleon resonances in the nonrelativistic quark model. With any plausible phenomenological potential, the orbital excitation with negative parity always turns out to have the lowest mass contrary to the experimental situation where the Roper resonance with positive parity comes first. (13 refs.)

70348 On the axial charge and other static properties of the quark core in nucleons. R.Tegen, M.Schedl, W.Weise (Inst. of Theoretical Phys., Univ. of Regensburg, Regensburg, Germany).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.9-13 (19 May 1983).
The authors present calculations of the axial vector constant g_A in models where relativistic quarks are confined by scalar potentials, with special emphasis on center-of-mass corrections and pion cloud effects. It is demonstrated that pionic contributions to g_A from a$f_\pi\partial_\mu\phi$ term in the axial current vanish for finite pion mass. Confining potentials of the form cr^n with $n=2$, 3 give acceptable values for g_A together with quark core radii between 0.5 and 0.6 fm. They also calculate the pion-nucleon coupling constant and establish a connection between g_A and the quark core part of the magnetic moment, including center-of-mass corrections. About half of the proton magnetic moment is shown to come from the quark core. (18 refs.)

70349 Charmed-quark fragmentation into charmed hadrons. L.M.Jones (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), R.Migneron.
Phys. Rev. D (USA), vol.27, no.9, p.2063-7 (1 May 1983).
The authors show that in a model where fragmentation functions are created from jet calculus followed by recombination, the fragmentation function of charmed quarks into *D* mesons will fail to peak at low *x* at currently accessible values of Q^2. Likewise, the fragmentation of a *c* quark into a Λ_c is much less peaked toward small *x* then the production of protons by *u* quarks. The model predicts a magnitude for the fragmentation function much smaller than is experimentally observed. (16 refs.)

70350 ψ and Υ systems in a consistent quark model. C.S.Kalman, N.Mukerji (Elementary Particle Phys. Group, Concordia Univ., Montreal, Quebec, Canada).
Phys. Rev. D (USA), vol.27, no.9, p.2114-18 (1 May 1983).
The η_b, η'_b, *P*, and *D* states of the Υ system as well as the missing $^1P_1$, $^3D_2$, and $^3D_3$ states of the ψ system are calculated based on a parameter system obtained from the known masses of states of the charmonium system. The results are consistent with flavor independence of the potential; however, the compositions of the states are found to differ in the ψ and Υ systems. (11 refs.)

70351 Updated analysis of the quark-mixing matrix and its phenomenological implications. L.-L.Chau, W.-Y.Keung, M.D.Tran (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. D (USA), vol.27, no.9, p.2145-66 (1 May 1983).
The 3×3 quark-mixing matrix of Kobayashi and Maskawa (1973) is reexamined, using the latest information in calculating the K_L-K_S mass difference and the *CP*-violation parameter ϵ, and using recent data of ν and $\bar{\nu}$ production of opposite-sign dileptons, and semileptonic decays of charmed and *b*-flavored particles; then the neutral-particle-antiparticle mixing and *CP* violation in the $D^0\bar{D}^0$, $B^0\bar{B}^0$, and $T^0\bar{T}^0$ systems are calculated. Constraints on the mixing matrix and *t*-quark mass from $K_L\rightarrow\mu^+\mu^-$ are also considered. (48 refs.)

70352 Gluon-gluon interactions in the bag model. C.E.Carlson (Coll. of William & Mary, Williamsburg, VA, USA), T.H.Hansson, C.Peterson.
Phys. Rev. D (USA), vol.27, no.9, p.2167-81 (1 May 1983).
An effective spin-dependent interaction Hamiltonian for low-lying gluon modes is calculated to $O(\alpha_s)$ in the MIT bag model. The authors give expressions for the energy shifts of low-lying glueballs. (20 refs.)

70353 Bag-inspired gluonic and relativistic effects in a harmonic-oscillator model. A.Sharma, M.Gupta (Dept. of Phys., Panjab Univ., Chandigarh, India).
Phys. Rev. D (USA), vol.27, no.9, p.2182-90 (1 May 1983).
The harmonic-oscillator (HO) quark model, wherein Pauli spinors are replaced by Dirac spinors and quark masses are less than $^1/_3$ of the nucleon mass, is studied in the spirit of the bag model. In particular, the authors have calculated G_A/G_V and the magnetic moment and charge radius of the proton; the variation of these quantities with quark mass and spring constant is also investigated. In the case of the magnetic moment they find that the relativistic correction is of the right order of magnitude, while in the case of charge radius the result is better than the nonrelativistic HO value. For G_A/G_V they find that the relativistic corrections bring the nonrelativistic value of 1.667 down to ~1.50 only; reasons for this less-than-anticipated fall are investigated in detail. Furthermore, the authors have calculated certain gluon probability integrals; the trend of the results is the same as those of Golowich (1978) and of Close and Horgan (1980). (27 refs.)

70354 Recoil corrections in bag models. J.-L.Dethier, R.Goldflam, E.M.Henley, L.Wilets (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
Phys. Rev. D (USA), vol.27, no.9, p.2191-8 (1 May 1983).
The recoil corrections to bag models are considered using a definition of the center-of-energy operator analogous to the Newtonian concept of center of mass. This definition is used to calculate corrections to bag energy, charge radius, and other properties within the framework of the soliton bag model. Some of the results also apply directly to the MIT bag model and compare favorably with other analyses. (13 refs.)

70355 Vector and scalar confining potentials and the Klein paradox. P.M.Fishbane (Phys. Dept., Univ. of Virginia, Charlottesville, VA, USA), S.G.Gasiorowicz, D.C.Johannsen, P.Kaus.
Phys. Rev. D (USA), vol.27, no.10, p.2433-8 (15 May 1983).
Confining potentials in equations involving the interaction of fermions lead to no Klein paradoxes if the strength of the vector potential is appropriately limited compared to the scalar potential. For linear potentials the Regge trajectories are asymptotically like those of the harmonic oscillator, namely, $E^2\sim j$. (7 refs.)

70356 Confinement in a Bethe-Salpeter model with logarithmic potential. S.N.Biswas, S.R.Choudhury, K.Datta, A.Goyal (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India).
Phys. Rev. D (USA), vol.27, no.10, p.2439-44 (15 May 1983).
The authors show that the covariant Bethe-Salpeter equation for two scalar quarks confined through a kernel of the form $K\sim[(p-p')^2]^{-3/2}$ possesses a discrete spectrum: this kernel is a simple covariant generalization of the potential in configuration space proportional to $\ln r$. To investigate the spectrum, they adopt a new approximation scheme to convert the covariant Bethe-Salpeter equation into a three-dimensional one, the consistency of the scheme being checked by applying it to the Wick-Cutkosky equation (1954) for the covariant Coulomb problem and obtaining a Balmer-type formula. The spectrum as revealed by investigating the *S*-wave part of the resulting three-dimensional equation by semiclassical methods is essentially of the type obtained from the Schrodinger equation with a $\ln r$ potential; relativistic effects depress the energy levels. (12 refs.)

70357 Topological theory of hadrons. I. Mesons. H.P.Stapp (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2445-77 (15 May 1983).
Spin is incorporated into the hadronic topological expansion scheme. Spin analogs of Chan-Paton factors (1969) are introduced in a way that avoids the troubles encountered in earlier attempts. Those troubles, at the meson level, were, first, the occurrence of twice the wanted number of pseudoscalar and vector mesons; second, the occurrence of parity-doublet partners of the pseudoscalar and vector mesons; and third, the occurrence of these parity-doublet partners as particles of negative metric, called ghosts. These troubles are all avoided by introducing a new topological level, called zero entropy, that lies below the ordered level. At the zero-entropy level quarks of opposite chirality are treated as distinct particles. The theory has been extended to all hadrons, and the basic particles are exactly those of the constituent-quark model, which for baryons start with the (56^+) and (70^-). The theory is formulated in the *M*-function framework, where the 'quarks' are represented by two-component spinors, and it entails $SU(6)_w$ symmetry of the hadronic vertices at a low level of the topological expansion. (31 refs.)

70358 Topological theory of hadrons. II. Baryons. H.P.Stapp (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Phys. Rev. D (USA), vol.27, no.10, p.2478-82 (15 May 1983).
For pt.I see ibid., vol.27, p.2445 (1983). The first paper of this series described a method for incorporating spin into the meson sector of the topological theory of hadrons. This second paper extends the theory to all hadrons. It also incorporates into the covariant *S*-matrix topological framework the group-theoretic properties of the constituent-quark model. 12.40 MODELS OF STRONG INTERACTIONS

70361 Model hadron asymptotic behaviour. P.A.Kralchevski, A.V.Nikolov (Faculty of Phys., Univ. of Sofia, Sofia, Bulgaria).
Bulg. J. Phys. (Bulgaria), vol.10, no.1, p.3-13 (1983).
The authors consider a set of asymptotic equations that describe the model hadron interaction. An iterative procedure consisting of two stages is proposed and the first stage is exhaustively studied. The principle of contracting transformations has been applied for this purpose. Under rather general and natural assumptions, solutions in a series of metric spaces suitable for physical applications have been found. For each of these spaces a solution with unique definiteness is found. (9 refs.)

70362 Solution of Chew-Low equations in the quadratic approximation. V.P.Gerdt, A.Yu.Zharkov (Joint Inst. for Nuclear Res., Dubna, USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.868-74 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.384-92 (Sept. 1982). [received: May 1983]
The second-order power contributions are found in the framework of the iterative scheme of construction of the general Chew-Low equation (1956) proposed by Gerdt (1980). In contrast to the linear approximation obtained by Gerdt, the quadratic approximation has an infinite number of poles in the complex plane of the uniformizing variable w. It is shown that allowance for the quadratic corrections in the general solution makes it possible to distinguish the class of solutions possessing the required Born pole at the point w=0. The most cumbersome part of the analytic computations in the present study was done on a computer using the algebraic system REDUCE-2. (13 refs.)

12.40E Statistical models

70363 Strong coupling expansion of the Liouville model. G.A.Aldazabal, E.Dagotto, R.Deza (Inst. Balseiro, Mendoza, Argentina), N.Parga.
Phys. Lett. B (Netherlands), vol.125B, no.1, p.81-4 (19 May 1983).
Using a strong coupling expansion the authors show that in two dimensions the Liouville model has a continuous energy spectrum and that the mean value of the field is infinite. They also apply the technique to the one-dimensional system and to a simple quantum mechanical problem where those properties are known to be true. (12 refs.)

12.40H Duality and dual models

70364 Fermionic strings with boundary terms. II. The O(2) string. P.Di Vecchia (Phys. Dept., Univ. of Wuppertal, Wuppertal, Germany), B.Durhuus, P.Olesen, J.L.Petersen.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.395-412 (23 May 1983).
The authors compute the boundary terms for the O(2) string by use of Polyakov's approach to the quantization problem. The effective action is conformally U(1) invariant, but breaks chiral invariance. (8 refs.)

(inc. interactions involving cosmic rays)

70367 Radiative corrections to neutrino-lepton scattering in the $SU(2)_L \otimes U(1)$ theory. S.Sarantakos, A.Sirlin (Dept. of Phys., New York Univ., New York, NY, USA), W.J.Marciano.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.84-116 (9 May 1983).
The radiative corrections of $O(\alpha)$ to the final electron spectrum and the total cross sections for the processes $\nu_\mu+e\rightarrow\nu_\mu+e$, $\bar{\nu}_\mu+e\rightarrow\bar{\nu}_\mu+e$, $\nu_e+e\rightarrow\nu_e+e$, and $\bar{\nu}_e+e\rightarrow\bar{\nu}_e+e$ are studied in the framework of the $SU(2)_L \otimes U(1)$ theory. The electroweak corrections to the first two processes are presented in two equivalent schemes in terms of $(G_\mu, \sin^2\theta_W)$ and $(G_\mu, \sin^2\theta_W(m_W))$. As a byproduct, the relationship to $O(\alpha)$ between the basic parameters $\sin^2\theta_W\equiv1-m_W{}^2/m_Z{}^2$ and $\sin^2\theta_W(m_W)$ (defined by modified minimal subtrac-

tion) is explicitly given. The QED corrections are evaluated in the extreme relativistic (ER) regime of the final electron ($E_e'\gg m_e$) for the situation in which the bremsstrahlung photons are unobserved and unrestricted. The ER approximation allows one to obtain simple analytic expressions for the differential electron spectrum and the total cross sections. The relationship to $O(G_F\alpha)$ between the spin-averaged differential cross sections for the above processes in the ER regime is derived. (24 refs.)

70368 Fragmentation functions in high energy ν and $\bar{\nu}$ deuterium interactions. D.Allasia (Istituto di Fisica, Univ. di Torino, Turin, Italy), C.Angelini, S.Barlag, L.Bertanza, F.Bianchi, A.Bigi, V.Bisi, F.Bobisut, T.Bolognese, E.Calimani, R.Casali, P.Capiluppi, S.Ciampolillo, J.Derkaoui, M.L.Faccini-Turluer, R.Fantechi, V.Flaminio, A.G.Frodesen, D.Gamba, G.Giacomelli, B.Grung, A.Halsteinslid, A.Hornaes, H.Huzita, B.Jongejans, M.Loreti, C.Louedec, G.Mandrioli, A.Marzari-Chiesa, P.Mazzanti, L.Mosca, K.Myklebost, A.Nappi, R.Pazzi, G.M.Pierazzini, L.Riccati, A.Romero, A.M.Rossi, A.Sconza, P.Serra-Lugaresi, G.W.van Apeldoorn, P.van Dam, D.Vignaud, C.Visser, R.Wigmans.
Phys. Lett. B (Netherlands), vol.124B, no.6, p.543-9 (12 May 1983).
Quark fragmentation functions are studied in charged current ν and $\bar{\nu}$ interactions in deuterium. The W^2, Q^2 and y dependences are compared with the predictions of first order QCD and with those of higher twists. The W^2 dependence is a small effect in the authors' kinematical range and their data are well linked to the higher W^2 muon scattering experiment. The Q^2 dependence of nonsinglet fragmentation functions is well reproduced by first order QCD but part of this dependence could be due to some low W kinematical effect. The y-z factorization breaking seems to be a low W effect but a small higher twist term, as predicted by Berger (1980) cannot be excluded. (17 refs.)

13.20 LEPTONIC AND SEMILEPTONIC DECAYS OF MESONS

70369 Constraints on light particles from kaon decays. J.Ellis, J.S.Hagelin (CERN, Geneva, Switzerland).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.189-214 (9 May 1983).
The authors show that the decay $K^+\to\pi^+$+unobserved neutrals (?) can give useful information about light neutral particles, including the number of neutrino types. Observation of the decay $K^+\to\pi^+ + ?$ would give a lower bound on the number of neutrinos, which would be strengthened by improvement of the present lower bound on the top quark mass m_t. Nonobservation of the decay $K^+\to\pi^+ + ?$ gives an upper bound on the number of neutrinos whose associated leptons have masses outside a window whose width shrinks as m_t increases. Perturbative strong interactions are included in the calculations. They also estimate the rates for $K^+\to\pi^+$+light neutral supersymmetric particles such as photinos, gravitinos and shiggses. They find that decays into photinos and gravitinos are suppressed relative to conventional neutrinos whereas decays into shiggses may be comparable with one conventional neutrino flavour. They stress the desirability of a new round of $K^+\to\pi^+ + ?$ decay experiments. (43 refs.)

70370 Structure functions of flavoured heavy hadrons in weak semi-leptonic decay. S.Iwao (Dept. of Phys., Coll. of Liberal Arts, Kanazawa Univ., Kanazawa, Japan).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.18, p.603-8 (30 April 1983).
To study the properties of the flavoured heavy hadrons, the structure functions for them are introduced in their weak semi-leptonic decays. The scaling hypothesis and the associated properties are investigated through the beauty meson decay. (17 refs.)

70371 Search for massive neutrinos in the decay $\pi\to e\nu$. D.A.Bryman, R.Dubois, T.Numao, B.Olaniyi, A.Olin (TRIUMF, Vancouver, Canada), M.S.Dixit, J.-M.Poutissou, J.A.Macdonald.
Phys. Rev. Lett. (USA), vol.50, no.20, p.1546-9 (16 May 1983).
The positron spectrum from the decay $\pi^+\to e^+\nu_e$ has been examined for evidence of peaks arising from an admixture in the ν_e weak eigenstate of massive neutrinos. Limits on the intensity of such peaks, together with the measured $\pi\to e\nu$ branching ratio, have been used to derive constraints on the neutrino mixing parameters over the range $4\ \text{MeV}<m(\nu)<135\ \text{MeV}$. (16 refs.)

70372 Analysis of radiative pion decay $\pi^-\to e^-\nu\gamma$. Jing-Ning Huang, Ching-Yieh Lee (Dept. of Phys., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Phys. Rev. D (USA), vol.27, no.9, p.2227-30 (1 May 1983).
The authors give a quantitative account of radiative pion decays. By the chiral structure of the interaction and the fact of the low mass ratio between an electron and a pion, one can suppress the inner-bremsstrahlung contribution and correspondingly enhance the structure-dependent contribution by looking at decays with the emission of a negative-helicity electron. By this observation, they examine a way of determining the value of the structure-dependent parameter γ, giving particular attention to the decay spectra with this electron helicity. They also investigate the effects of a neutrino mass in this process. (11 refs.)

13.25 HADRONIC DECAYS OF MESONS

70373 Test for a heavy, long-lived neutral boson from $K_{\pi 2}$ decay in neutrino beams. S.Barshay (III. Phys. Inst., Tech. Hochschule Aachen, Aachen, Germany).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.259-61 (28 April 1983).
A boson A^0 which couples to a flavor change and emanates from $K^+\to\pi^+A^0$ at a branching level of $\lesssim 10^{-7}$ could decay only via $A^0\to e^{\mp}\mu^{\pm}$ with a lifetime of a few milliseconds. This would give rise to anomalous $(e\mu)$ events at a level which should be detectable in present low-energy neutrino beams. (13 refs.)

70374 On the D^0-D^+ lifetime problem: evaluation of interference and W-exchange effects. H.Sawayanagi, K.Fujii, T.Okazaki, S.Okubo (Dept. of Phys., Hokkaido Univ., Sapporo, Japan).
Phys. Rev. D (USA), vol.27, no.9, p.2107-13 (1 May 1983).
The authors investigate the Cabibbo-allowed nonleptonic decays of the D mesons by using the relativistic quark model combined with the free-quark picture for the final state. Two main ideas which have been proposed to explain the lifetime difference between D^+ and D^0, i.e. the interference model and the W-exchange-dominance model, are considered. One can treat the noninterference and the interference terms on the same footing, and find that the interference effect is not the main origin of the lifetime difference because of the color and spin mismatch. It also seems to be difficult to enhance the W-exchange diagram even if one can vitiate the color and helicity suppression. (16 refs.)

70375 Branching-ratio predictions for the $\iota(1440)$. W.F.Palmer, S.S.Pinsky (Dept. of Phys., Ohio State Univ., Columbus, OH, USA).
Phys. Rev. D (USA), vol.27, no.9, p.2219-22 (1 May 1983).
A simple pole model is used to predict $\iota\to\delta\pi$, $\rho\gamma$, $\omega\gamma$, $\phi\gamma$, $\rho\pi\pi$, and $\eta\pi\pi$. The rates $\iota\to\eta\pi\pi$ and $\iota\to KK\pi$ are examined in detail. In the pole model the rate $\iota\to\eta\pi\pi$ is compared to $\eta'\to\eta\pi\pi$ and one has the prediction $B(\iota\to\eta\pi\pi)/B(\iota\to KK\pi)=10\%$. A direct calculation that takes into account the cancellation between $\iota\to\delta\pi\to(\eta\pi)\pi$ and $\iota\to\eta\epsilon\to\eta(\pi\pi)$, the $K\bar{K}$ threshold, and SU(3) violations seen in the decay of the δ, predicts $20\%\le B(\iota\to\eta\pi\pi)/B(\iota\to KK\pi)\le 110\%$. Both calculations are consistent with the experimental limit of 50%. (16 refs.)

70376 Quark-quark interaction and $K\to 2\pi$ decays. C.P.Singh (Dept. of Phys., VSSD Coll., Kanpur India), P.K.Chatley.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.37
The authors investigate $K\to 2\pi$ decays using some effective phenomenological one-gluon exchange interaction potentials in which the relativistic corrections are small and the spin dependent force is essentially of long range.

13.30 DECAYS OF BARYONS

70377 Right-handed current effects in $\Delta S=1$ semileptonic decays. T.Oka (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Phys. Rev. Lett. (USA), vol.50, no.19, p.1423-6 (9 May 1983).
Some problems encountered in describing the $\Delta S=1$ semileptonic hyperon decays in terms of the Cabibbo model are considered, and these decays are studied in the $SU(2)_L \otimes SU(2)_R \otimes U(1)$ gauge theory. It is found that a reported discrepancy between the Cabibbo model and experiment in $\Lambda\to pe\bar{\nu}_e$ can be accounted for if right-handed currents exist. The only obstacle to this interpretation is the experimental sign of the electron asymmetry in $\Sigma\to ne\bar{\nu}_e$ which, as in the Cabibbo model, is predicted to be negative. (29 refs.)

70378 Observable gravitationally induced baryon decay. J.Ellis, J.S.Hagelin (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA), D.V.Nanopoulos, K.Tamvakis.
Phys. Lett. B (Netherlands), vol.124B, no.6, p.484-90 (12 May 1983).
The authors find that in supersymmetric theories gravitodynamic effects scaled by the inverse of the Planck mass can induce baryon decay at an observable rate. In a minimal supersymmetric (susy) grand unified theory (GUT) the dominant gravitationally induced baryon decay mode is $B\to\bar{\nu}+K$, with a likely admixture of $p\to(e^+ \text{ or } \mu^+)+K$. As a by-product, they present an improved estimate of Higgs-mediated baryon decay branching ratios in minimal susy GUTs. They consider the possibility that a loss of quantum coherence may be observable in gravitationally induced baryon decay, but argue that this would be difficult to reconcile with successful experimental test of quantum mechanics. (23 refs.)

70379 Proton decay inside the nucleus. M.V.N.Murthy, K.V.L.Sarma (Tata Inst. of Fundamental Res., Bombay, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.29
The authors study the effects of nuclear environment on the baryon-number-violating decays inside a nucleus. In decays of the type $p\to\pi^0e^+$ that calculate the effects due to Fermi motion of the decaying nucleon on the distributions of the final positron momentum (k) and of the 'back-to-back' angle (θ) between π^0 and e^+. Absorptive decays such as $pp\to pe^+$ with virtual π^0 and ω^0 exchanges have been studied incorporating the two-nucleon correlations in the initial state. Calculations are specialized to two-body decays but do not depend on any specific GUT model.

70380 On $n\to\bar{p}+e^++\nu_e$. V.Gupta, V.Singh (Tata Inst. of Fundamental Res., Bombay, India), S.Pakvasa.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.33
Estimates for the rate of $\Delta B=2$ decay mode $n\to\bar{p}e^+\nu_e$ are discussed. It is suggested that experimental setups to study proton decay and n-$\bar{n}$ oscillations can provide limits on this mode.

13.35 DECAYS OF LEPTONS

70381 Constraint on Lorentz non-invariance from the Michel parameter. R.Huerta-Quintanilla (Fermi Nat. Accelerator Lab., Batavia, IL, USA), J.L.Lucio M.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.369-70 (5 May 1983).
It is pointed out that the Michel parameter can be used to put a limit on a class of Lorentz non-invariant interactions. (6 refs.)

70382 Measuring gluon condensation. J.Chakrabarti (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.400-2 (5 May 1983).
Argues that the decay of the τ-lepton provides a reasonable basis for the determination of the masses of the light quarks. It also has a direct bearing on the estimates of gluon condensation. (7 refs.)

70383 A new experimental limit on electron stability. E.Bellotti, M.Corti, E.Fiorini, C.Liguori, A.Pullia, A.Sarracino, P.Sverzellati, L.Zanotti (Dipartimento di Fisica, Univ. di Milano, Milan, Italy).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.435-8 (5 May 1983).
Preliminary results are reported of an experiment on electron stability carried out with a Ge(Li) detector in the Mont Blanc laboratory at a depth of about 5000 mwe. No evidence was found either for the disappearance of K electrons in germanium atoms, or for the decay of electrons into a photon and a neutrino. Lower limits of 2×10^{22} and 3×10^{23} yr have been set for the corresponding half lifetimes. (11 refs.)

70384 On the mixings of heavy neutrinos and muon decays. M.S.Dixit (Nat. Res. Council of Canada, Ottawa, Ontario, Canada), P.Kalyniak, J.N.Ng.
Phys. Rev. D (USA), vol.27, no.9, p.2216-18 (1 May 1983).
The authors set limits on the mixing of heavy neutrinos into the muon family, $|U_{\mu i}|^2$, for neutrino masses in the range 30 to 70 MeV/c^2. Both the Michel parameter and the e^+ spectrum are used. This complements limits from leptonic decays of pseudoscalar mesons. They also give indications of how current experiments can be used to improve these limits. (12 refs.)

70385 Negative-norm states, superselection rules, and the lepton family. J.P.Crawford (Dept. of Phys., Univ. of Colorado, Denver, CO, USA), A.O.Barut.
Phys. Rev. D (USA), vol.27, no.10, p.2493-9 (15 May 1983).
Field theories containing states of both positive and negative norm are considered. With the correct definition of the number operators for the quantum fields, all physical quantities are rendered canonically normalized. If the theory admits a global symmetry leading to a superselection rule which forbids transitions between positive and negative-norm states, then the negative-norm states are allowed to be physical. Specifically, a spinor theory with higher-order field equations and multiple excitations is considered and applied to the charged lepton system: e, μ, τ. In this model, the negative norm of the muon state allows us to understand the nonexistence of $\mu\to e\gamma$ decay. For minimal coupling, the theory is renormalizable and equivalent to three separate fermion electrodynamics with the additional prediction of equal charge for the leptons. A further anomalous magnetic moment coupling can only allow one of the decays $\tau\to\mu\gamma$ or $\tau\to e\gamma$. (12 refs.)

13.40 ELECTROMAGNETIC PROCESSES AND PROPERTIES

13.40D Electromagnetic mass differences

70386 New formula for proton-neutron mass difference. I.Kimel (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Phys. Rev. D (USA), vol.27, no.9, p.2129-38 (1 May 1983).
A new formula is presented allowing the computation of the proton-neutron mass difference without the knowledge of the subtraction function in the dispersion integral. The Born terms contribute with the correct sign. The integral over the deep-inelastic region is finite whenever the Weinberg-'t Hooft mechanism is operative, and gives a small value. The net result is in very good agreement with the experimental value. (20 refs.)

Updated analysis of the quark-mixing matrix and its phenomenological implications .... See Entry 70351

13.40F Electromagnetic form factors; electric and magnetic moments

70387 Magnetic moments of light baryons in harmonic model. S.B.Khadkikar, S.K.Gupta (Internat. Centre for Theoretical Phys., Trieste, Italy).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.523-6 (12 May 1983).
Anomalous magnetic moments of light baryons are calculated in a relativistic harmonic oscillator model to obtain good agreement with experiment. (17 refs.)

70388 Linear symmetric quark theories of baryon magnetic moments. Y.Dothan (School of Phys. & Astron., Univ. of Minnesota, Minneapolis, MN, USA).
Phys. Rev. D (USA), vol.27, no.9, p.2139-44 (1 May 1983).
A phenomenological and theoretical analysis of the baryon magnetic mmoments leads to a definition of the class of linear symmetric quark theories for the baryon moments. In this class of theories there are members that can reproduce the experimental results fairly well. However, it seems that despite SU(3) breaking the average of the light-quark magnetic moments $^1/_3(\mu_u+\mu_d+\mu_s)$ is unexpectedly small. A possible explanation is an anomalous moment for the quarks. (10 refs.)

13.40H Electromagnetic decays

70389 Two-photon decay of 2^+ mesons and $SU(3)_f$ symmetry breaking. P.Singer (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.531-4 (12 May 1983).
The consequences of a model for the transitions of tensor mesons to two photons are examined. The f^0, A_2^0, $f'\to 2_\gamma$ decays are expressed in terms of experimentally measured one-photon transitions of vector mesons to pseudoscalar mesons and remarkable agreement with experiment is demonstrated. The model requires the SU(3)-flavor symmetry breaking observed in vector meson radiative transitions to determine the pattern of symmetry breaking in radiative decays of tensor mesons. (19 refs.)

70390 Radiative decays of light- and heavy-flavor tensor mesons. P.Singer (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel).
Phys. Rev. D (USA), vol.27, no.9, p.2223-6 (1 May 1983).
New data are used to reexamine $T\to V\gamma$ and $T\to\gamma\gamma$ decays. Their strength is determined from sum rules involving experimentally determined quantities. One of two models considered is in excellent agreement with the measured f^0, $A_2^0\to\gamma\gamma$ transitions. The model is extended to calculate radiative decays of strange and charmed tensor mesons. (23 refs.)

13.60 PHOTON AND CHARGED-LEPTON INTERACTIONS WITH HADRONS

(for neutrino interactions, see 13.15)

70392 Leptoproduction of supersymmetric particles. S.K.Jones, C.H.Llewellyn Smith (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.145-71 (9 May 1983).
The authors study the production of scalar leptons $(\tilde{l})$, scalar quarks $(\tilde{q})$ and gluinos $(\tilde{g})$ in $ep\to\tilde{\nu}X$, and $ep\to\tilde{e}X$ and the associated production of $\tilde{q}$ and $\tilde{g}$ in $ep\to eX$ and $ep\to\nu X$. They find that $\tilde{\nu}\tilde{q}$ and $\tilde{e}\tilde{q}$ production is probably measurable at HERA for masses of order 40 GeV with exchanged particle masses of order 80 GeV. They derive and solve the asymptotic supersymmetric evolution equations for quark, gluon, scalar quark and gluino distributions. They find sum rules for the asymptotic momentum fractions and for the partition of the net quark number between quarks and scalar quarks. They use a fusion model to study associated leptoproduction in the threshold region. The only appreciable contribution is from small Q^2 electroproduction but the rates are low even for scalar quarks and gluinos with masses close to the present limits. (21 refs.)

13.60H Total and inclusive cross sections

(inc. deep-inelastic processes)

70393 Q^2-, and x_B- and W^2-dependence of hadron multiplicities and the Pati-Salam model. E.M.Santangelo (Dept. de Fisica, Univ. Nacional de La Plata, La Plata, Argentina).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.2, p.55-60 (14 May 1983).
The author considers the unexpected behaviour of hadron multiplicities in μp scattering found by the EMC collaboration (1982). A mechanism based on the Pati-Salam GUT (1976) is proposed to account for these experimental results. (9 refs.)

70394 Electron scattering from nuclear targets and quark distributions in nuclei. A.Bodek, N.Giokaris (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA), W.B.Atwood, D.H.Coward, D.J.Sherden, D.L.Dubin, J.E.Elias, J.I.Friedman, H.W.Kendall, J.S.Poucher, E.M.Riordan.
Phys. Rev. Lett. (USA), vol.50, no.19, p.1431-4 (9 May 1983).
The deep-inelastic electromagnetic structure functions of steel, deuterium, and hydrogen nuclei have been measured with use of the high-energy electron beam at the Stanford Linear Accelerator Center. The ratio of the structure functions of steel and deuterium cannot be understood simply by corrections due to Fermi-motion effects. The data indicate that the quark momentum distributions in the nucleon become distorted in the nucleus. The present results are consistent with recent measurements with high-energy muon beams. (21 refs.)

13.60P Baryon and baryon resonance production

70395 P-odd effects in the deuteron electrodisintegration $e+d\to e^-+n+p$. M.P.Rekalo, G.I.Gakh, A.P.Rekalo.
Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.481-7 (April 1983). In Russian.
The general structure of *P*-odd polarization characteristics caused by the *P*-invariance violation in nuclear forces has been established for the deuteron electrodisintegration, $e^-+d\to e^-+n+p$. It is shown that *P*-odd effects may

arise in the $e^- + d \to e^- + n + p$ reaction when measuring the differential cross-section with the detection of the two particles in the final state, all particles in the initial and final states being unpolarized. The *P*-odd asymmetries arising in the collision of the polarized electrons with polarized deuterons have been considered. The *P*-odd contributions to the polarization of the recoil protons have also been calculated. (24 refs.)

70396 Polarization characteristics of the Δ-isobar in the $\gamma + p \to \pi^- + \Delta^{++}$ reaction. A.A.Zayats, I.L.Semisalov.
Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.487-92 (April 1983). In Russian.
The angular dependence of Δ-isobar polarization characteristics in the $\gamma + p \to \pi^- + \Delta^{++}$ reaction has been studied in terms of the model considering contributions of the $N^*(1470)$, $N^*(1519)$, $N^*(1652)$, $N^*(1672)$ nucleon resonances and a single-pion gradient-invariant mechanism with allowance for the absorption of lower partial waves. The calculation has been performed in the rest system of the Δ-isobar for γ-quantum energies of 0.7 and 1 GeV. Unpolarized initial particles and a polarized proton target are discussed. (14 refs.)

13.65 HADRON PRODUCTION BY ELECTRON-POSITRON COLLISIONS

70397 Radiative corrections to Z_0 jet asymmetries in e^+e^- annihilation. M.Consoli (Istituto di Fisica, Univ. di Catania, Catania, Italy), M.Greco.
Nuovo Cimento A (Italy), vol.74A, ser.2, no.3, p.237-44 (1 April 1983).
Electromagnetic and finite-width effects are discussed for $q\bar{q}$ jets produced in e^+e^- annihilation near the Z_0 pole. Angular asymmetries are also considered for inclusively produced π^+ and K^+ with large fractional momenta. (8 refs.)

70398 Can soft gluon effects be measured in electron-positron annihilation. J.Kodaira, L.Trentadue (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.693-7 (Feb. 1983).
The energy-energy correlations at large angles in e^+e^- annihilation is calculated by resumming soft gluon contributions through two-loop level. The result is compared with experimental data. No agreement is obtaining using a purely perturbative analysis. The relevance of nonperturbative effects at present energies is emphasized. (14 refs.)

70399 Inclusive electron production in e^+e^- annihilation at 29 GeV. M.E.Nelson, A.Blondel, G.H.Trilling, G.S.Abrams, D.Amidei, C.A.Blocker, A.M.Boyarski, M.Breidenbach, D.L.Burke, W.Chinowsky, W.E.Dieterle, J.B.Dillon, J.M.Dorfan, M.W.Eaton, G.J.Feldman, M.E.B.Franklin, G.Gidal, L.Gladney, M.S.Gold, G.Goldhaber, L.J.Golding, G.Hanson, R.J.Hollebeek, W.R.Innes, J.A.Jaros, A.D.Johnson, J.A.Kadyk, A.J.Lankford, R.R.Larsen, B.LeClaire, M.Levi, N.Lockyer, V.Luth, C.Matteuzzi, J.F.Patrick, M.L.Perl, B.Richter, P.C.Rowson, T.Schaad, H.M.Schellman, D.Schlatter, R.F.Schwitters, P.D.Sheldon, J.Strait, C.de la Vaissiere, J.M.Yelton, C.Zaiser (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Phys. Rev. Lett. (USA), vol.50, no.20, p.1542-5 (16 May 1983).
The total momentum and transverse momentum spectra of electrons in e^+e^- annihilation at 29 GeV have been measured. The inclusive cross section is determined to be $14.4 \pm 1.6 \pm 5.2$ pb for momenta greater than 2 GeV/*c*. The average semielectronic branching ratios of charm and bottom quarks are measured to be $(6.3 \pm 1.2 \pm 2.1)\%$ and $(11.6 \pm 2.1 \pm 1.7)\%$, respectively. The fragmentation function for bottom quarks is determined to be peaked at high *z*, with $\langle z \rangle_b = 0.75 \pm 0.05 \pm 0.04$. (16 refs.)

70400 Supersymmetry in two-photon processes. E.Reya (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.424-8 (5 May 1983).
The effects of supersymmetry are studied in two-photon processes in particular for the photon structure function F_2^γ. Supersymmetry not only significantly influences the *x* dependence of F_2^γ but the direct production of scalar quarks also has pronounced effects in $F_2^\gamma(x,Q^2)$. In the threshold region such effects should be observable at LEP provided squark masses are not larger than of order $m_{W\pm}/2$; the absence of these effects puts lower limits on squark (slepton) masses. (14 refs.)

70401 Effect of weak interactions on e^+e^- annihilation into two jets in the integer charge quark model. S.Lakshmi Bala, G.Rajasekaran, S.D.Rindani.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.39
The process $e^+e^- \to 2$ jets is studied in the broken colour gauge theory with integer-charge quarks. The change in the angular distribution due to the neutral weak boson propagator and the weak-boson gluon coupling is obtained. The ratio R and the charge asymmetry have been calculated.

70402 e^+e^- annihilation into three jets in the integer-charge quark model. S.Lakshmi Bala, G.Rajasekaran, S.D.Rindani.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.40
The process $e^+e^- \to 3$ jets has been studied in the ICQ model with weak boson effects taken into account. The ratio of the cross-section for production of the three gluon jet to that of the $q\bar{q}g$ jets, as well as the thrust distribution, charge asymmetry and angular distribution of these jets have been calculated.

70403 Bounds on long-range hadronic interactions. L.Bracci, G.Fiorentini (INFN, Pisa, Italy), R.Tripiccione.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.215-47 (9 May 1983).
Bounds on long-range nucleon-nucleon interactions are obtained from the analysis of gravitational experiments, molecular spectroscopy and low and intermediate energy nuclear phenomena. Previously existing results are improved, and rather general types of potentials are considered: potentials behaving as $1/R^n$ and potentials corresponding to the exchange of scalar and pseudoscalar particles. (34 refs.)

70404 Spin effects in low energy proton-antiproton forward elastic scattering. M.Lacombe, B.Loiseau, B.Moussallam, Vinh Mau (Div. de Phys. Theorique, Inst. de Phys. Nucleaire, Orsay, France).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.443-5 (12 May 1983).
Predictions of the $\bar{p}p$ forward elastic cross section and of the real to imaginary ratio ρ given by the $N\bar{N}$ interaction the authors proposed recently are reported. Their cross sections compare very well with recent measurements at $400 < p_L < 730$ MeV/*c* and 700 MeV/*c*. It is also shown that spin effects cannot be neglected in the determination of ρ as usually assumed. (7 refs.)

70405 Differences between $\bar{p}p$ and pp interactions at 8.8 GeV/*c* and their relationship to $\bar{p}p$ annihilations. C.N.Booth, R.E.Ansorge, J.R.Carter, W.W.Neal, J.G.Rushbrooke, A.J.Simmons, D.R.Ward, T.O.White (Cavendish Lab., Univ. of Cambridge, Cambridge, England), R.A.Lewis, B.Y.Oh, M.Pratap, G.A.Smith, J.Whitmore.
Phys. Rev. D (USA), vol.27, no.9, p.2018-40 (1 May 1983).
The authors report on an experiment in which the SLAC 40-in. hybrid facility was exposed to an 8.8-GeV/*c* antiproton beam. Using external detectors they have identified a large fraction of nonannihilation events and thus obtained a clean sample of annihilation data. Using proton interactions taken in the same detector at the same energy they have made a detailed study of ($\bar{p}p$-pp) differences and explored their relationship to $\bar{p}p$ annihilations. (38 refs.)

70406 Description of elastic diffractional pp-scattering by overlapping functions. G.G.Arushanov, E.I.Ismatov, V.G.Arushanov, M.G.Sattarov, A.Yulchiev, M.S.Yakubov.
Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.498-505 (April 1983). In Russian.
Experimental data on proton-proton elastic scattering at FNAL and ISR energies in a wide range of transmitted pulses up to $-t = 15(\mathrm{GeV}/c)^2$ are described by inelastic overlapping functions taking into account absorbing effects. Both dependences of these functions are the transmitted pulse and pointing parameter and dependences of effective trajectories on *t* and *s* have been obtained. (16 refs.)

70407 Damping state method and kaonic bound states. M.Atarashi (Dept. of Phys., Hiroshima Univ., Hiroshima, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.589-601 (Feb. 1983).
A damping state method in the radiation field is generalized in the case of a multi-channel system with strong interactions. This approach is applied to the analysis of the K^--p system, where experimental complex level shifts of the 1*s* state are considerably different from the previous predictions. For the elementary interaction the author uses the nonlocal potential of a separable type, which reproduces not only measured values of the K^--N cross section but also effective properties of the resonance $Y_0^*(1405)$ and K^--N scattering length. The author's results for the complex level shift of the 1*s* state are consistent with the present experimental results. (18 refs.)

13.85D Elastic scattering (energy > 10 GeV)

70408 Soft π^-p and pp elastic scattering in the energy range 30 to 345 GeV. J.P.Burq, M.Chemarin, M.Chevallier (Inst. de Phys. Nucleaire, Univ. de Lyon-Villeurbanne, France), A.S.Denisov, C.Dore, T.Ekelof, J.Fay, P.Grafstrom, L.Gustafsson, E.Hagberg, B.Ille, A.P.Kashchuk, G.A.Korolev, A.V.Kulikov, S.Kullander, M.Lambert, J.P.Martin, S.Maury, M.Querrou, V.A.Schegelsky, E.M.Spiridenkov, I.I.Tkach, M.Verbeken, A.A.Vorobyov.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.2, p.285-35 (23 May 1983).
Differential cross sections for π^-p and pp elastic scattering have been measured at incident momenta ranging from 30 to 345 GeV and in the *t* range $0.002\ (\mathrm{GeV}/c)^2 \leq |t| \leq 0.04\ (\mathrm{GeV}/c)^2$. From the analysis of the data, the ratio $\rho\ (t=0)$ of the real to the imaginary parts of the forward scattering amplitude was determined together with the logarithmic slope *b* of the diffraction cone. The results on the real parts confirm the validity of the forward dispersion relations at high energies. Using the dispersion relations, it was shown that the experimental data on $\rho_{\pi^-p}(t=0)$ require a continuous rise of the total πp cross sections, at least up to the energy of 2000 GeV, thus revealing a close similarity in high-energy behaviour of πp and pp interactions. The results on the slope parameters show consistency with the hypothesis of a universal shrinkage of the hadronic diffraction cone at high energies.

The value of the asymptotic shrinkage parameter α_p' was found to be independent of the kind of the incident hadron and of the momentum transfer. (55 refs.)

70409 Pion-proton backward elastic scattering between 30 and 90 GeV/*c*. W.F.Baker, D.P.Eartly, J.S.Klinger, A.J.Lennox, R.Rubinstein (Fermi Nat. Accelerator Lab., Batavia, IL, USA), R.M.Kalbach, A.E.Pifer, P.A.Polakos.
Phys. Rev. D (USA), vol.27, no.9, p.1999-2017 (1 May 1983).
Backward elastic scattering of $\pi^{\pm}$ on protons has been measured for incident pion momenta between 30 and 90 GeV/*c* and $0 \leq -u \leq 0.5$ (GeV/*c*)^2. The *u* dependence of the cross sections is similar to that observed at lower momenta, and Regge models give acceptable fits to the data. (35 refs.)

70410 Possible existence of further dip structures in πp and Kp elastic collisions. C.H.Lai, S.Y.Lo, K.K.Phua (Dept. of Phys., Nat. Univ. of Singapore, Kent Ridge, Singapore).
Phys. Rev. D (USA), vol.27, no.9, p.2214-15 (1 May 1983).
Dip structures in the differential cross sections of πp and Kp elastic collisions are investigated using the Chou-Yang model. Variation of the dip positions with total cross section is also presented. (5 refs.)

13.85F Inelastic scattering, two-particle final states (energy > 10 GeV)

70411 Analysis of $\pi^- p \to \pi^0 n$ scattering at high energies. Fazal-e-Aleem, M.Saleem (Dept. of Phys., Punjab Univ., Lahore, Pakistan).
Phys. Rev. D (USA), vol.27, no.9, p.2068-75 (1 May 1983).
The differential cross sections for $\pi^- p \to \pi^0 n$ including the recent measurements up to $-t \approx 2.2$ (GeV/*c*)^2, the polarization, and the difference $\Delta\sigma = \sigma_{tot}(\pi^+ p) - \sigma_{tot}(\pi^- p)$ are fitted in the region of high energy by using a ρ+cut model. The $I_t = 1$ amplitudes deduced from the model for $\pi^- p \to \pi^0 n$ are found to be in good agreement with those obtained by amplitude-analysis results of $\pi N \to \pi N$ at 6 GeV/*c*. (37 refs.)

A quark model calculation of the weak parity violating asymmetry in high-energy proton-nucleon scattering ....See Entry 70246

Spin effects in hadronic collisions at large momentum transfers ....See Entry 70412

13.85K Inclusive reactions, including total cross sections, (energy > 10 GeV)

70412 Spin effects in hadronic collisions at large momentum transfers. J.Szwed (Inst. of Computer Sci., Jagellonian Univ., Cracow, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.4, p.239-80 (April 1983).
The role of spin in hadron-hadron collisions at large p_T is investigated. The short distance diagrams and the end-point ($x \to 1$) contribution give phenomenologically similar results for the elastic nucleon-nucleon differential cross-section but differ significantly when looking at the spin-spin asymmetries. The spin analysis suggests the dominance of the end-point diagrams at large angles and present energies. The limits on the nucleon wave function are obtained from the comparison of spin effects in exclusive and inclusive reactions. Higher order results in exclusive channels are reviewed. In the inclusive production the author proposes a simple model of baryon polarization at large transverse momentum which accounts qualitatively for all experimental data in these processes. Other models are also reviewed. The whole investigation suggests that the spin effects are a relatively clear probe of the complicated hadron dynamics. (66 refs.)

70413 Inclusive production of the charmed baryon Λ_c^+ in nCH-interactions near 55 GeV. D.T.Burilkov, V.I.Genchev, I.M.Geshkov, P.K.Markov (Inst. of Nuclear Res. & Nuclear Energetics, Bulgarian Acad. of Sci., Sofia, Bulgaria), A.N.Aleev, V.A.Arefiev, B.P.Balandin, V.K.Birulev, V.D.Cholakov, A.S.Chvyrov, T.S.Grigalashvili, B.N.Gus'kov, I.M.Ivanchenko, I.N.Kakurin, N.N.Karpenko, D.A.Kirillov, I.G.Kosarev, V.R.Krastev, B.A.Kulakov, N.A.Kuz'min, M.F.Likhachev, A.L.Lyubimov, A.B.Maksimov, A.N.Morozov, Ngueng Mong Zao, A.E.Senner, L.V.Sil'vestrov, V.E.Simonov, L.A.Slepets, M.Smizanska, G.G.Sultanov, G.G.Takhtamyshev, P.T.Todorov, R.K.Trayanov, K.-H.Hiller, H.Nowak, A.V.Pose, H.-E.Ryseck, A.S.Belousov, A.M.Fomenko, E.I.Malynovsky, S.V.Rusakov, Yu.V.Soloviev, P.N.Shareiko, L.N.Shtarkov, Ya.A.Vazdyk, E.A.Chudakov, J.Hladky, S.Nemecek, M.Novak, A.Prokes, V.J.Zayachky, V.P.Dzhordzhadse, V.D.Kekelidze, N.L.Lomidze, G.I.Nikobadze, R.G.Shanidze, K.D.Marinov, M.V.Tosheva.
Bulg. J. Phys. (Bulgaria), vol.10, no.1, p.49-57 (1983).
The charmed baryon Λ_c^+ inclusive production and its decay mode $\Lambda_c^+ \to \bar{K}^0 p\pi^+ n^-$ have been observed in neutron-CH-interactions near 55 GeV. The experiment is performed using the BIS-2 spectrometer located in the neutron beam of the Serpukhov accelerator. The mass of the Λ_c^+ is measured to be 2282 ± 9 MeV/c^2. The cross-section for Λ_c^+ production in nCH-interactions times the branching ratio in the observed channel is estimated to be (31 ± 5) μb with systematical error ~50%. The new data confirm the previous results (Aleev et al., 1981) for Λ_c^+ production in nC-interactions near 58 GeV.

70414 The production of high-momentum particles and resonances in pp collisions at the CERN Intersecting Storage Rings. G.J.Bobbink, M.A.Van Driel, F.C.Erne, W.G.J.Langeveld, J.C.Sens (Nat. Inst. for Nuclear & High-Energy Phys., Amsterdam, Netherlands), D.Favart, P.Leleux, M.M.Block, R.Campanini, H.W.Ludwig, M.A.Botje, R.J.Goossens, P.Hoppenbrouwers, B.Van Uitert.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.11-30 (9 May 1983).
Data are reported on the momentum distributions of Λ, $\Lambda(1520)$, $\phi(1020)$, $\bar{\Lambda}$ and $\bar{p}$, inclusively produced between 1° and 2° with respect to one of the primary proton beams at the CERN Intersecting Storage Rings. In addition, the decay angular distribution of the $\Lambda(1520)$, the ratio of the cross sections for the production of $\Sigma^-(1385)$ and $\Sigma^+(1385)$ and the ratios among different charge states of the pairs $\Lambda\pi$, ΛK, $\Delta^{++}(1232)\pi$ and $\pi\pi$ have been measured. These data are confronted with current ideas on fragmentation. (29 refs.)

70415 pp production cross-sections and the constraint method. J.C.Anjos, A.F.S.Santoro, M.H.G.Souza (Centro Brasileiro de Pesquisas Fisicas, CBPF/CNPq, Rio de Janeiro, RJ, Brazil), E.Pedrazzi.
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.15, p.491-4 (9 April 1983).
A method of constructing production cross-sections that satisfy the constraints represented by the first few moments is shown to give an excellent account of the data when applied to the high-energy pp production cross-sections $\sigma_n(s)$ plotted as functions of *n*. (8 refs.)

70416 Single-jet events at the proton-antiproton collider—a possible interpretation via top flavor. R.M.Godbole (Dept. of Phys., Univ. of Bombay, Bombay, India), S.Pakvasa, D.P.Roy.
Phys. Rev. Lett. (USA), vol.50, no.20, p.1539-41 (16 May 1983).
Pair production of a very heavy flavor like top leads to large-p_T isolated electrons back to back with jets as observed by Arnison et al. (1983). With a top-quark mass ~35 GeV, one can account for all the experimental features of these single-jet events available so far. Further tests for this interpretation are suggested. (7 refs.)

70417 Are there new effects in the ISR and collider $\bar{p}p$ and pp data?. P.Gauron, B.Nicolescu (Div. de Phys. Theorique, Inst. de Phys. Nucleaire, Orsay, France).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.429-34 (5 May 1983).
The new ISR and collider $\bar{p}p$ and pp data are confronted with the possible presence of a $l=1$ singularity in the odd-under-crossing amplitude (the 'odderon'). The authors point out the compatibility of the data with the presence of a minimum in the difference between $\bar{p}p$ and pp total cross sections located at $\sqrt{s} \simeq 80$ GeV. The crucial necessity of having non-contradictory ISR data is emphasized. (28 refs.)

70418 Upper limits on beauty meson production in π^-collisions at 280 GeV/*c*. J.Badier (Ecole Polytech., Palaiseau, France), J.Bourcrot, J.Bourotte, G.Burgun, O.Callot, Ph.Charpentier, M.Crozon, D.Decamp, P.Delpierre, B.Gandois, R.Hagelberg, M.Hansroul, Y.Karyotakis, W.Kienzle, P.le Du, J.Lefrancois, Th.Leray, J.Maillard, A.Michelini, Ph.Mine, G.Rahal, O.Runolfsson, P.Siegrist, A.Tilquin, J.Valentin, R.Vanderhaghen, S.Weisz.
Phys. Lett. B (Netherlands), vol.124B, no.6, p.535-42 (12 May 1983).
From events with two like-sign muons, or with three or four muons, observed in the NA3 spectrometer with 280 GeV/*c* incoming π^- beam, the authors deduce upper limits on the production of beauty meson pairs $B\bar{B}$. They use the leptonic branching ratios of B meson measured at CESR storage rings, and assume that no nulcear effects occur in the platinum target. They find $\sigma(B\bar{B}) < 2$ nb/nucleon for centrally produced $B\bar{B}$ pairs, and $\sigma(B\bar{B}) < 10$ nb/nucleon for a diffractive production. These values are one order of magnitude lower than previously published limits. As a consequence, the $\psi\psi$ events observed in their experiment cannot come from $B\bar{B}$ decays. (19 refs.)

70419 Anomalous electron-pair production in 17-GeV/c $\pi^- p$ collisions. M.R.Adams, G.Abshire, C.Brown, E.S.Crandall, J.Goldberger, P.D.Grannis, B.T.Meadows, J.Stekas (State Univ. of New York, Stony Brook, NY, USA), G.J.Donaldson, H.A.Gordon, G.R.Morris, P.Rehak, L.Cormell.
Phys. Rev. D (USA), vol.27, no.9, p.1977-98 (1 May 1983).
The authors have measured inclusive e^+e^- production in 17-GeV/*c* $\pi^- p$ collisions and find anomalously large cross sections for pair masses below 0.6 GeV/c^2 and Feynman $x < 0.5$. Charged particles and photons produced in association with e^+e^- were measured. Decays of known resonances are not capable of explaining the effect. No excess of photons or charged particles associated with the anomalous pairs is detected. Implications of the results for various models and for direct single-electron and photon production are discussed. (41 refs.)

70420 Higgs-boson production in p-$\bar{p}$ collisions at collider energies. S.F.Novaes (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Phys. Rev. D (USA), vol.27, no.9, p.2211-13 (1 May 1983).
The author shows that the contribution of gluon fusion to Higgs-boson production in proton-antiproton collisions is much smaller than what has been predicted before for large Higgs-boson masses. (8 refs.)

70421 Triggering on high-transverse-momentum jets. H.E.Miettinen (Phys. Dept., Rice Univ., Houston, TX, USA).
Phys. Rev. D (USA), vol.27, no.9, p.2236-8 (1 May 1983).
The author compares the characteristics of events selected by 'global' and 'two-high' triggers in large-transverse-energy hadron-hadron collisions. Using a QCD-based Monte Carlo model of Fox and collaborators (1982) the author finds that the former is effectively a high-multiplicity trigger, the latter a high-planarity trigger favoring unusually clean jet events. Predictions of the model for both triggers are in good qualitative agreement with recent data. (7 refs.)

70422 Direct photon pair production in hadron collisions as a test of integer-charge quark model. T.Jayaraman, G.Rajasekaran, S.D.Rindani (Dept. of Theoretical Phys., Univ. of Madras, Madras, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.41
The authors have studied the process $pp(p\bar{p}) \to \gamma\gamma X$ as a test of the integer-charged quarks in a gauge theory of broken colour. They have calculated the cross section arising due to both the quark and gluon contributions. They have examined the sensitivity of the cross section to the variation of the quark and gluon distribution functions.

13.90 OTHER TOPICS IN SPECIFIC REACTIONS AND PHENOMENOLOGY OF ELEMENTARY PARTICLES

70424 A calculation of $Z^0 \rightarrow 2$ gluinos. G.L.Kane (Randall Lab. of Phys., Univ. of Michigan, Ann Arbor, MI, USA), W.B.Rolnick.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B217, no.1, p.117-24 (9 May 1983).
The authors report the results of a one-loop calculation of $Z^0 \rightarrow \tilde{g}\tilde{g}$, where $\tilde{g}$ is a gluino, the proposed supersymmetric partner of a gluon. Depending on the masses of the scalar quarks and of the top quark, the branching ratio for the decay is in the 10^{-5} to 10^{-4} range for gluino mass below about 40 GeV. The signature for gluinos should allow detection in this range. (6 refs.)

14.80 OTHER AND HYPOTHETICAL PARTICLES

70425 Binding of magnetic monopoles and atomic nuclei. L.Bracci, G.Fiorentini (Istituto di Fisica, Univ. di Pisa, Pisa, Italy).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.493-6 (12 May 1983).
The authors discuss the possibility that magnetic monopoles bind to atomic nuclei. They estimate the binding energy of these systems to be in the range 10-100 keV and the formation cross section to be $\sigma_{\rm for} \gtrsim 10^{-28}$ cm^2. They find that most likely monopoles reaching Earth are bound to a proton and present bounds on the monopole flux. (10 refs.)

21.00 NUCLEAR STRUCTURE

21.10 GENERAL AND AVERAGE PROPERTIES OF NUCLEI; PROPERTIES OF NUCLEAR ENERGY LEVELS

(for properties of specific nuclei listed by mass ranges, see 27.)

70426 Investigation of the decay of oriented ^{145}Eu nuclei. V.A.Deryuga (Kharkov State Univ., Kharkov, Ukrainian SSR), T.I.Kratsikova, M.Finger, Ya.Dupak, A.N.Vdovin, W.D.Hamilton.
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.23-30 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.860-6 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
Studies the decay of ^{145}Eu nuclei oriented at ultralow temperatures for the first time. The multipolarity-mixing parameters have been determined for a large number of transitions, and the spins of a series of levels of ^{145}Sm have been established uniquely or refined. Certain properties of the low-lying states of ^{145}Sm have been analysed within the framework of the quasi-particle-phonon semimicroscopic model of the nucleus. (22 refs.)

70427 Investigation of the decay of oriented ^{147}Eu nuclei. V.A.Deryuga (Kharkov State Univ., Kharkov, Ukrainian SSR), T.I.Kratsikova, M.Finger, V.M.Tsupko-Sitnikov, Yu.V.Yushkevich.
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.31-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.867-73 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
The authors studied the decay of ^{147}Eu nuclei oriented at ultralow temperatures in iron and gadolinium matrices for the purpose of obtaining new information on the multipolarity-mixing parameters of the transitions and the spins of the levels of ^{147}Sm. (30 refs.)

70428 Structure of the excited states of the odd isotopes of bromine ^{75,77,79,81,83}Br. V.E.Mitroshin, B.A.Nemashkalo, V.K.Chirt (B.P. Konstantinov Leningrad Inst. of Nuclear Phys., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.41-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.877-84 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
The odd isotopes of bromine $^{75-83}$Br are studied within the framework of a model that takes account of the coupling between the odd quasi-particle and the anharmonic vibrations of the spherical core. The fundamental features of the approach given, which distinguish it from existing approaches, reside in the following: (a) consideration of the Pauli principle for interaction between an odd quasi-particle and collective modes, and between quasi-particles forming collective degrees of freedom; (b) consideration of the influence of zero vibrations of the shape of the nucleus on the effective forces, the one-particle M1-, E1-, E2-moments and the spectroscopic factors; (c) the use of a unified representation for the wave function which is acceptable for the description of spherical, transitional and deformed nuclei. These differences allow the authors to hope for success in the description of both the 'rotational' and the 'vibrational' features of the dynamics of the bromine isotopes. (22 refs.)

70429 Excitation of the collective states of nuclei of the transitional region having A≈190 to 200 for inelastic scattering of low-energy neutrons. V.I.Popov, I.V.Surkova (Inst. of Nuclear Res., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.54-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.892-6 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
Presents the results of investigating the excitation of the 2_1^+ levels and, in certain cases, other collective levels of ^{188,190,192}Os, ^{194,196,198}Pt, ^{198,200,202,204}Hg and ^{206}Pb during inelastic scattering of neutrons near the reaction threshold. (12 refs.)

70430 Octupole states in the SO(6) limit. Di Yao-min (Jiangsu Normal Coll., China).
Chin. Phys. (USA), vol.3, no.1, p.118-28 (Jan.-March 1983). [received: May 1983]
The authors treat the octupole states in even-even nuclei using a system consisting of f^- boson and $N-1$ s^+, d^+ bosons. The SO(6) limiting case is emphasized and the analytic relations for energies and electromagnetic transition rates are derived. Finally the two-particle states are briefly discussed. (6 refs.)

70431 Identification of single-particle configurations at very high spin in $^{150-152}$Dy. D.Horn, O.Hausser, I.S.Towner, H.R.Andrews, M.A.Lone (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
Phys. Rev. Lett. (USA), vol.50, no.19, p.1447-50 (9 May 1983).
Gamma-gamma coincidence studies of $^{150-152}$ Dy have been performed with use of Compton-suppressed Ge(Li) detectors to resolve ambiguities in the high-spin structure of these nuclei. On the basis of I^π assignments, transition rates, and level systematics for $^{148-152}$Dy, the observed levels are interpreted as proton particle-hole excitations coupled to aligned valence neutron configurations. The proposed single-particle configurations are confirmed by shell-model calculations. (16 refs.)

70432 Yrast-Yrare interaction in Os nuclei. A.Neskakis, R.M.Lieder (Inst. fur Kernphys., KFA Julich, Julich, Germany), G.Sletten, G.D.Dracoulis.
Phys. Rev. Lett. (USA), vol.50, no.20, p.1628-30 (16 May 1983).
Dracoulis, Fahlander, and Fewell (1980) have reported about yrast and yrare bands in light Os nuclei. The authors also studied ^{180}Os, using the reaction ^{182}W(α,6n) and the reaction ^{166}Er(^{18}O,4n). The partial level scheme of ^{180}Os disagrees with that given by Dracoulis, Fahlander, and Fewell. The discrepancy can be described as an interchange of the yrast and yrare bands. The states have the same energies, but some of the spin assignments are different, since Dracoulis, Fahlander, and Fewell consider the 527.5- and 699.1-keV γ rays as stretched $E2$ transitions whereas they identified them as unstretched $M1$ transitions. Furthermore they observed several new transitions which have not been seen by Dracoulis, Fahlander, and Fewell. The arguments for their assignments are presented. The following in the response by Dracoulis: the transitions, at 1051, 1094, and 1241 keV, were not observed in the author's coincidence data. Lines of those energies are evident in the author's singles measurements, but have not been assigned to ^{180}Os. (7 refs.)

70433 U(6/12) supersymmetries in nuclei. Sun Hong Zhou (Inst. de Fisica, Univ. Nacional Autonoma Mexico, Mexico City, Mexico), A.Frank, P.van Isacker.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.275-80 (5 May 1983).
The authors analyze three subgroup chains of U(6/12) appropriate for regions where uncoupled fermions can occupy $j=1/2$, 3/2 and 5/2 single particle orbits and present a possible manifestation of U(5) supersymmetry in the Hg isotopes. (14 refs.)

70434 Centroids and widths in the symplectic collective model. J.P.Draayer (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA), G.Rosensteel.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.281-3 (5 May 1983).
Methods of statistical spectroscopy are applied to the symplectic collective shell model. Analytic expressions are given for determining the distribution of U(3) centroids within an irreducible representation of Sp(3,$\mathbf{R}$) for the Bohr-Mottelson collective $V(\beta, \gamma)$ potential. For ^{20}Ne, a comparison is made between statistical predictions and shell-model results for the U(3) content of states in the ground state domain. The results suggest that statistical measures can be used reliably to truncate symplectic model spaces so that microscopic calculations become feasible. (9 refs.)

70435 The interacting boson model in the germanium region. P.D.Duval (C.E. Bruyeres-le-Chatel, Montrouge, France), D.Goutte, M.Vergnes.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.297-301 (5 May 1983).
The Interacting Boson Model plus Configuration Mixing is tested in the germanium region. Results for ^{68}Ge$_{36}$ to ^{76}Ge$_{44}$ are given which show good overall agreement with energy levels, B(E2) values, quadrupole moments and, for the first time, two-neutron transfer cross sections. (21 refs.)

70436 Evidence for 3p-2h rotational bands in ^{17}O. A.Cunsolo, A.Foti, G.Imme, G.Pappalardo, G.Raciti (Istituto Nazionale di Fisica Nucleare, Catania, Italy), N.Saunier.
Phys. Lett. B (Netherlands), vol.124B, no.6, p.439-42 (12 May 1983).
Comparison is made, in the weak coupling hypothesis, between the transitions to positive parity ^{17}O states selectively excited in the ^{14}C(^{6}Li, t)^{17}O reaction at E(^{6}Li)=34 MeV, and those from the ^{16}O(^{6}Li, t)^{19}Ne reaction at E (^{6}Li)=36 MeV, leading to the $K^\pi=1/2^+$ rotational band states in ^{19}Ne. The good results show the validity of the weak coupling hypothesis, and indicate the existence of two 3p-2h bands in the ^{17}O nucleus. The candidates for $L=0$, 2, 4 members of the $T=1/2$ rotational band and for $L=4$ member of the $T=3/2$ band are suggested. These findings are confirmed by the extracted ^{3}He-spectroscopic strengths. (11 refs.)

70437 Vibrations of the atomic nucleus. G.F.Bertsch.
Sci. Am. (USA), vol.248, no.5, p.40-51 (May 1983).
The nucleus can quiver, ring or even 'breathe'; the coordinated motion of the nuclear particles reveals much about the forces between them. Six modes of vibration have been detected so far. (no refs.)

70438 Study of spin-orbit interaction of ^{13}C and ^{15}N nuclei in ^{14}C induced transfer reactions on ^{138}Ba. W.von Oertzen, E.R.Flynn (Hahn-Meitner-Inst. fur Kernforschung, Berlin, Germany), J.C.Peng, J.W.Sunier, R.E.Brown.
Z. Phys. A (Germany), vol.310, no.4, p.275-85 (1983).
Angular distributions of single nucleon transfer reactions populating single particle states in the reactions ^{138}Ba(^{14}C, ^{15}N)^{137}Cs and ^{138}Ba(^{14}C, ^{13}C)^{139}Ba have been studied. The shapes of the angular distributions show differences for different final configurations. Using the reaction asymmetry it is possible to describe these differences consistently for all transitions by a spin-orbit potential. The polarisation of the outgoing fragments is discussed and its dependence on final configurations is explained. The spin-orbit potentials deduced from the reaction asymmetry are large, as compared to predictions of folding potentials. They are, however, consistent with measurements of spin-

flip probabilities. The origin of the *L-S* interaction is to be found in coupling effects of second order in the heavy ion reaction. (27 refs.)

70439 Non local effects induced by the particle-vibration coupling. O.Civitarese (Dept. de Fisica, Univ. Nacional de la Plata, La Plata, Argentina), R.P.J.Perazzo, S.L.Reich, M.Saraceno.
Z. Phys. A (Germany), vol.311, no.1-2, p.135-42 (1983).
Dynamical corrections to the single particle potential are (perturbatively) evaluated. The corrections to m^*/m resulting from the coupling of independent (effective) fermions to collective vibrations (low energy modes) are analyzed within the NFT formalism. The results for the ^{208}Pb are discussed. (23 refs.)

70440 Shell model studies of very neutron deficient Ru and Rh nuclei. A.Amusa, R.D.Lawson (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.51
The results of shell model studies carried out on account of the recent Munich group data on the high spin states of the neutron deficient ^{94}Ru and ^{95}Rh nuclei are presented. In the studies, ^{88}Sr is regarded as a closed core and proton configurations are restricted to the $(2p_{1/2}1g_{9/2})^n$ model space as Gloeckner and Serduke did in fitting the low spin data of these nuclei in 1974. Detailed structures of the various energy levels as well as gamma-decay transition rates between the levels were obtained. A comparison of the theoretical and experimental energy levels is shown. Apart from the disagreement between theory and experiment in the depopulation of the yrast 9^- state in ^{94}Ru, all the results agree with experimental spin assignments and decay modes. (3 refs.)

70441 High spin states and discrete line spectroscopy of ^{128}ce. J.L.S.Carvalho, R.M.Ronningen (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA), N.R.Johnson, J.S.Hattula, I.Y.Lee, M.P.Fewell, L.L.Riedinger, H.Ower, J.C.Wells, F.M.Bernthal.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.52
Nuclear shapes in the A~130 region are transitional between prolate-deformed and spherical. In such regions anomalous behavior in the yrast sequence (backbending) at high annular momentum results from the crossing of the ground state rotational band by an aligned quasiparticle band. In the deformed rare-earth region the quasiparticle band is composed of $i_{13/2}$ neutron states. But, in the A~130 region $h_{11/2}$ protons are involved. To investigate the role of the $h_{11/2}$ proton in this region the authors have studied ^{128}Ce. Levels in this nucleus were populated in the ^{112}Cd(^{20}Ne,4n) reaction at 103 MeV using the ORNL isochronous cyclotron. Seven Ge γ-detectors were used, all in the reaction plane. Two large NaI detectors, one placed above the target and one below, acted together as a total γ-ray energy spectrometer for reaction channel selection. The yrast sequence was observed to spin 24, and a strong back bend occurs around $\hbar\omega=0.31$ MeV. Two sidebands having two-quasiparticle nature were also observed, with bandheads at 1890 and 1989 keV. The former is tentatively assigned as the $h_{11/2}$ two quasi-proton band. (no refs.)

70442 High spin states in ^{129}Ce. R.Aryaeinejad, A.H.Nelson, D.J.G.Love, P.J.Nolan, P.J.Twin (Oliver Lodge Lab., Univ. of Liverpool, Liverpool, England), J.D.Garrett, G.B.Hagemann, B.Herskind.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.53
High spin states in ^{129}Ce have been studied using an ^{16}O beam on ^{116}Sn and ^{117}Sn targets at energies of 75 and 85 MeV, respectively. For the ^{117}Sn reaction, gamma-gamma coincidence data are obtained using an array of four escape suppressed Ge(Li) detectors on conjunction with 14 element bismuth germanate (BGO) sum energy and multiplicity spectrometer. The BGO spectrometer enables us to select the desired reaction channel. Two positive parity bands as well as two negative parity bands were observed in ^{129}Ce. The ambiguities about the relative positions of the positive and negative parity bands have also been resolved. All four bands show a strong first backbend at a rotational frequency of $h\omega=0.32$ MeV. This band crossing has been seen in ^{130}Ce and ^{131}Ce at the same frequency, but has not been observed in the odd proton nucleus ^{127}La, which indicates the alignment is due to $h_{11/2}$ protons. (2 refs.)

70443 Observations of large differences between mass and charge excitation of collective states. G.Graw, H.Clement, H.Kader, F.Merz, P.Schiemenz, N.Seichert (Sektion Phys., Univ. Munchen, Garching, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.57
Most of our precise knowledge about natural parity transition strengths to or between excited collective nuclear states results from electromagnetic processes and is thus restricted to the observation of changes in the charge distribution. Inelastic scattering of polarized deuterons with energies near 20 MeV allows for a rather reliable determination of the corresponding mass transition moments of light and heavy nuclei. In addition the authors investigated shell structure effects on proton-closed shell nuclei ^{18}O and ^{64}Ni and on the doubly-closed shell nucleus ^{48}Ca. (2 refs.)

70444 Microscopic study of molecular bands and their crossing. K.Kato, S.Okabe, Y.Abe (Dept. of Phys., Hokkaido Univ., Sapporo, Japan).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.74
The authors calculate energy spectra of the ^{28}Si nucleus by the use of semimicroscopic ^{12}C+^{16}O molecular wave functions and show that there exist molecular rotational bands and their crossing at the energy almost equal to that assumed in the phenomenological analysis. The speculation is disproved that the band crossing model (BCM) is not applicable to systems involving the strongly deformed ^{12}C nucleus. (3 refs.)

21.10D Binding energy and masses

70445 Observation and mass measurement of ^{69}Ni. M.Bernas, Ph.Dessagne, M.Langevin, F.Pougheon, P.Roussel (Inst. de Phys. Nucleaire, Orsay, France), G.C.Morrison.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.54
Masses and properties of neutron rich medium mass nuclei are relevant for the knowledge of nucleosynthesis processes. Besides, the role of the proton shell closure on the nuclear well and the predictive power of mass formulae can be followed on the heavier Ni isotopes. The authors have recently studied the ^{68}Ni nuclei with ^{70}Zn(^{14}C, ^{16}O) reaction (1981): mass has been remeasured and first excited level has been shown to be 0^+. They now report on the first observation and mass measurement of ^{69}Ni. Five mass units heavier than the last stable isotope, it is populated with the ^{70}Zn(^{14}C, ^{15}O) transfer reaction. 21.10F Shape, charge, radius and form factors

70446 Two-rotor model of deformed nuclei. G.de Franceschi, F.Palumbo (Laboratori Nazionali di Frascati, Istituto Nazionale di Fisica Nucleare, Frascati, Italy), N.Lo Iudice.
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.2, p.61-5 (14 May 1983).
The two-rotor model of deformed nuclei, already studied for $N=Z$, is reformulated using a more appropriate quantization procedure and extended to the case $N\neq Z$. While the neutron excess effects are negligible, the different quantization procedure has the effect of halving the excitation energy of the collective $M1$ state. (5 refs.)

70447 Deformation correlation effects in the ^{154}Sm-^{144}Sm neutron density difference. L.Ray (Dept. of Phys., Univ. of Texas, Austin, TX, USA), M.M.Gazzaly.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.309-13 (5 May 1983).
The second order Kerman, McManus and Thaler optical potential model (1959) is used in the analysis of 800 MeV proton elastic scattering data from ^{144,154}Sm. Correlation terms arising from the large intrinsic deformation of ^{154}Sm are included and are found to be quite significant. Neutron isotopic density distribution and RMS radius differences are determined and are seen to be in good agreement with deformed basis, Hartree-Fock predictions. (28 refs.)

70448 The mean free path of protons in nuclei and the nuclear radius. R.Dymarz, T.Kohmura (Nuclear Phys. Lab., Oxford, England).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.446-50 (12 May 1983).
The authors determine the mean free path of protons in nuclei in the energy range 40-1000 MeV. They find that it is necessary to use in the calculation of the mean free path the nuclear radius R which reproduces the reaction and total cross sections consistently and that this radius leads to a rather small mean free path which is comparable with the value obtained in the microscopic calculation in the whole energy region. (29 refs.)

70449 Electroexcitation of 2^+ and 4^+ states in ^{28}Si: a test of the renormalized shell model. S.Yen, B.O.Pich, T.E.Drake (Dept. of Physics, Univ. of Toronto, Ontario, Canada), C.F.Williamson, S.Kowalski, C.P.Sargent.
Phys. Lett. B (Netherlands), vol.124B, no.6, p.471-3 (12 May 1983).
The electromagnetic form factors of the lowest five 2^+ and the lowest two 4^+ states in ^{28}Si are measured via high-resolution electron scattering for the first time. Comparison with the renormalized shell model calculations of Chung (1973) and Wildenthal (1978) reveals deficiencies in the shell model description of these states. (6 refs.)

21.10H Spin, parity, and isobaric spin

70450 The parity violating rotation of the neutron spin in helium. V.F.Dmitriev (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark), V.V.Flambaum, O.P.Sushkov, V.B.Telitsin.
Phys. Lett. B (Netherlands), vol.125B, no.1, p.1-4 (19 May 1983).
The spin rotation angle for transversally polarized neutrons in liquid helium is calculated. The result is expressed in terms of a parity violating nucleon-nucleon interaction taken in the one-boson exchange approximation. For reasonable parameters of the interaction the spin rotation angle is equal to $\phi=(-0.1\pm1.5)\times10^{-6}$ rad/m. (18 refs.)

21.10M Level density and structure

70452 Level structure of ^{106}Mo. K.Shizuma (Faculty of Engng., Hiroshima Univ., Hiroshima, Japan), H.Lawin, K.Sistemich.
Z. Phys. A (Germany), vol.311, no.1-2, p.71-8 (1983).
The level scheme of the very neutron rich nucleus $_{42}{}^{106}$Mo$_{64}$ has been studied for the first time through the β decay of ^{106}Nb. Six new excited states were observed in γ singles and γ-γ coincidence experiments in addition to the 2^+, 4^+ and 6^+ members of the ground state band. The excitation energies and the deexcitation pattern suggest the interpretation of the levels at 710, 885 and 956 keV as the $2_2{}^+$, $3_1{}^+$ and $0_2{}^+$ states, respectively. The data support the assumption of a non-axial deformation of ^{106}Mo. A half-life of (1.02 ± 0.05) s has been determined for the β decay of ^{106}Nb. (20 refs.)

70453 The 8^+ levels of ^{86}Zr revisited. C.A.Fields, F.W.N.de Boer (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).
Z. Phys. A (Germany), vol.311, no.1-2, p.127-30 (1983).
The 33 MeV ^{86}Sr(^{3}He, $3n\gamma$) reaction has been used to remeasure the level structure of the $N=46$ nucleus ^{86}Zr. The lowest 8^+ level is found at 3297.5 keV, consistent with some but not all earlier studies. On the basis of spectroscopic measurements and data-to-data comparisons with other $N=46$ nuclei, the 3531.8 keV level is also suggested as an 8^+. (11 refs.)

70454 Shell-model relationships between negative-parity states of even-mass $A=30$-40 nuclei. J.H.van der Merwe, R.Saayman (Dept. of Phys., Univ. of Stellenbosch, Stellenbosch, S Africa), A.J.van der Merwe.
Z. Phys. A (Germany), vol.311, no.3, p.225-41 (1983).
Simple relationships between the negative-parity energy level structures of the even-mass nuclei pairs $A=30$ and 32, 34 and 40, 34 and 36, 34 and 38, 40 and 38 are established along lines similar to the well-known Pandya transformation between the particle-hole spectrum of ^{40}K and the particle-particle spectrum of ^{38}Cl. The relationships are generated within the framework of the *jj*-coupling shell model, using standard Racah algebra, and no assumption is made about the physical nature of the nuclear two-body interaction. Candidates for the $1f_{7/2}$ and $2p_{3/2}$ multiplets are selected on the basis of their measured spectroscopic strengths in $l=3$ or 1 single-particle transfer reactions with due allowance for member fragmentation and mixing between the two configurations in terms of the calculation of spectroscopic-strength weighted centroids. The calculated correlated energy spectra are discussed with reference to the results of previous interaction-dependent shell-model calculations, especially those employing the modified surface delta interactions. Consideration is also given to uncertain or ambiguous spin and parity assignments, deduced two-body interaction matrix elements, and the isospin $T=0$ and 1 and single-particle $1f_{7/2}$ and $2p_{3/2}$ splittings. (39 refs.)

70455 Identification of levels in ^{24}Mg populated in the reaction ^{12}C(^{14}Nd,d)^{24}Mg. H.U.Gersch, E.Hentschel, F.Herrmann, H.Schobbert, D.Wohlfarth (Central Inst. of Nuclear Res., Rossendorf, Germany), W.Goldberg, M.Golowkow.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.56
The authors investigate the reaction ^{12}C(^{14}N,d)^{24}Mg(α)^{20}Ne to study the ^{12}C-transfer and the nuclear structure of ^{24}Mg. (5 refs.)

70456 Microscopic potential overlap for (^{7}Li,t) reactions. K.F.Pal, R.G.Lovas, T.Vertse (ATOMKI, Debrecen, Hungary).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.64
The reliability of (^{7}Li,t) reactions as spectroscopic tools depends on the goodness of the ^{7}Li wave functions used. This function enters into the DWBA amplitude through the potential overlap $\phi(r)=(7!/3!4!)^{1/2}<\Phi_\alpha\Phi_t|V_{\alpha-t}|\Phi_{Li}>_r$, where Φ are the (antisymmetrized) internal wave functions, $V_{\alpha-t}$ is the sum of the internucleon forces that act between the two fragments, and r is the distance of their c.m. The usual phenomenological approach postulates a local two-body force $U_{\alpha-t}(r)$ and replaces ϕ by $\phi_L(r)=U_{\alpha-t}(r)u(r)$, where u is the bound-state wave function in $U_{\alpha-t}$ of the proper quantum numbers and separation energy. The authors report their calculation of ϕ in the generator coordinate model (GCM) and its application to the ^{12}C(^{7}Li,t)^{16}O(0^+, 6.05 MeV) transition. (4 refs.)

70457 $\alpha+^{14}$C dinuclear molecular band in ^{18}O: a new perspective into heavy ion scattering resonant phenomena. M.Gai, M.Ruscev, A.C.Hayes, J.F.Ennis, R.Keddy, E.C.Schloemer, S.M.Sterbenz, D.A.Bromley (A.W. Wright Nuclear Structure Lab., Yale Univ., New Haven, CT, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.75
Transient nuclear molecules formed during heavy ion collisions are now proposed to exist throughout the periodic table, even in the case of U+U collisions. Such two body molecular state should be characterized by a dipole rather than a quadrupole degree of freedom as in the case of collective states in even-even nuclei. The ‘diatomic molecular band; based on such a dipole molecular state would have spin sequence, 0^+, 1^-, 2^+, 3^-, 4^+, ... and enhanced E1 transitions connecting these states. Recently, a molecular sum rule has been derived for the intensity of these transitions. That study also predicts enhanced E2 cross-over transitions which also would reflect the peculiar deformation of the molecular state. The authors have studied $\alpha+^{14}$C states in ^{18}O. Two different experiments: ^{14}C(^{7}Li,tγ)^{18}O coincidence measurements and ^{14}C(α,γ)^{18}O radiative capture studies were used to study all the decay modes of all states in ^{18}O up to 8.3 MeV in excitation. 21.30 NUCLEAR FORCES

(see also 13.75C Nucleon-nucleon interactions)

70458 Axial meson exchange current effects in deuterium in the current algebra approximation. J.Adam,Jr., E.Truhlik (Inst. of Nuclear Phys., Czechoslovak Acad. Sci., Rez, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.5, p.558-67 (1983).
The axial meson exchange current effects are studied in reactions of muon capture in deuterium and deuterium disintegration by the reactor antineutrinos. The exchange current operator is constructed using the weak production amplitude of the pion in the current algebra approximation. The results are compared with the hard pion method. (14 refs.)

70459 Meson-exchange Hamiltonian for *NN* scattering up to 1 GeV and Δ-nucleus dynamics. T.-S.H.Lee (Argonne Nat. Lab., Argonne, IL, USA).
Phys. Rev. Lett. (USA), vol.50, no.20, p.1571-4 (16 May 1983).
A Hamiltonian for π, N, and Δ is constructed from meson-exchange mechanisms. The NN interaction in the model is directly derived from the Paris potential. Good fits to *pp* scattering data up to 1 GeV, including the ‘resonant’ $^1D_2$ and $^3F_3$ partial waves, have been obtained when a $\pi N\rightleftarrows\Delta$ interaction is introduced in a dynamical three-body approach. The model can be used for a many-body study of Δ-nucleus dynamics. (12 refs.)

70460 The quark model and the nucleon-nucleon interaction. A.Faessler, F.Fernandez (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.145-8 (28 April 1983).
The quark model and the resonating group method are used to calculate the nucleon-nucleon ^{3}S and ^{1}S phase shifts. The short range part of the N-N interaction is described by quark and gluons exchange between two three-quark clusters. For the long range part standard OBE (included only π and σ mesons) is used. The form factors of the OBE potential are calculated from the wave function of the three quark clusters using r-dependent quark-meson couplings. This ensures that the mesons couple to the quarks only on the surface region of the nucleons. The calculated phase shifts agree surprisingly well with the data. (13 refs.)

70461 The meson and quark-gluon degrees of freedom in NN-interaction at low and intermediate energies. A.N.Safronov (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.149-51 (28 April 1983).
A set of nonsingular integral equations has been formulated to calculate the partial amplitudes of hadron-hadron scattering at low and intermediate energies making allowance for the meson and quark-gluon degrees of freedom.

The results are presented of the calculations of the np effective range parameters and of the np scattering $^1S_0$- and $^3S_1$-phase shift at incident nucleon energies ranging from 1 to 1050 MeV. (9 refs.)

70462 **Nucleon recurrences in the cloudy bag model.** E.Umland, I.Duck (T.W. Bonner Nuclear Labs., Rice Univ., Houston, TX, USA).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.284-6 (5 May 1983).
The spectrum of nucleon recurrences in the 1-2 GeV region is analyzed in the context of the Cloudy Bag Model. The (1470) Roper resonance is required to be two $(1s)^2$ 2s three quark states split by ~100 MeV. The $P_{11}(1710)$ can be accommodated as a $(1s)^3$+TE gluon state. (17 refs.)

70463 **Potential pockets in the $^{238}U+^{238}U$ system and their possible consequences.** M.J.Rhoades-Brown (Phys. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), V.E.Oberacker, M.Seiwert, W.Greiner.
Z. Phys. A (Germany), vol.310, no.4, p.287-94 (1983).
Within the double-folding model the separation, shape, and orientation dependence of the interaction potential is studied for two heavy ions. An effective nucleon-nucleon interaction (M3Y) derived from *G*-matrix elements and based upon the Reid soft-core potential is used. Deformed Fermi-type matter densities with static quadrupole and hexadecapole deformations were utilized. The model is applied to the $^{238}U+^{238}U$ system and shows dramatic dependence on the deformations and orientations. (27 refs.)

21.60 NUCLEAR-STRUCTURE MODELS AND METHODS

(for hadronic atoms and molecules, see 36.10)

70464 **On the neutron excess $(N-Z)$ and a periodic table for atomic nuclei.** A.Shima (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan).
Rep. Inst. High Speed Mech. Tohoku Univ. Ser. B (Japan), vol.46, p.49-57 (1983).
It is shown by equations that the proton numbers (or neutron numbers) where atomic nuclei become extremely stable, what are called magic numbers 2, 8, 20, 28, 50, ...(including comparatively stable numbers 6, 14, 40 etc.) can be expressed by two sequences of numbers. Also a periodic table for atomic nuclei where sequences of numbers are respectively put into one group as well as in the case of a periodic table of elements is presented. From the obtained table it is found that a definite rule exists between neutron excess $(N-Z)$ and Z, and a mathematical formulation for it is made. (11 refs.)

70465 **Single particle response in finite nuclei.** S.Shlomo (Dept. of Phys., Texas A&M Univ., College Station, TX, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.59
Simple expressions for the single-particle response (structure) function $S(E,q)$ and its sum rule, (Pauli blocking factor) $P(q)=\int dES(E,q)$, are derived in terms of the Wigner transforms (WTs) of the single-particle wave functions and the scattering probe $\sigma(\vec{q},\vec{r})$. Considering the WT as a quantum-mechanical analog of classical phase-space distribution function, these expressions have a simple phase-space interpretation. Using the Born approximation for $\sigma(\vec{q},\vec{r})$ and assuming independent nucleons in a harmonic oscillator potential well, simple analytic expressions are derived from $S(E,q)$ and $P(q)$. These results are compared with the well-known results for an infinite Fermi gas. (4 refs.)

21.60C Shell model

70466 **Shell model basis of the interacting boson model.** I.Talmi (Weizmann Inst. of Sci., Rehovot, Israel).
Comments Nucl. & Part. Phys. (GB), vol.11, no.6, p.241-9 (1983).
The interacting boson model is related to shell model states constructed from pairs of identical valence nucleons coupled to $J=0$ and $J=2$. States of several such pairs with given generalized seniorities correspond to states of proton and neutron *s* and *d* boson states. The strong and attractive quadrupole interaction between protons and neutrons has large matrix elements between states constructed from such proton and neutron pairs (*S-D* space). Boson states which correspond to states in the *S-D* space can be used to diagonalize an equivalent boson Hamiltonian. In certain cases, states and operators of the proton and neutron *s*, *d* boson model (IBA-2) can be well approximated by the simpler version with one kind of *s* and *d* boson (IBA-1). (25 refs.)

21.60E Collective models

70467 **A canonical coordinate system suitable for adiabatic treatment of collective motion: an illustrative model.** A.Kuriyama (Dept. of Phys., Kyushu Univ., Fukuoka, Japan), M.Yamamura.
Prog. Theor. Phys. (Japan), vol.69, no.2, p.681-4 (Feb. 1983).
With the aid of the canonicity condition, the authors specify a canonical coordinate system suitable for the adiabatic treatment of 'large' amplitude collective motion. They introduce a double transformation in order to specify a time-dependent Slater determinantal state. This specification follows that given by Baranger and Veneroni (1978). The utility of the canonicity condition is shown with the use of an illustrative model. (7 refs.)

70468 **The adiabatic approximation.** D.Brink (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England), G.Schutte.
Z. Phys. A (Germany), vol.310, no.4, p.307-15 (1983).
In large amplitude nuclear deformation the role of level crossings or pseudo-crossings of intrinsic levels is an outstanding problem. A model consisting of a harmonic oscillator as a collective part and a spin whose orientation energy depends on the collective coordinate is studied in order to clarify this problem. Especially the time-independent stationary state problem is discussed. Various perturbational expansions are presented and conditions for their convergence are given. The adiabatic approximation leading to a renormalization of the collective mass due to the level crossing is valid for vibrations with energies small compared to intrinsic energy differences. (13 refs.)

21.60F Models based on group theory

70469 **Three limits in the interactions of the *s*, *d*, and *g* bosons.** Ling Yin-sheng (Jiangsu Teachers' Coll., China).
Chin. Phys. (USA), vol.3, no.1, p.86-100 (Jan.-March 1983). [received: May 1983]
In the IBM, when *s*, *d*, and *g* bosons are present, the boson Hamiltonian has the structure of group U(15). This paper deals with the various chains of subgroups of group U(15). Especially, the following chains: $SU(15)\supset SU(3)\supset SO(3)$, $SU(15)\supset SU(5)\supset SO(5)\supset SO(3)$, $U(15)\supset U(14)\supset SO(5)\supset SO(3)$ are studied in detail. The formulas of the energy spectra are also given. (8 refs.)

70470 **The effective interaction between interacting bosons.** Zhou Xiao-qian (Jiangsu Normal Coll., China).
Chin. Phys. (USA), vol.3, no.1, p.107-17 (Jan.-March 1983). [received: May 1983]
In the normal version of IBM, only the existence of the *p-p* boson and the *n-n* boson is assumed. Later on, Elliott and White attempted to consider the *p-n* boson and employed the isospin. The above-mentioned three kinds of bosons form an isospin triplet. They advocated that the effective Hamiltonian is isospin SU(2) invariant. In this article, the authors have the view that the Hamiltonian contains, besides the isoinvariant part, also a nonisoinvariant part. From the fact that IBM accounts for the low-lying levels of nuclei successfully, one can make some conclusion about the relations among the parameters occurring in the effective interaction. The original version of IBM and the Elliott-White theory are limiting cases of the present work. If IBM can also be applied to odd-odd nuclei, a special type of spectrum can be predicted. It seems that such kind of spectrum does appear in the experiments for a number of odd-odd nuclei. (9 refs.)

21.60J Hartree-Fock and random-phase approximations

70471 A microscopic approach to fluid dynamics of nuclear collective motions. M.Di Toro (Theoretical Phys., Tech. Univ. of Munich, Garching, Germany), G.Giansiracusa, U.Lombardo.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.58
The fluid dynamics approach seems to be a powerful tool to understand collective motions in nuclei in terms of macroscopic quantities as local density, current and pressure tensor. The aim of this contribution is to show how it is possible to get fine results along this line without the need for big calculations. The starting point is the TDHF equation for the Wigner transform $f(\underline{r},\underline{p},t)$ of the one body density matrix. (5 refs.)

21.65 NUCLEAR MATTER

70472 Tensor component of the relativistic field in nuclear matter. M.Jaminon (Inst. of Phys., Univ. of Liege, Liege, Belgium).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.15, p.481-2 (9 April 1983).
In a relativistic description of nuclear matter, the most sophisticated microscopic calculations provide a relativistic potential which is the sum of only three well-defined Lorentz components a scalar (U_s), the time-like (U_0) and the spacelike (U_v) components of a vector. A Dirac equation which also includes a tensor component is discussed. (4 refs.)

70473 Anharmonic effects and pre-critical phenomena in pion condensation. M.C.Ruivo, C.A.Sousa, L.P.Brito (Dept. de Fisica, Univ. de Coimbra, Coimbra, Portugal).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.542-56 (Feb. 1983).
Pre-critical behaviour of neutron matter associated with pion condensation is investigated, in the framework of the generator coordinate method. The instability of the normal phase against charged and neutral condensation is described with Gaussian and harmonic approximation. The relevance of anharmonic corrections due to the Pauli principle is discussed, for the case of π^- condensation. (19 refs.)

70474 Flavour nuclei and one-boson-exchange potentials. H.Bando (Div. of Math. Phys., Fukui Univ., Fukui, Japan), S.Nagata.
Prog. Theor. Phys. (Japan), vol.69, no.2, p.557-64 (Feb. 1983).
Binding energies of a flavour baryon Λ (strange), Λ_c (charmed) and Λ_b (beauty), in nuclear matter and in the α-particle are investigated within the framework of the lowest-order Brueckner theory by employing the OBE potentials derived on the basis of the Nijmegen model *D* interaction. (15 refs.)

70475 Bound states of negative pions and neutrons. H.Garcilazo (Phys. Dept., Texas A&M Univ., College Station, TX, USA).
Phys. Rev. Lett. (USA), vol.50, no.20, p.1567-70 (16 May 1983).
By use of standard forms for the various interactions of a system of N neutrons and Z negative pions, it is shown that for a large variety of values of N and Z the system can become bound. This gives rise to a structure similar to that of an ordinary nucleus, but in which the protons are replaced by negative pions. (15 refs.)

70476 A simple determination of the nuclear surface symmetry energy. H.Krivine, J.Treiner (Div. de Phys. Theorique, Inst. de Phys. Nucleaire, Orsay, France).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.127-30 (28 April 1983).
Energy density formalism calculations in semi-infinite nuclear matter are performed. Using the Euler equations, one derives a simple and accurate expression for the surface-symmetry energy, which only involves, besides the surface properties of a symmetric semi-infinite medium, the symmetry energy in a uniform medium. (13 refs.)

70477 Thermostatic properties of semi-infinite symmetric nuclear matter. M.Barranco, M.Pi, X.Vinas (Facultad de Fisica, Univ. de Barcelona, Barcelona, Spain).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.131-4 (28 April 1983).
The thermal evolution of surface thickness and surface free energy of semi-infinite symmetric nuclear matter have been computed using a hot Thomas-Fermi model. Performing a leptodermous expansion of the total free energy, approximated analytical formulas for these quantities have been obtained. (11 refs.)

70478 Low temperature expansions in a relativistic mean field approach. A.Bouyssy, S.Marcos (Div. de Phys. Theorique, Inst. de Phys., Nucleaire, Orsay, France).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.139-44 (28 April 1983).
Starting from the relativistic mean field approach of Walecka (1981) which describes known properties of cold nuclear matter, finite temperature corrections and their low temperature expansions are calculated for the equation of state, the baryon effective mass, the bulk modulus and the symmetry energy coefficient. Simple analytical formulas are obtained and discussed as well as possible extensions of the model. (20 refs.)

70479 Variational calculation of nonuniform spin-ordered neutron matter including Δ isobar mixing. O.Benhar (Phys. Lab., Istituto Superiore di Sanita, Rome, Italy).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.305-8 (5 May 1983).
A modified two-nucleon interaction describing the effect of $\Delta(1236)$ isobar mixing into neutron states has been used in a Jastrow-like variational calculation of nonuniform spin-ordered neutron matter. The results indicate that, at a density larger than normal nuclear density by a factor 3-4, a transition to the inhomogeneous phase, associated with a neutral pion condensate, takes place. (20 refs.)

21.80 HYPERNUCLEI

70480 Ξ hypernuclei. C.B.Dover (Brookhaven Nat. Lab., Upton, NY, USA), A.Gal.
Ann. Phys. (USA), vol.146, no.2, p.309-48 (1 April 1983).
The authors consider the possibility of forming doubly strange Ξ hypernuclei via the (K^-, K) reactions on various nuclear targets. Because of the high momentum transfer involved, even at 0°, the formation of high spin states is strongly favoured. The available experimental information on the elementary processes $K^-p \to K^+\Xi^-$ or $K^0\Xi^0$ is reviewed, leading to the determination of an optimum incident K^- momentum of about 1.9 GeV/c for the forward formation of discrete Ξ hypernuclear states. The cross section for the process $\Xi N \to \Lambda\Lambda$, responsible for the damping width of Ξ states in nuclei, is estimated theoretically and the very limited experimental data are also reviewed. The resulting Ξ hypernuclear widths are of order 5 MeV. Emulsion data which have been interpreted as due to the existence of $\Lambda\Lambda$ and Ξ^- hypernuclei are discussed and used to obtain an approximate Ξ nuclear well-depth of 21-24 MeV. For this range of values, spectra of single particle Ξ^- states are obtained, and calculated angular distributions for the formation of simple Ξ^- particle-proton hole states in ^{4}He, ^{12}C and ^{28}Si targets are presented. The peak 0° lab cross section at $p_{lab}=1.9$ GeV/c for such states ranges from tens of nb/sr to about 1 μb/sr. The authors briefly mention other methods for forming Ξ hypernuclei, such as the three body reaction $K^-N \to K\pi\Xi$ (or $K^-p \to K^+K^0\Omega^-$ for Ω^- hypernuclei). (41 refs.)

23.00 RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS

(see also 82.55 Radiochemistry)

23.20 ELECTROMAGNETIC TRANSITIONS

70481 Study of nuclear transitions from aligned states using the example of octupole bands in actinides. I.N.Mikhailov, Ch.Brianson (Joint Inst. of Nuclear Res., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.12-22 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.849-59 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
The negative-parity states of deformed nuclei can be schematically subdivided into octupole vibrational and two-quasi-particle bands. A high degree of collectivity of the $K^\pi=0^-$, 1^- and 2^- states was found in calculations performed according to the random-phase method. The effects of coupling with rotation have a strong influence on the properties of the vibrational states even at very moderate values of the total angular momentum I. The alignment of the vibrational angular momentum in negative-parity states of nuclei from the actinide region is manifested earlier than the alignment of the internal angular momenta associated with quasi-particle motion. At present a fairly rich experimental material including data on both the spectra and the decay properties of negative-parity states over a wide range of angular momenta has been accumulated, and this allows an attempt to be made at studying the principal regularities for nuclear transitions from aligned states. The authors solve this problem using a simple phenomenological model of the nucleus which allows much of the experimental data to be described. (20 refs.)

70482 γ-decay of the states of ^{55,56}Fe excited in the (n,xnγ) reaction on ^{56}Fe at $E_n=14.6$ MeV. S.Hlavac, P.Oblozinsky, R.Antalik (Phys. Inst., Acad. of Sci., Bratislava, Czechoslovakia).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.64-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.903-5 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
The (n,xnγ) reaction at neutron energies of 14 to 15 MeV provides a good possibility for the investigation of various methods of the decay of excited states of nuclei. In order to study this reaction on ^{56}Fe (x=1 or 2) the authors created a unit which operated on a neutron beam. The theoretical calculations of the probability of transitions and of the average multiplicity of the γ-quanta were performed within the framework of the statistical model of nuclear reactions. They used a somewhat expanded STAPRE program which includes consideration of the preequilibrium emission of the first nucleon, realistic decay schemes and γ-radiation at all stages of the reaction. Standard parameters and the M. Kavai optical potential specially chosen for ^{56}Fe were used. The cross sections for 14 discrete transitions in the (n,n'γ) (n,2n) channels and the corresponding decay schemes are given. (4 refs.)

70483 Angular distributions of γ-quanta from the ^{93}Nb(n,n′γ) reaction. V.D.Avchukhov, K.A.Baskova, V.A.Bondarenko, A.B.Vovk, L.I.Govor, A.D.Demidov (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.111-15 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.947-51 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
The spectrum of γ-quanta from the ^{93}Nb(n,n′γ) reaction was measured along with their angular distributions, the diagram of the levels was refined, and the angular momenta and mixtures of multipoles δ were determined. (20 refs.)

70484 Multiplicity of gamma-ray transitions in the reaction ^{160}Gd(^{16}O,xn)$^{176-x}$Hf. I. B.F.Petrov, V.V.Kamanin, J.Rudiger, S.P.Ivanova, O.E.Kraft, Yu.V.Naumov, V.V.Kobekov, V.A.Loshchenko (Sci. Res. Inst. of Phys., Leningrad State Univ., Leningrad, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.7, p.205-11 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.7, p.1431-7 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
The system of multiple integral equations that was described in detail by Petrov et al. (1980) is employed to investigate high-spin states populated in the ^{160}Gd(^{16}O,xn)$^{176-x}$Hf reaction. Measurements were conducted for ^{16}O energies from 5 to 9 MeV/nucleon. (11 refs.)

70485 Nuclear orientation of ^{147}Tb ($T_{1/2}$=1.7h), ^{149}Tb ($T_{1/2}$=4.15 h) and ^{151}Tb ($T_{1/2}$=17.7 h) in a gadolinium host. I.Prochazka, J.Konicek, M.Finger, A.Jankech, T.I.Kracikova, P.Simecek, V.M.Tsupko-Sitnikov (Joint Inst. for Nuclear Res., Dubna, USSR), W.D.Hamilton, J.Muhonen.
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.5, p.540-8 (1983).
Radioactive ^{147}Tb ($T_{1/2}$=1.7 h), ^{149}Tb ($T_{1/2}$=4.15 h) and ^{151}Tb ($T_{1/2}$=17.7 h) nuclei were oriented in a gadolinium host at low temperatures. Angular distributions of prominent gamma-rays were found to be isotropic within the experimental errors. This is consistent with the 1/2-spin assignments to all three parent states. (28 refs.)

70486 γ-radiation in the reaction ^{143}Nd (n,n′γ) using fast neutrons from a reactor. V.A.Bondarenko, I.L.Kuvaga, P.T.Prokof'ev.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.1, p.3-8 (1983). In Russian.
The γ-radiation spectrum in the reaction ^{143}Nd ($n,n'\gamma$) with the target of Nd_2O_3 enriched up to 83% ^{143}Nd has been measured at an angle of 90° to the neutron beam by a Ge(Li) detector. The energies and intensities of the 86 γ-transitions, which are placed in a scheme consisting of 37 levels, have been determined in the energy range from 90 to 2600 keV. The characteristics of the following levels are defined more exactly: 1228.29 ($13/2^+$), 1407-28 ($9/2^-$), 1431.49 ($11/2^-$), 1739.12 ($9/2^-$), 1851.96 ($7/2^-$, $9/2^-$), 1852.78 ($3/2^-$), 1910.74 ($5/2^-$), 1988.24 ($11/2^-$), 2011.49 ($7/2^-$), 2019.17 ($15/2^+$), 2075.39 ($11/2^+$), 2094.53 ($11/2^-$), 2135.17 ($7/2^-$), 2186.43 ($7/2^-$), 2197.31 ($11/2^-$), 2398.85 ($7/2^-$, $9/2^-$), 2483.42 ($11/2^+$, $13/2^+$) 2556.67 ($5/2^-$, $7/2^-$). Unplaced transitions suggest the existence of several unknown levels with I=5/2-9/2 in the energy interval from 2.5 to 3.0 MeV, which arise in the given reaction. (11 refs.)

70487 The γ-spectrum of ^{156}Gd from the inelastic scattering of fast neutrons. Ya.Ya.Berzin', T.V.Guseva, Yu.Ya.Tamberg.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.1, p.9-12 (1983). In Russian.
The γ-spectra of ^{156}Gd have been measured in the (n,n′γ) reaction of the reactor's fast neutron beam at energies ranging from 70 to 2900 keV. The 17 g Gd_2O_3 target enriched in ^{156}Gd to 95.5% has been used. The energies and intensities of 280 γ-transitions have been determined. (15 refs.)

70488 Disproof of the alleged two-phonon character of the $0_2{}^+$ state in ^{64}Zn. A.Passoja, J.Kantele, M.Luontama, J.Kumpulainen, R.Julin, P.O.Lipas, P.Toivonen (Dept. of Phys., Univ. of Jyvaskyla, Jyvaskyla, Finland).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.157-60 (28 April 1983).
A study of electromagnetic transitions from the $0_2{}^+$ and $0_3{}^+$ states in ^{64}Zn clearly shows that the quadrupole-phonon model is insufficient for this nucleus. All reported shell-model, cluster-vibration-model and advanced IBA calculations also fail to reproduce the decay branching ratios from the $0_2{}^+$ state. However, they are qualitatively explained by the O(6) limit of the IBA and fairly well quantitatively by a six-parameter IBA-1 fit. (24 refs.)

70489 Combined analysis of inelastic electron-scattering and muonic-atom hyperfine-splitting data: an application to ^{152}Sm. W.Reuter, E.B.Shera, H.D.Wohlfahrt (Los Alamos Nat. Lab., Los Alamos, NM, USA), Y.Tanaka.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.293-6 (5 May 1983).
Explores a method for combined analysis of inelastic electron-scattering data and muonic quadrupole hyperfine-splitting measurements. The method, applied here to ^{152}Sm, provides an accurate normalization for (e,e′) data, a precise value for $B(E2;0^+\rightarrow 2^+)$, and shows that the interpretation of the monopole (elastic) and quadrupole (inelastic) data from both experiments is consistent at the present level of experimental accuracy. (14 refs.)

70490 Decay properties of low-lying levels in ^{100}Rh. A.M.Bizzeti Sona, P.Blasi, P.A.Mando' (Istituto di Fisica, Univ. di Firenze, Firenze, Italy).
Z. Phys. A (Germany), vol.311, no.3, p.163-71 (1983).
Low-lying levels of ^{100}Rh have been investigated with the reaction ^{100}Ru($p,n\gamma$)^{100}Rh in the proton energy range 4.4 MeV$\leq E_p \leq$6 MeV. A level scheme including 18 previously unreported excited levels has been deduced on the basis of singles γ-spectra and extensive γ-γ coincidence measurements. The γ branchings of several levels have also been measured. By means of the pulsed beam technique, the mean lifetimes of the excited states at 151.18, 160.7, 329.4 and 389.7 keV have been determined as $\tau_m=(1.4\pm0.2)$ns, (5.7 ± 0.3) ns, (1.1 ± 0.4) ns and (0.9 ± 0.4) ns, respectively. The lifetimes of the levels at 32.7 keV and 74.8 keV have been found to be $\tau_m=(36.5\pm4.5)$ ns and (312.5 ± 7.5) ns, in good agreement with recently reported values. An upper limit of 0.5 ns has also been placed for the lifetimes of eleven other levels. (19 refs.)

70491 A probabilistic model for spectral assignment in the (n,γ) reaction. M.A.Islam, T.J.Kennett, W.V.Prestwich (Dept. of Phys., McMaster Univ., Hamilton, Ontario, Canada).
Z. Phys. A (Germany), vol.311, no.3, p.195-204 (1983).
A method has been developed to aid in determining if a particular transition in an (n,γ) reaction originated from the compound, rather than from an intermediate, state. The method is based upon a simple model which is demonstrated to be tolerant to sizeable variations in the nuclear parameters employed. The reliability of the procedure is assessed by comparing the predictions of the model with results gained through detailed analysis by others. Finally the technique is applied to some recently acquired data in order to illustrate how much information can be extracted by its use. (15 refs.)

70492 The interacting boson model applied to the mercury isotopes. A.F.Barfield, B.R.Barrett, K.A.Sage, P.D.Duval (Dept. of Phys., Univ. of Arizona, Tucson, AZ, USA).
Z. Phys. A (Germany), vol.311, no.3, p.205-15 (1983).
The even isotopes of mercury have been systematically studied using the Interacting Boson Model (IBM). In order to treat shape coexistence in the light isotopes, two separate IBM calculations were performed with different configurations, which were subsequently mixed. The four Hamiltonian parameters, which were allowed to vary freely from isotope to isotope, were found to be consistent with the corresponding IBM parameters used for platinum and osmium. Overall, the calculated energy spectra and electromagnetic properties are in reasonable agreement with experiment. (41 refs.)

23.40 BETA DECAY; ELECTRON AND MUON CAPTURE

70493 Double beta decay, massive neutrinos and lepton conservation. S.P.Rosen (Nat. Sci. Foundation, Washington, DC, USA).
AIP Conf. Proc. (USA), no.96, p.352-73 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
The phenomenon of double beta decay is reviewed and its implications for neutrino properties such as mass, right-handed currents and Majorana self-conjugacy are described. At present the only indication that the lepton number violating no-neutrino mode occurs is an indirect one based upon a comparison of ^{128}Te and ^{130}Te lifetimes. This history and latest status of this argument are discussed. Should the no-neutrino mode be observed, a whole program of experiments will be needed to determine the mechanism responsible for it. (41 refs.)

70494 Double beta decay—an experimental review. Chien-Shiung Wu (Columbia Univ., New York, NY, USA).
AIP Conf. Proc. (USA), no.96, p.374-95 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
In this review, a brief discussion on the experimental objectives and theoretical conceptions of the neutrinos was introduced. Two different types of experimental methods and their results were presented and discussed. (29 refs.)

70495 Geochemical double beta decay experiments. T.Kirsten (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
AIP Conf. Proc. (USA), no.96, p.396-410 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
Double Beta Decay provides a very sensitive test of lepton-number conservation. However, decay rates are so small that it has not yet been possible to unequivocally detect a Double Beta Decay event directly; so much the more important is the data obtained by the 'geochemical' method where one detects the Double Beta Decay products which have accumulated in natural minerals during long geological time periods. In that order, the author discusses the principles of the geochemical method, its strength and its limitations, the available data, new results on the ^{128}Te-^{130}Te system and the theoretical implications of the data concerning the electron neutrino restmass and lepton-number conservation. A limit of $m_\nu\leq$5.6 eV (95% confidence) has been obtained from our recent ^{128}Te-^{130}Te-measurements. (34 refs.)

70496 The Irvine ^{82}Se experiments. M.K.Moe, A.A.Hahn (Univ. of California, Irvine, CA, USA).
AIP Conf. Proc. (USA), no.96, p.411-18 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
The large difference in half lives implied for ^{82}Se by a cloud chamber experiment and by geochemical methods remains unresolved. The need for a definitive direct counting measurement of the 2ν double beta decay half-life, and the great interest in searching for Oν decay, have motivated the construction of a new TPC experiment sensitive to both modes. The cloud chamber and TPC experiments are briefly described. (6 refs.)

70497 Early results from the Battelle-Carolina ^{76}Ge double beta decay project. F.T.Avignone,III (Dept. of Phys., Univ. of South Carolina, Columbia, SC, USA), R.L.Brodzinski, D.P.Brown, J.C.Evans,Jr., W.K.Hensley, J.H.Reeves, N.A.Wogman.

AIP Conf. Proc. (USA), no.96, p.419-26 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

A search for no-neutrino double beta decay of ^{76}Ge using an anticoincidence shielded Ga spectrometer is reported. A new lower limit of $T_{1/2} \geq 1.7 \times 10^{22}$ y at a 90% CL was determined using a maximum likelihood analysis on a 5 keV wide energy bin centered at 2041 keV. Combining this result with the shell model calculations of Haxton, Stephenson and Strottman, the authors obtain $\bar{m}_\nu \leq 10$ eV and $|\eta| \leq 2.4 \times 10^{-5}$. (9 refs.)

70498 The status of the UCSB-LBL ^{76}Ge double beta decay experiment. M.S.Witherell (Univ. of California, Santa Barbara, CA, USA).

AIP Conf. Proc. (USA), no.96, p.427-9 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

The author describes an experiment to look for neutrinoless double beta decay in ^{76}Ge which is now under construction. Eight large high-purity germanium detectors are surrounded by an active shield of sodium iodide. The problem of reducing background sources is discussed in some detail. (1 ref.)

70499 Recent results obtained in the Mt. Blanc experiment on $\beta\beta$ decay of ^{76}Ge. E.Bellotti, E.Fiorini, C.Liguori, A.Pullia, A.Sarracino, L.Zanotti (Dipartimento di Fisica, Univ. di Milano, Milano, Italy).

AIP Conf. Proc. (USA), no.96, p.430-3 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

Results are reported of a search for double beta decay of ^{76}Ge. The experimental set-up has been running under Mt. Blanc ($\sim$5000 m w.e. depth) for 3000 hours. No evidence appears for either $0^+ \rightarrow 0^+$ or $0^+ \rightarrow 2^+$ neutrinoless transitions with half lifetime limits of $1.1.10^{22}$ and $4.2.10^{21}$ years, respectively, at 90% c.l. (9 refs.)

70500 Investigation of the decay of ^{165}Tm$\rightarrow$^{165}Er. Ts.Vylov, V.M.Gorozhankin, K.Ya.Gromov, V.V.Kuznetsov (Joint Inst. of Nuclear Res., USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.1-11 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.834-48 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).

Gives the results of new measurements of the spectra of positrons, γ-rays, internal-conversion electrons and eγ-coincidences during thes decay of ^{165}Tm. The properties of the bands and states of ^{165}Er are also given. (22 refs.)

70501 Polarization effects of currents of the second kind during β^--decay. I.Kumar, N.V.Samsonenko (P. Lumumba Internat. Friendship Univ., Moscow, USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.83-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.921-4 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).

Investigates the polarisation effects caused by currents of the second kind during β-decay assuming the principle mechanism is the β^--decay of a neutron. Relativistic corrections which take account of the dependence on the velocity of the final nucleon are derived. These results are useful in the discussion of whether terms containing currents of the second kind are present in the weak interaction hamiltonians. (9 refs.)

70502 Investigation of K X-rays which accompany the decay of ^{168}Tm$\rightarrow$^{168}Er. V.A.Sergienko, A.V.Vorontsovskii, Ya.A.Golovin.

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.108-10 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.944-6 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).

The relative intensities of the K-series X-ray lines are determined along with the relative probability of K-capture to the 1541.5 keV level of ^{168}Er. (13 refs.)

70503 Is the neutrino mass equal to 34 eV?—A discussion of the atomic effect in the β-decay of ^{3}H. Ching Cheng-rui, Ho Tso-hsiu (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).

Commun. Theor. Phys. (China), vol.1, no.1, p.11-18 (1982).

In evaluating the β-spectrum of atomic ^{3}H a more accurate formula is obtained, in which the first three transitions leading to the lowest three states of ^{3}He$^+$ are treated exactly, and the closure approximation is used to estimate the contribution from all excited states with $n > 3$. (9 refs.)

70504 Double beta decay. M.Doi (Inst. of Phys., Osaka Univ., Toyonaka, Japan), T.Kotani, H.Nishiura, E.Takasugi.

Prog. Theor. Phys. (Japan), vol.69, no.2, p.602-35 (Feb. 1983).

The double β decay is investigated by the use of the relativistic Coulomb wave function including the finite nuclear size effect. A general form of the $V \pm A$ interactions is considered. It is shown that the decay rate is enhanced considerably in comparison with the case of the plane wave multiplied by the non-relativistic Fermi factor. It is confirmed that the selection rule derived on the basis of the plane wave is still valid in the relativistic Coulomb wave case. The neutrino mass and the $V+A$ current parameters are estimated from the analysis of experimental data. (48 refs.)

70505 The 1^-(1.9 MeV β^-)2^+ transition in the decay of ^{148}Pm. O.A.Rosso (Dept. de Fisica, Univ. Nacional de La Plata, La Plata, Argentina), L.Szybisz.

Z. Phys. A (Germany), vol.311, no.1-2, p.119-26 (1983).

The non-unique first-forbidden 1^-(1.9 MeV β^-)2^+ transition in the decay of ^{148}Pm is studied. The nuclear matrix elements are evaluated using for the ground state of the odd-odd ^{148}Pm a phenomenological wave function derived by Szybisz (1975) in the framework of the two-quasiparticle model and assuming that the first excited 2^+ state in ^{148}Sm can be described as the first quadrupole phonon state. This model provides nuclear matrix elements which are capable of describing experimental data like the spectrum shape factor, the longitudinal polarization of the electrons and a particular set of β-γ directional correlation coefficients, but it fails to interpret the large log *ft* value of this transition. In addition, the validity of the ξ-approximation is discussed. (37 refs.)

23.60 ALPHA DECAY

70506 ^{164}Ta, identification of a new isotope. U.J.Schrewe, E.Hagberg, H.Schmeing, J.C.Hardy, V.T.Koslowsky, K.S.Sharma (Chalk River Nuclear Lab., AECL, Chalk River, Ontario, Canada).

Z. Phys. A (Germany), vol.310, no.4, p.295-300 (1983).

The new isotope ^{164}Ta ($T_{1/2}$=13.6(2)s) was produced in the ^{127}I(^{40}Ca,3n) reaction and transported to a measuring station by helium jet. Decay properties were observed with α, γ, and γ-γ spectroscopy. The Z assignment of the new isotope was based on γ-X-ray coincidence measurements. The mass assignment was deduced from measured excitation functions. The two γ rays assigned to the new activity most likely originate from the $4^+ \rightarrow 2^+ \rightarrow 0^+$ decay sequence in ^{164}Hf. A small α branch, $\leq$0.016(5)%, with an α decay energy of E_α=4625(15)keV was found and assigned to the decay of ^{164}Ta. The deduced upper limit of the α width for this branch, $W_\alpha \leq 0.6(2)$, is in accordance with those known for neighbouring nuclei. (17 refs.)

23.90 OTHER TOPICS IN NUCLEAR DECAY AND RADIOACTIVITY

70507 Identification of the proton drip line. G.D.Alkhazov, K.A.Mezilev, Yu.N.Novikov, A.M.Nurmukhamedov (Leningrad Nuclear Phys. Inst., Acad. of Sci., Gatchina, Leningrad, USSR), N.Ganbaatar, K.Ya.Gromov, V.G.Kalinnikov, A.Potempa, F.Tarkanyi.

Z. Phys. A (Germany), vol.311, no.3, p.245-6 (1983).

A group of proton emitters of Au, Ir, Re, Ta has been identified by means of mass values derived from the experimental data. The proton drip line has been determined. It is shown that on the boundary of the proton stability the values of proton pairing energies increase by about 50% as compared with the isotone nuclei near the beta-stability line. (8 refs.)

24.00 NUCLEAR REACTIONS AND SCATTERING: GENERAL

24.10 NUCLEAR REACTION AND SCATTERING MODELS AND METHODS

70508 Coulomb effects in the multichannel K-matrix approach to the theory of nuclear reactions. L.D.Blokhintsev, A.N.Safronov (Sci. Res. Inst. of Nuclear Phys., M.V. Lomonosov Moscow State Univ., Moscow, USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.88-93 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.925-30 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).

A method is considered for taking account of the Coulomb effects within the framework of the multichannel K-matrix approach to the theory of nuclear reactions. The authors give a dispersion-theory treatment of the K-matrix formalism, and on this basis, using the analytic properties of the Coulomb-nuclear amplitudes, they formulate an equation that couples the T- and K-matrices. In the potential scattering problem this equation may be rigorously substantiated, and a nonsingular integral equation may be derived for the K-matrix. The indicated equation may be treated as a generalisation of the well-known Heitler equation (1967) for the case when there is Coulomb interaction between particles. (13 refs.)

70509 Laplace transform method for off-shell scattering on nonlocal potentials. D.K.Ghosh, S.Saha, K.Niyogi, B.Talukdar (Dept. of Phys., Visva-Bharati, West Bengal, India).

Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.5, p.528-39 (1983).

A Laplace transform method is developed to construct off-shell wave functions for scattering on nonlocal potentials. Specific results presented refer to some symmetric and nonsymmetric potentials which have important applications in nuclear scattering reactions. It is pointed out that the merit of the present approach is its simplicity. (12 refs.)

70510 A coupled channel computing code for neutron-nucleus reactions. Yan Bai-ling (Inst. of Atomic Energy, Acad. Sinica, Beijing, China).

Commun. Theor. Phys. (China), vol.1, no.1, p.97-106 (1982).

A method of calculating the coupled channel Schrodinger equations is described and the structure of the computing code is given. (7 refs.)

70511 The non-orthogonality problem of the coupled reaction channels method. E.W.Schmid (Inst. fur Theoretische Phys., Univ. der Tubingen, Tubingen, Germany).

Z. Phys. A (Germany), vol.311, no.1-2, p.67-70 (1983).

The coupled reaction channels method is formulated as a two-step procedure. In the first step, the eigenvalue problem of the overlap operator is solved. In the second step, an off-shell transformation is applied to the coupled reaction channels equation. The transformed equation has an energy-independent interaction. Redundant solutions which arise when the test function space is linearly dependent are removed from the physical part of the spectrum and become positive energy bound states at chosen (unphysical) energies. The non-orthogonality of test functions of different channels is related to the appearance of implicit distortion corrections. (11 refs.)

70512 Solution of the reduced occupation-number equation for a fermion system. Z.Jingshang, G.Wolschin (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).

Z. Phys. A (Germany), vol.311, no.3, p.177-84 (1983).

The relaxation of the single-particle occupation numbers towards the equilibrium limit in a fermion system is studied on the basis of a nonlinear transport equation. The solution is obtained numerically for time-dependent transport coefficients, and compared with the analytical results for constant coefficients. In both cases the time-dependence of the entropy is discussed. (5 refs.)

70513 Multiparticle production in hardon-nucleus and nucleus-nucleus collision. V.Kumar (Dept. of Phys., Univ. of Rajasthan, Jaipur, India).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.7
Successive independent collision and collective collision approaches for understanding the mechanism of multiparticle production have been reviewed in the light of normalized mean multiplicity of created particles (R_3) and its target mass dependence, dispersion to averaged created particle multiplicity relation and dispersion of rapidity of shower particles, etc. The two approaches have also been tested for the single traversal of projectile hadron through target at a given impact. This has been done by using differential shower multiplicity distributions corresponding to grey particle (recoiled protons) bins in the emulsion experiments. The experimental world data of p-A and π^--A reactions does not support either of the two approaches completely. Average multiplicity of charged pions in p-A, π^--A, and nucleus-nucleus collisions shows a polynomial growth with energy available in centre of mass system. (no refs.)

70514 Study of three particle correlation in relativistic heavy ion collision. D.Ghosh (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.9
To obtain information on the mechanism of heavy ion interactions it is important to investigate the correlation effects among the relativistic particles produced. Although there have been some studies on 2-particle correlation no work has yet been reported where an investigation of 'true' three particle correlation of dynamical origin has been done. The author makes a first investigation for the 'true' three particle dynamical correlation among relativistic particles produced in the interaction of O^{16} with nuclei of photoemulsion at 2.1 GeV/n. (1 ref.)

70515 Equilibrium and nonequilibrium sequential emission of light particles in deeply inelastic collision (DIC). A.Strazzeri (Istituto di Fisica, Univ. Dicatania, Catania, Italy).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.34
Simple theoretical expressions are presented for the preequilibrium (PE) and equilibrium (E) parts of the b-c angular correlation for a sequential three-body reaction X(a,b)Y(c)Z under the hypothesis that the nucleus Y is excited to levels that lie within an energy interval Δ centred at ϵ^*. (1 ref.)

70516 Consequences of multiple interactions mechanism for particle production on nuclei in kinematically forbidden region. V.B.Kopeliovich (Inst. for Nuclear Res., Moscow, USSR).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.35
The consequences of multiple interactions mechanism for particle production on nuclei in the region kinematically forbidden for interaction with an isolated nucleon (KFR), or cumulative production, are considered. (no refs.)

70517 The breakup of spectator residues in relativistic nuclear collisions. A.I.Warwick, H.H.Gutbrod, H.G.Ritter, H.Stelzer, F.Weik, H.H.Wieman, S.B.Kaufman, E.P.Steinberg, B.D.Wilkins (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.37
Based on the results of a multi-detector experiment, the authors develop a comprehensive description of the breakup of the excited residue of a Au nucleus after bombardment by relativistic protons, helium and neon projectiles. They have measured the spectra of the slow fragments ($10<A<150$) and the multiplicities of the charged particles emitted from the same event. These multiplicities fall into two categories; the fast, light particles from the primary interaction zone and the slower, heavier charged particles ($2<Z<12$) from the target residue. They separate the contribution of fission to the yield of intermediate mass fragments from a more violent spallation mechanism, which produces fragments across the full range of measured masses. (3 refs.)

70518 Selection of binary and nonbinary heavy ion reactions via particle KX-ray coincidences. H.W.Wilschut, R.K.Bhowmik, P.B.Goldhoorn, J.F.W.Jansen, R.H.Siemssen, K.Siwek-Wilczynska, Z.Sujkowski, J.Wilczynski (Kernfysisch Versneller Inst., Groningen, Netherlands).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.46
The authors have developed a new method for selecting and studying various channels of heavy-ion reactions in strongly asymmetric systems. The method consists of detection of double (particle-KX_1) and triple (particle-KX_1-KX_2) coincidences between fast projectile residues and KX-rays resulting from converted transitions in complementary heavy reaction products. By identifying the ejectile (Z and A) with a standard ΔE-E telescope and the charge of the heavy nucleus one can determine the primary reaction channel, assuming that reactions involving 4 particles in the final state do not contribute significantly. In such a way, the reaction sub-channels (projectile, ejectile XN) which can be identified in the particle-γ coincidence method are integrated in a common yield corresponding to a given $Z_{residue}$. (2 refs.)

70519 Two particle−two hole effects on the mass distributions in deep inelastic heavy ion collisions. M.Tohyama, S.Yamaji (Cyclotron Lab., Inst. of Phys. & Chem. Res., Saitama, Japan).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.49 (3 refs.)

70520 The nuclear response and the imaginary potential for nucleus-nucleus collision. S.C.Phatak (Inst. of Phys., Bhubaneswar, India), B.Sinha.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.60 (2 refs.)

70521 About the unified description of elastic and inelastic cross sections in heavy-ion collisions. A.A.Shirokova, K.V.Shitikova (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.61
The approach permitting a unified description of elastic and inelastic cross section with excitation of a monopole resonance in heavy-ion collisions is proposed and developed. In the K-harmonic method, the densities for the ground and monopole-excited states of nuclei can be obtained in a unified manner and are different solutions for the same equation. (2 refs.)

70522 Methods for the microscopic calculation of the potential overlap in the DWBA description of multiparticle transfer reactions. R.G.Lovas, K.F.Pal (ATOMKI, Debrecen, Hungary), M.A.Nagarajan.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.62
The DWBA amplitude of the A(a,b)B(a=b+x) process involves the potential overlap $\phi(r)=(a!/b!x!)^{1/2}<\Phi_b\Phi_x|V_{b-x}|\Phi_a>$ r, where Φ are antisymmetrized internal wave functions and V_{b-x} is the sum of internucleon forces between b and x. A best means of determining ϕ is from the generator coordinate model (GCM) for a, in which the trial function is schematically $\Psi_a=\int dSS^2f^0(S)\mathcal{A}_{b-x}\{\Psi_b\Psi_x\}_S$+distortion terms, where Ψ_b and Ψ_x, which are c.m. factors times Φ_b and Φ_x respectively, are pinned down at the distance of S from each other, $\mathcal{A}_{b-x}$ is the intercluster antisymmetrizer, and $f^0(S)$ is the GCM amplitude determined by diagonalizing the Hamiltonian. In general, it is difficult to compute ϕ because of its asymmetric form. The authors have elaborated two exact procedures and two approximate methods for evaluating the DWBA amplitude. As a test, they applied them to the non-trivial and realistic example of a ^7Li composed purely of free α and t clusters of equal size represented by harmonic oscillator wave functions. (3 refs.)

24.10H Optical and diffraction models

70523 On the nucleon optical potential in the one-boson exchange model. A.V.Pozdnyakov, L.N.Savushkin, V.T.Ippolitov.
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.38-40 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.874-6 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
The authors construct the entire real part of the optical potential by starting from the NN-interaction in the one-boson exchange model. This potential is then used in calculations of neutron cross sections. (4 refs.)

70524 A phenomenological imaginary part of the optical potential for heavy ions. J.M.Quesada, M.Lozano, G.Madurga (Dept. de Fisica Atomica y Nuclear, Facultad de Fisica, Univ. de Sevilla, Sevilla, Spain).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.14-18 (19 May 1983).
The depth of the imaginary part of the optical potential is derived from the assumption that, at a given energy and for each partial wave L, it is proportional to the compound nucleus density level up to a given excitation energy above the yrast level corresponding to the angular momentum *L*, and remains a constant for smaller values of *L*. The prescription is successfully tested for the system ^{16}O+^{28}Si at nine different projectile energies between 33 and 81 MeV; it fails however at 141.5 MeV, as expected, because other channels, besides elastic scattering and fusion, are important. (18 refs.)

24.30 RESONANCE REACTIONS AND SCATTERING

70525 Spins and parities of the resonance states of ^{24}Mg which are excited in the ^{23}Na(p,α)^{20}Ne and ^{23}Na(p,p$_h$)^{23}Na* reactions for E_p=6.27, 6.37 and 6.52 MeV. S.S.Vasil'ev, M.S.Golovkov, T.N.Mikhaleva, D.L.Chuprunov.
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.104-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.940-3 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
The angular distributions of the particles of the ^{23}Na(p,α)^{20}Ne and ^{23}Na(p,p$_h$)^{23}Na reactions are investigated for the resonance states which arise in ^{24}Mg for E_p=6.27, 6.37 and 6.52 MeV. (6 refs.)

70526 Spreading width of Gamow-Teller resonances in ^{208}Bi. S.Adachi (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.5-8 (19 May 1983).
The spreading width of the Gamow-Teller resonance in ^{208}Bi is studied in the self-consistent TDA with the Skyrme interaction. Coupling between 1p1h states and 2p2h states are included in the TDA linear response function. (10 refs.)

70527 Collisional spreading of small amplitude nuclear vibrations. M.C.Nemes (Hahn-Meitner-Inst. fur Kernforschung, Berlin, Germany), A.F.R.de Toledo Piza.
Z. Phys. A (Germany), vol.310, no.4, p.399-44 (1983).
The authors present a microscopic treatment of the spreading widths of giant resonances—a collisional RPA (with complex frequencies, $z=i\omega+\gamma$) which turns out to have a very simple analytical form. It includes the usual mean field contribution, which reproduces the frequencies of the collisionless RPA, and also non-unitary (collision) contributions which arise from the inclusion of quantum correlation effects in the weak coupling approximation. This collisional RPA equation can be easily put to quantitative use in realistic nuclear structure problems. (7 refs.)

70528 Statistical properties of 3/2$^+$ resonances in ^{49}V. P.Ramakrishnan, B.H.Chou, G.E.Mitchell (North Carolina State Univ., Raleigh, NC, USA), E.G.Bilpuch, R.O.Nelson, J.F.Shriner,Jr., C.R.Westerfeldt.
Z. Phys. A (Germany), vol.311, no.3, p.157-62 (1983).
Amplitude and width correlations were determined for three decay channels for 30 3/2$^+$ resonances in ^{49}V. Singles and coincidence measurements were employed in this first determination of relative signs of decay amplitudes for 3/2$^+$ resonances. Very large amplitude and width correlations are observed. (16 refs.)

70529 Microscopic study of ^{16}O+^{15}N. S.Okabe (Dept. of Phys., Hokkaido Univ., Sapporo, Japan).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.72
In systems composed of two nearly identical nuclei scattering and reaction phenomena have been analysed by some models of nucleus-nucleus interactions with parity dependence. In order to study the parity dependence which originates in the total anti-symmetrization the author treats an ^{16}O+^{15}N system as a typical example in a framework of the RGM-GCM equation with the M3Y effective nucleon-nucleon potential (Reid even and Eliott odd central, Reid spin-orbit). 24.50 DIRECT REACTIONS

70530 Investigation of the mechanism of the (^{3}He,α) reaction of the ^{13}C nucleus. G.S.Gurevich, V.M.Lebedev, N.V.Orlova, A.V.Spasskii, I.B.Teplov, L.N.Fateeva, L.Mestre (Sci. Res. Inst. of Nuclear Phys., M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.59-63 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.897-902 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
Investigates the mechanism of the ^{13}C(^{3}He,α)^{12}C reaction with the production of a final nucleus in the first excited state. ^{3}He particles of energies 18 and 23 MeV were used. Based on the results of comparing the shape of the experimental angular distributions with the theoretical distributions, the authors concluded that the principal reaction mechanism is the nucleon-pickup mechanism. (14 refs.)

70531 On the polarisation and interference phenomena in the process of electrospallation of a deuteron. D.Ishankuliev, B.K.Kerimov, A.A.Sokolov (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.97-103 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.934-9 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
The spallation of a deuteron by longitudinally polarised electrons $e^-_{L,R}+d\rightarrow n+p+e^-$ is considered in the momentum approximation with allowance for the polarisation of the produced proton. The differential cross section of the process is calculated with simultaneous allowance of the electromagnetic interaction and the WNC interaction. Calculations of the P-odd effects are carried out within the framework of four gauge models which are based on the groups SU(2)$\otimes$U(1) and SU(3)$\otimes$U(1). (10 refs.)

24.60 STATISTICAL THEORY AND FLUCTUATIONS

70532 Density of bound and unbound exciton states in the microscopic model of preequilibrium nuclear reactions. F.A.Zhivopistsev, E.I.Kebin, V.G.Sukharevskii, V.A.Khaimin (Sci. Res. Inst. of Nuclear Phys., M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.48-53 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.885-91 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981). (11 refs.)

70533 Two-component exciton model. J.Dobes (Inst. of Nuclear Phys., Czechoslovak Acad. of Sci., Rez, Czechoslovakia), E.Betak.
Z. Phys. A (Germany), vol.310, no.4, p.329-38 (1983).
The exciton model of nuclear reactions with the distinguishabilty of protons and neutrons explicitly included is discussed. The Pauli master equation and transition rates in this two-component formulation are given. Both the simple considerations and actual calculations show that the two-component model exhibits new features and modifies conclusions of the one-component formulation. The ratio of the proton to neutron preequilibrium emissions in proton induced reactions decreases twice to three times when compared with the usual one-component model. (25 refs.)

70534 The nuclear response time in precompound reactions. M.Kawai, H.A.Weidenmuller (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
Z. Phys. A (Germany), vol.311, no.1-2, p.117-18 (1983).
Using an improved estimate based on a quantal expression for the nuclear response time the authors show that in the phenomenological models for precompound reactions, the condition for the validity of the Markov approximation is nearly satisfied. (8 refs.)

70535 Statistical approach to composite particle emission. W.A.Friedman, W.G.Lynch (Michigan State Univ., East Lansing, MI, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.22
Considerable attention has recently been directed to the relative multiplicities of various fragments produced in energetic nuclear reactions in the belief that these will provide evidence regarding the underlying thermodynamics of the reactions. Indeed, it has been suggested that the apparent power-law behavior observed in the dependence of multiplicity on fragment mass, A_F, is a signature for a liquid-gas nuclear phase transition. The authors have calculated the time evolution of an ensemble-averaged excited system which undergoes statistical emission. They easily include nucleon fragments with A_F up to 20 by using the phase space considerations of the Hauser-Feshbach theory. The calculations, which include isospin effects, Coulomb barriers and emitter recoil, follow these and other related quantities as the excited system cools. They obtain the time integrated multiplicities and spectra for each of the emitted fragments. (3 refs.)

70536 On the description of multiplicity distributions in multiple production processes in terms of combinants. J.Bartke (Lab. of High Energies, JINR, Dubna, USSR).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.28
Multiplicity distributions of secondary particles produced in high energy reactions are usually described in terms of their statistical moments or other parameters closely related to the moments (average multiplicity, dispersion,

skewness, etc.). It has been proposed to analyze multiplicity distributions in terms of another set of probability coefficients related to probability ratios P(m)/P(n). These coefficients are denoted C(k), and called 'combinants'. The author applies the combinants for the description of the experimental multiplicity distributions of negative secondaries produced in interactions of high energy hadrons and nuclei. (7 refs.)

70537 On some characteristics of the multiplicity distributions of shower particles originating from proton-emulsion interactions below 20 GeV. M.Sumbera, S.Vokal (Lab. of High Energies, JINR, Dubna, USSR).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.29
The authors report on the properties of n_s-distributions obtained from p+Em interactions at $E_0 \leq 20$ GeV. They show that for this region of primary energies approximate KNO-scaling holds. The best fit is obtained with the Buras parametrization. (2 refs.)

70538 The effects of composite particle formation in the (A,B) and (A,Bγ) pre-equilibrium reactions. V.G.Sukharevsky, F.A.Zivopistsev (Inst. of Nuclear Phys., Moscow Univ., Moscow, USSR).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.36
The mechanisms of emission of composite particles ($A \leq 4$) have been analysed in the framework of the quantum-field model of pre-equilibrium reactions. The intermediate states (IS) are classified by the number of quasiparticles, the effective interactions between them being different from the interaction of free particles. The reaction results in free composite particles B. The factors of transition of quasi-particles $\langle \gamma_B \uparrow \rangle$ to a free composite particle in the outlet channel are determined. All possible emission mechanisms (direct knock-out, stripping or pick-up, coalescence) are taken into account in $\langle \gamma_B \uparrow \rangle$. The determination of $\langle \gamma_B \uparrow \rangle$ permits one to obtain the absolute cross-section value without employing the fitting parameters. The model analysis of the γ-quantum emission spectrum for the (A,Bγ) reactions have been made. The analysis shows that the smooth γ-quantum energy spectrum is determined by annihilation of the quasi-particle−quasi-hole pair and by the quasi-particle or quasi-hole γ-emission. The radiation transitions accompanying the formation of a composite particle determine the characteristic γ-quantum spectrum depending on the type of many-stage formation mechanism of a composite particle. This is, mainly, due to relaxation through the IS of the continuum. In this process the formation probability of a group of nucleons with parallel momenta is high, which determines a large yield of composite particles. (2 refs.)

24.70 POLARIZATION IN REACTIONS AND SCATTERING

70539 Spin-spin correlations and spin-asymmetries for the reaction $\vec{p}\vec{p} \to pn\pi^+$ at 510 MeV. R.Shypit, C.E.Waltham, D.A.Axen, F.Entezami (Phys. Dept., Univ. of British Columbia, Vancouver, BC, Canada), M.Comyn, D.Healey, G.A.Ludgate, G.D.Wait, D.V.Bugg, J.A.Edgington, N.R.Stevenson.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.314-16 (5 May 1983).
Spin-spin correlation parameters A_{LL}, A_{NN}, A_{SS} and spin-asymmetries A_B and A_T have been measured for the reaction $\vec{p}\vec{p} \to pn\pi^+$ with an incident beam energy of 510 MeV. Clean separation of free-proton events from the carbon background has been achieved. Results agree well with the predictions of Dubach, Kloet and Silbar (1982). (12 refs.)

70540 Structure of the mass operator in finite Fermi systems. V.I.Belyak, G.M.Vagradov (Inst. of Nuclear Res., Acad. of Sci., USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.899-906 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.431-42 (Sept. 1982). [received: May 1983]
The field methods of many-body theory are used to consider the structure of the mass operator in finite Fermi systems. It is shown to have a pole dependence on the energy. Various approximate methods of determining it are discussed. The general properties of the quasiparticle spectrum are investigated on the basis of the obtained form of the mass operator. (6 refs.)

70541 Gamma-ray polarization and nuclear orientation measurements on ^{182}TaFe. J.Rikovska, D.Novakova (Dept. of Phys., Czechoslovak Tech. Univ., Prague, Czechoslovakia), J.Ferencei, M.Finger.
Z. Phys. A (Germany), vol.311, no.3, p.185-93 (1983).
The results of combined measurements of the directional distribution and the linear polarization of gamma-rays from oriented ^{182}TaFe are reported. Construction and calibration of a Compton polarimeter based on a single planar Ge(Li) detector are described. The degree of the linear polarization and multipole mixing ratios for many gamma-transitions in ^{182}W have been deduced. A triple multipole mixing $E1+M2+E3$ of the 1274 keV transition has been obtained with $_1(M2/E1)=+0.36(10)$ and $\delta_2(E3/E1)=-0.28(12)$. Results are discussed in the framework of the rotational model. Strong evidence of the octupole vibrational nature of the 1289 keV level in ^{182}W has been found. (30 refs.)

70542 Measurement of the polarization parameter P in π^+p elastic scattering in the region of low-lying pion-nucleon resonances. Inst., Acad. of Sci., Leningrad, USSR).
Z. Phys. A (Germany), vol.311, no.3, p.217-23 (1983).
Presents the results of an experiment in which the polarization parameter P in π^+p elastic scattering has been measured in the energy range from 335 to 580 MeV. The experiment was performed on a pion channel of the LNPI synchrocyclotron using a polarized proton target and wire spark chambers with magnetostrictive read-out. The results have substantially higher precision in comparison with most of the other experiments in this energy range and allow to determine unambiguously the shape of angular dependence $P(\theta^*)$ in the whole investigated region. New phase-shift analysis of π^+p scattering data has been performed. The results of this experiment were used also to check isospin invariance. (23 refs.)

25.20 PHOTONUCLEAR REACTIONS AND PHOTON SCATTERING

70543 The ^{3}He(γ,2*p*)*n* reaction for E_γ=80-170 MeV. C.A.Peridier, J.L.Matthews, M.J.Leitch (Dept. of Phys., MIT, Cambridge, MA, USA), H.Jeremie, M.Irshad, B.L.Roberts.
Z. Phys. A (Germany), vol.310, no.4, p.317-28 (1983).
The cross section for the ^{3}He(γ,2*p*) reaction has been measured in a complete kinematics experiment in the energy range E_γ=80-170 MeV, for $\theta_{p1}=\theta_{p2}=90°$. This configuration was selected in order to investigate the role of proton-proton final state interactions in the three-body breakup process. The measured proton spectra are seen to be consistent with a prediction using the Watson-Migdal formalism. The magnitude of the observed cross section clearly indicates an enhancement over phase space, presumably due to the strong proton-proton interaction in the final state. The experimental results agree, within their limited statistical accuracy, with a theoretical calculation which includes this effect. (35 refs.)

25.30 LEPTON-INDUCED REACTIONS AND SCATTERING

70544 The theory of electron-scattering coincidence experiments. W.E.Kleppinger, J.D.Walecka (Dept. of Phys., Stanford Univ., Stanford, CA, USA).
Ann. Phys. (USA), vol.146, no.2, p.349-94 (1 April 1983).
A general expression for the electron-scattering coincidence cross section for the reaction $A_1(e,e'X)A_2$ with a nuclear target is derived in the one-photon exchange approximation. Tables of angular correlation coefficients are given for the case where the initial nucleus A_1 has $J_1^\pi=0^+$. Connection is made in the 'static limit', and with the assumption that the reaction proceeds through

a finite number of Breit-Wigner resonances with a corresponding factorisation of the electroproduction transition matrix elements, to the familiar electromagnetic transition multipole moments involving excitation of a nuclear state J^π. Analytic expressions for the coincidence cross sections are given for spin-zero systems and some very simple, basic models of nuclear 'giant resonance' excitations. Finally, a reanalysis of the recent Stanford data of Calarco et al. (1980) on $^{12}C(e,e'p_0)\ ^{11}B(3/2^-)$ in the vicinity of the giant dipole resonance in ^{12}C is carried out using a very simple nuclear model but retaining all the terms in the coincidence cross section, some of which were previously neglected. (26 refs.)

70545 Electron scattering from ^{13}C. Il.Tong Cheon (Internat. Centre for Theoretical Phys., Trieste, Italy).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.451-7 (12 May 1983).
Transverse form factors for elastic and inelastic electron scattering from ^{13}C have been calculated with the Cohen-Kurath wave functions, by introducing an alteration into the nucleon form factor in nuclei. The results show good agreement with the data. The author has concluded that the Cohen-Kurath wave function can reproduce the experimental results of photopion production and electron scattering from ^{13}C in the momentum transfer, $q \lesssim 2\ \mathrm{fm}^{-1}$. 25.40 NUCLEON-INDUCED REACTIONS AND SCATTERING

(see also 28.20 Neutron physics)

70546 Calculation of the cross section of the $^6Li(n,nd)^4He$ reaction with the cluster wave functions of the ^6Li nucleus. L.M.Lazarev.
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.76-82 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.914-20 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
A brief exposition is given of the formalism of a semi-microscopic method, and then this method is demonstrated using the example of the problem of the scattering of three bosons, the interaction between which, is described by point pair potentials. The result of calculating the cross section of the (n,nd) reaction on the ^6Li nucleus using the cluster wave functions of the target nucleus as the basis functions, is also presented. (12 refs.)

70547 Estimate of the error of solving the integral equation with the local potential for scattering of a nucleon by a deuteron. E.I.Dubovoi, Z.F.Kertkoev, V.P.Yakovlev (Radioengng. Inst., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.94-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.931-3 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
In a previous work (Dubovoi et al., 1982) it was demonstrated that a fundamental constraint exists on the accuracy of solving the system of integral equations of the three-nucleon scattering problem. It is due on the one hand to errors in determining the phase shifts of nucleon-nucleon scattering—to the necessity of discarding the high phases, and on the other hand to the necessity of increasing the dimensionality of the numerical matrix of the system of algebraic equations corresponding to the integral equations. In using a nonlocal separable potential one can describe the data on the cross section and polarisation with an error of not less than 10 to 30% when the s-, p- and d-waves are taken into account. The authors consider the solution of this same problem with a local potential. (14 refs.)

70548 Optimization of irradiation parameters for ^{67}Ga production from $^{nat}Zn(p,xn)$ nuclear reactions. M.Bonardi, C.Birattari (Istituto Sci. Fisiche, Univ. of Milan, Milano, Italy).
J. Radioanal. Chem. (Switzerland), vol.76, no.2, p.311-18 (1983).
Excitation functions for $^{nat}Zn(p,xn)$ and (p,pxn) nuclear reactions in the 5-45 MeV proton energy range were measured. Evaluations were made both of target thickness and proton energy in order to optimize the ^{67}Ga production rate, at the same time minimizing contamination by ^{66}Ga. Optimal irradiation conditions, depending both on the beam current available and on the power dissipated into the target were determined. (16 refs.)

70549 Impulse-approximation Dirac optical potential. J.A.McNeil (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA), J.R.Shepard, S.J.Wallace.
Phys. Rev. Lett. (USA), vol.50, no.19, p.1439-42 (9 May 1983).
The impulse approximation to the Dirac optical potential for proton-nucleus elastic scattering is deduced from elementary considerations and found to be in remarkably good agreement with phenomenological parameters. The large difference between the real parts of scalar and vector optical potentials is explained by the impulse approximation. (14 refs.)

70550 Relativistic impulse approximation for *p*-nucleus elastic scattering. J.R.Shepard (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA), J.A.McNeil, S.J.Wallace.
Phys. Rev. Lett. (USA), vol.50, no.19, p.1443-6 (9 May 1983).
First calculations based on an impulse-approximation Dirac optical potential are presented. All input parameters are constrained by other experimentally determined quantities. Excellent agreement with $T_p = 500$ MeV $p_{pol} + {}^{16}O$ and ^{40}Ca elastic scattering data is demonstrated. The differences between the relativistic and nonrelativistic results are explored in detail. (21 refs.)

70551 The proton-deuteron scattering lengths. J.L.Friar, B.F.Gibson (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), G.L.Payne.
Phys. Lett. B (Netherlands), vol.124B, no.5, p.287-92 (5 May 1983).
Proton-deuteron quartet and doublet scattering lengths resulting from configuration-space Faddeev calculations are reported. The values of $^4a_{pd} \approx 14$ fm and $^2a_{pd} \approx 0.1$ fm differ substantially from the accepted experimental values and from theoretical estimates using approximate methods to include Coulomb effects. An explanation of the results in terms of the two-body strong-plus-Coulomb potential is provided. (17 refs.)

70552 Polarization in inclusive scattering of protons from nuclei at 1 GeV. S.L.Belostotsky, Yu.V.Dotsenko, J.Ero, Z.Fodor, L.G.Kudin, N.P.Kuropatkin, A.A.Lobodenko, O.V.Mikluho, V.N.Nikulin, O.E.Prokof'ev, Z.Seres, E.N.Volnin, A.A.Vorobyov (Leningrad Nuclear Phys. Inst., Gatchina, USSR).
Phys. Lett. B (Netherlands), vol.124B, no.6, p.469-70 (12 May 1983).
The authors have measured the polarization of protons produced in inclusive proton-nucleus reaction $p+A \to p+X$ at 1 GeV. Measurements have been done using a double scattering technique with a magnetic quadrupole spectrometer and a proportional chamber polarimeter. The polarization of backward protons is found to be close to zero. (9 refs.)

70553 Carbon and deuterium nuclear scattering of 48.5 MeV protons. V.I.Grantsev, V.I.Konfederatenko, V.A.Kornilov, O.F.Nemets, R.G.Ofengenden, B.A.Rudenko, M.V.Sokolov, B.G.Struzhko.
Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.506-11 (April 1983). In Russian.
Differential cross-sections of elastic 48.5 MeV proton scattering by ^{12}C, hydrogen and deuterium nuclei were measured. The experimental results are compared with values obtained from a numerical solution of Faddeev integral equations with *S*-wave separable Yamaguchi potentials and charge-dependent forces. (22 refs.)

70554 Catastrophic destruction of heavy emulsion nuclei induced by fast hadrons. M.El-Nadi, A.T.Baranik, A.El-Naghy, N.Mettwalli, O.E.Badawy, S.Akbd El-Halim (Phys. Dept., Faculty of Sci., Cairo Univ., Cairo, Egypt).
Z. Phys. A (Germany), vol.310, no.4, p.301-6 (1983).
Photoemulsions were irradiated to 8.4, 9.6, (69 GeV/c) protons and 4.2 GeV/c/nucleon ^{12}C ions. Large stars, having a number of heavily ionizing particles $n_h \geq 28$, were selected for this study. These events represent the catastrophic destruction of AgBr emulsion nuclei. Multiplicity, angular and energy distributions of particles, produced in this case, were studied at different momenta and for different incident particles. It was shown that the products of complete destruction of heavy nuclei are nearly individual nucleons. The probability of this phenomenon increases with the projectile mass number. About half of nuclear matter is knocked out of the target nucleus with energy higher than 30 MeV/nucleon. The average multiplicity of *s*-particles $\bar{n}_s$ is weakly dependent on the target nucleus mass number whereas the average multiplicity of *g*-particles $\bar{n}_g$ is strongly dependent on it. The modified pre-equilibrium model gives a satisfactory description for the energy spectrum of the emitted slow protons. (26 refs.)

70555 Elastic backscattering cross sections of protons on oxygen. M.Braun, T.Fried (Res. Inst. of Phys., Stockholm, Sweden).
Z. Phys. A (Germany), vol.311, no.3, p.173-5 (1983).
Absolute values of elastic scattering cross sections of protons in the energy region 600-2000 keV have been measured on oxygen for scattering angles between 110 and 160°. The method applied in the present work is advantageous in regard to determine absolute cross sections, since quantities such as proton particle fluence and detection geometry can be neglected. The results show that the measured cross sections are considerably higher than Rutherford cross sections for proton energies close to 2000 keV. No resonances are observed in the energy region studied. (5 refs.)

25.50 ^{2}H- AND ^{3}H-INDUCED REACTIONS AND SCATTERING

70556 **On the spin-dependence of transfer channel coupling in sub-coulomb deuteron scattering.** J.A.Tostevin, R.C.Johnson (Dept. of Phys., Univ. of Surrey, Guildford, England).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.135-8 (28 April 1983).
It is shown that, for sub-Coulomb incident deuteron energies, coupling to weakly bound neutron transfer channels produces large changes in the calculated elastic channel vector analysing powers, iT_{11} as compared with those obtained using a folding model spin-orbit interaction. Coupled channels calculations for deuteron scattering from ^{208}Pb at 8 MeV and 9 MeV are in quantitative agreement with the experimental iT_{11} data. (15 refs.)

Neutral strange particles and π^0 production in the collisions of d and ^{12}C with Ta at 4.2 GeV/c/N momentum ....See Entry 70583

25.60 ^{3}HE- AND ^{4}HE-INDUCED REACTIONS AND SCATTERING

70557 **Elastic scattering of high energy alpha-particles on nuclei.** A.N.Antonov, V.A.Nikolaev, I.Zh.Petkov (Inst. for Nuclear Res. & Nuclear Energy, Acad. of Sci., Sofia, Bulgaria).
Bulg. J. Phys. (Bulgaria), vol.10, no.1, p.42-9 (1983).
The experimental data of elastic alpha-particle (1.37 GeV) scattering on ^{12}C and ^{40,42,44,48}Ca are successfully analysed in the framework of the model of coherent fluctuations of nuclear density. The values of the parameters (effective radius and surface thickness of the target nucleus) which appear in this approach are discussed. (18 refs.)

70558 ***D*-state and multistep effects in (α,*d*) reactions.** J.R.Comfort (Phys. Dept., Arizona State Univ., Tempe, AZ, USA), W.W.Daehnick.
Phys. Rev. Lett. (USA), vol.50, no.20, p.1627 (16 May 1983).
Nagarajan and Satchler (1982) have attributed an observed sawtooth pattern in the integrated cross sections of the reaction ^{208}Pb(α,*d*) to states of the $h_{9/2}g_{9/2}$ multiplet in ^{210}Bi as arising from the relative *D*-state motion of two deuterons in the α particle. They predict that natural-parity transitions will be suppressed and unnatural-parity transitions enhanced with respect to one-step distorted-wave Born-approximation (DWBA) cross sections. The authors argue that the *D*-state modifications of one-step cross sections are contrary to the experimental patterns for multiplets whose J_{max} states have unnatural parity. (5 refs.)

70559 **Some problems in the microscopic theory for the interaction of complex nuclei.** Wu Guanghan, Yang Dailun (Inst. of Nuclear Sci. & Tech., Sichuan Univ., Chengdu, China).
Sci. Sin. (China), vol.26, no.4, p.390-401 (April 1983).
A new generating function is presented to solve the problem of the CM spurious state in unequal clusters. The Canto-Brink (1977) and Mito-Kamimura (1976) variational methods are derived from the stability principle and the results of the double Fourier transformation are deduced in a simple way. A general program is set up to derive analytically the GCM and RGM kernels, and the *a-a*, *a-He*^{3} and *a-t* elastic scattering phase shift is calculated. (19 refs.)

70560 **Interaction of relativistic alpha particles in emulsion at 2.1 GeV/c/nucleon.** O.E.Badawy, M.El-Nadi, S.A.El-Sharkawy, M.K.Hegab, M.M.Sherif (Phys. Dept., Cairo Univ., Giza, Egypt).
Z. Phys. A (Germany), vol.311, no.1-2, p.105-12 (1983).
An analysis for 2000 events produced by 2.1 GeV/c/N alpha particles in nuclear emulsion has been carried out. Multiplicity and angular distributions of charged secondaries have been measured and correlations among them are discussed. The presented data are compared with relevant values from proton and ^{14}N interactions with nuclei. The multiplicity distribution of showers has been tested by a modified independent nucleon-nucleus multiple scattering model (El-Sharkawy, 1980) and the model Gasparyan et al. (1979). (16 refs.)

70561 **Light ion induced Hanbury-Brown Twiss proton correlations near the Fermi energy.** R.A.Cecil, S.T.Thornton, R.L.Parks (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA), G.R.Young, T.C.Awes, T.N.Tad-deucci.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.14
The authors report initial results from a study of the Hanbury-Brown Twiss (HBT) small relative momentum proton-proton correlations from a 146 MeV alpha beam incident on a ^{60}Ni target. (3 refs.)

70562 **Pre-equilibrium and knock-out processes in (α,2α) reactions.** H.Machner (Univ. of Bremen, Bremen, Germany), U.Bechstedt, A.Budzanowski, P.Jahn, C.Mayer-Boricke.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.19
The authors study the ^{58}Ni(α,α'c) reactions at E_α=140 MeV. The charged particles c have been detected in the reaction plane given by the beam and inelastically scattered α'-particles by $\theta_{\alpha'}=-30°$. The coincident particles detected were mainly protons and a few α-particles. The cross sections have been transformed into the rest system of the recoiling nucleus. The integrated α'-yield shows a strong assymmetry while the integrated p-yield seems more or less isotropic. This may have its origin in relatively strong contributions from quasifree (α,2α) reactions. They assume that the incoming α-particle interacts quasifree with a target nucleon transferring energy and linear momentum. This nucleon induced reaction should represent the cross section except the knockout of an α-particle. They compare the α-particle spectrum under $\theta_c=30°$ with inclusive (p,α) data corrected for the recoil direction. (5 refs.)

70563 **Measurement of cross-sections and analysing powers for the break-up of polarised ^{3}He.** N.E.Sanderson, P.V.Drumm, J.B.A.England, J.M.Nelson, J.M.Barnwell, O.Karban (Phys. Dept., Univ. of Birmingham, Birmingham, England).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.40
The study of the break-up of composite particles has received increasing attention in recent years. For light ions (A≤4) microscopic calculations are now being undertaken with a good degree of success. A full understanding of the break-up reactions in these light systems is an important step towards unravelling the mechanisms which develop in heavy ion reactions at higher energies. In order to provide yet more stringent tests of these and other models measurements have been performed, for the first time, of break-up using polarised ^{3}He projectiles. As in the analysis of two-body reactions, study of polarisation effects are expected to be very sensitive to assumptions about the reaction mechanism. The experiments were carried out using the 33 MeV polarised ^{3}He beam at the University of Birmingham cyclotron. Four counter telescopes were used to record both the inclusive and coincidence spectra over a wide range of angle combinations. The d-p coincidence spectra show events mainly corresponding to the quasi-elastic break-up of ^{3}He. The angular correlations and the corresponding analysing power for the elastic break-up on a ^{12}C target are shown. The analysing power, which relates to the difference in the break-up yield for spin-up and spin-down projectiles, is large particularly for wider separation angles between the coincident particles. Measurements on other targets show a large analysing power also for ^{27}Al, but much smaller for ^{58}Ni. (2 refs.)

25.70 HEAVY ION INDUCED REACTIONS AND SCATTERING

70564 **Formation of the mass and angular distributions of the products of reactions with heavy ions.** P.A.Cherdantsev (Tomsk Polytech. Inst., Tomsk, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.67-70 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.906-9 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981). (5 refs.)

70565 **The influence of the zero-point oscillation on the charge transfer in the heavy-ion deep-inelastic collisions.** Ge Lin-xiao, Shen Wen-qing, Yu Chao-fan (Inst. of Modern Phys., Acad. Sinica, Lanzhou, China).
Chin. Phys. (USA), vol.3, no.1, p.101-6 (Jan.-March 1983). [received: May 1983]
The authors discuss the variance of the charge distribution in the heavy-ion deep-inelastic collision on the basis of the Langevin equation. In order to explain the difference of the initial slope (early stage) of the charge distribution for the different reaction systems and different bombarding energies, an initial condition of the charge drift in the early stage of DIC is introduced. It is given by the harmonic or inharmonic motion around the zero point and depends closely on the nuclear structure and incident energy. The difference of the inertial mass and stiffness parameter may be one of the reasons for the difference of charge transfer. In addition, they also analyze the characteristics of the inertial mass parameter. (9 refs.)

70566 **Noncompound light particle emission in nucleus-nucleus collisions.** C.K.Gelbke (Dept. of Phys., Michigan State Univ., East Lansing, MI, USA).
Comments Nucl. & Part. Phys. (GB), vol.11, no.6, p.259-76 (1983).
Present experimental results of noncompound light particle emission are consistent with the concept of statistical equilibrium for a subset of nucleons. By studying the energy dependence of composite light particle emission, one may eventually obtain information about the transition between the liquid and gas phases of nuclear matter. (20 refs.)

70567 **Thermodynamics of phase transition expected in HI collision at high energy.** A.Hasegawa (Dept. of Phys., Saga Univ., Saga, Japan), H.Tanaka.
Prog. Theor. Phys. (Japan), vol.69, no.2, p.685-8 (Feb. 1983).
The fireball model, which has a quark-gluon phase and a hadron phase, is proposed. Assuming a local thermal equilibrium for the fireball, the time and spatial behaviour of the two phases is investigated through a change in the local temperature $T(r,t)$ obtained by solving the relativistic non-linear diffusion equation. (9 refs.)

70568 **Mass spectrum of dilepton produced in relativistic heavy ion collision.** A.Hasegawa (Dept. of Phys., Saga Univ., Saga, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.689-92 (Feb. 1983).
The mass spectrum of dilepton emitted from the fireball born in HI central collisions is calculated. The fireball is assumed to consist of the quark-gluon phase and the pion phase. The mass spectrum at larger mass region is contributed mainly from the quark-gluon phase and the contribution from two phases can be distinguished experimentally. (4 refs.)

70569 **Light fragment emission in the model of transport theory for high-energy nucleus-nucleus collisions.** R.Malfliet (Kernfysisch Versneller Inst., Groningen, Netherlands), E.Martschew, B.Schurmann.
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.152-6 (28 April 1983).
The authors use the model of transport theory to calculate the nucleon distributions in the initial stage of the high-energy nucleus-nucleus collision. They assume composite particle formation to occur during the expansion phase of the initial hot zone, and they calculate the particle final inclusive spectra by using the concepts of equilibrium thermodynamics. The non-equilibrium features of the number and momentum distributions of the primordial nucleons are essential for the good agreement with the inclusive spectra measured in the reaction Ar on KCl at 800 MeV per nucleon. (16 refs.)

70570 **The coalescence phenomenon and the Pauli quenching in high-energy heavy ion collisions.** H.Schulz (Central Inst. for Nuclear Res., Rossendorf, Germany), G.Ropke, K.K.Gudima, V.D.Toneev.
Phys. Lett. B (Netherlands), vol.124B, no.6, p.458-60 (12 May 1983).
Calculating the proton and deuteron spectra of high-energy heavy ion reactions by means of the cascade model it is argued that the effective account of the nuclear medium on the deuteron-like bound-state wave function requires a smaller coalescence radius of the respective momentum sphere compared with that obtained by using a deuteron wave function of two isolated nucleons. (12 refs.)

70571 Maximum-entropy analysis of heavy-ion transfer reactions and the exciton model. R.D.Levine (Fritz Haber Molecular Dynamics Res. Center, Hebrew Univ., Jerusalem, Israel).

Phys. Lett. B (Netherlands), vol.124B, no.6, p.461-4 (12 May 1983).

The author clarifies the concept of the prior distribution with special reference to the exciton model and apply it to energy disposal in heavy-ion transfer reactions. (14 refs.)

70572 Single nucleon transfer reactions in a core excitation model for ^{48}Ti incident on ^{42}Ca at 8 MeV/amu. C.Brendel, J.Carter, F.Beck, A.Richter, G.Schrieder (Inst. fur Kernphys., Tech. Hochschule, Darmstadt, Germany), D.Schull, G.Delic, R.H.Lemmer.

Phys. Lett. B (Netherlands), vol.124B, no.6, p.474-8 (12 May 1983).

Single neutron and proton quasi-elastic transfer in both directions have been studied in collisions of ^{48}Ti onto ^{42}Ca at $E_{\mathrm{Lab}}=385$ MeV. The main strength in the particle energy spectra lies below 12 MeV excitation energy and displays features specific to the reaction channel. A one-step direct transfer mechanisms which includes core excitation describes the main features of the spectra. (13 refs.)

70573 On the suppression of multiple rotational excitation in heavy ion inelastic scattering above the Coulomb barrier. A.J.Baltz, P.D.Bond (Brookhaven Nat. Lab., Upton, NY, USA).

Phys. Lett. B (Netherlands), vol.125B, no.1, p.25-9 (19 May 1983).

Quantum mechanical calculations of ^{134}Xe+^{152}Sm inelastic scattering indicate that heavy ion induced excitation of high spin rotational states should be strongly suppressed at bombarding energies above the Coulomb barrier. The several mechanisms contributing to this effect are discussed. (7 refs.)

70574 Molecular resonances and spin alignment in ^{12}C+^{16}O inelastic scattering. T.Tazawa (Tech. Coll., Yamaguchi Univ., Tokiwadai, Ube, Japan), J.Y.Park, Y.Abe.

Phys. Lett. B (Netherlands), vol.125B, no.1, p.30-4 (19 May 1983).

Recent data on spin alignment of the 3^- state (6.13 MeV) of ^{16}O are analysed from molecular viewpoints in the coupled channel approach. The dominance of the aligned configuration on resonances around 20 and 22 MeV is well explained in the framework of the band crossing model. (20 refs.)

70575 Shadowing of α-emitting fragments observed in 313 MeV ^{32}S+^{93}Nb collisions. G.-Y.Fan, H.Ho, P.L.Gonthier, W.Kuhn, A.Pfoh, L.Schad, R.Wolski, J.P.Wurm (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany), J.C.Adloff, D.Disdier, V.Rauch, F.Scheibling.

Z. Phys. A (Germany), vol.310, no.4, p.269-73 (1983).

Energy and angular correlations of α particles in coincidence with deeply inelastic fragments from ^{32}S+^{93}Nb reactions at 313 MeV were measured and the assumption of sequential α emission from the fragments tested. In the direction of the detected light fragment too few α particles from the heavy fragment are observed. This pronounced anomaly is ascribed to nuclear shadowing of the α particles by the proximate light fragment. (6 refs.)

70576 Moments of charge distributions in the reaction ^{92}Mo+^{92}Mo at 14.7 MeV/u. S.Gralla, Dai Guang-xi, A.Gobbi, K.D.Hildenbrand, W.F.J.Muller, A.Olmi, M.Petrovici, H.Stelzer, J.Toke, H.J.Wollersheim, R.Bock (Gesellschaft fur Schwerionenforschung, Darmstadt, Germany), U.Lynen.

Z. Phys. A (Germany), vol.310, no.4, p.345-6 (1983).

First and second moments of primary charge distributions were determined as a function of the total kinetic energy loss in the reaction ^{92}Mo+^{92}Mo at an incident energy of 14.7 MeV/u. Up to energy losses of 200 MeV no significant drift of the first moments is observed. The second moments are in agreement with predictions of a stochastic model derived at lower bombarding energies. (6 refs.)

70577 Coulomb nuclear interference effects in the elastic and inelastic scattering of ^{16}O and ^{18}O ions on ^{70}Ge. C.D.Uhlhorn, B.Gonsior (Inst. fur Experimentalphys., Ruhr-Univ. Bochum, Bochum, Germany), D.Wegner, K.P.Lieb, H.H.Wolter, A.M.Kleinfeld.

Z. Phys. A (Germany), vol.311, no.1-2, p.79-87 (1983).

Excitation functions of the elastic and inelastic scattering cross sections of ^{16}O and ^{18}O nuclei on ^{70}Ge have been measured at angles between 45° and 175° and at beam energies from 31.5 to 57 MeV. A DWBA analysis has been performed in which the composite structure of ^{18}O has been taken into account according to the approach developed by Landowne and Wolter (1979). Starting from an optical model potential determined from the elastic scattering data in the ^{16}O+^{70}Ge channel, a consistent description of the ^{16}O+^{70}Ge $(2^+, 3^-)$ target excitation, the ^{18}O+^{70}Ge elastic scattering and ^{18}O(2^+)+^{70}Ge projectile excitation cross sections near the Coulomb barrier has been obtained. (21 refs.)

70578 Products of $3\leq Z\leq 9$ from long-lived intermediates in the reactions 336 MeV ^{40}Ar+Ag, ^{154}Sm and Au. L.C.Vaz (Dept. of Chem., State Univ. of New York, Stony Brook, NY, USA), D.Logan, J.M.Alexander, E.Duek, D.Guerreau, L.Kowalski, M.F.Rivet, M.S.Zisman.

Z. Phys. A (Germany), vol.311, no.1-2, p.89-98 (1983).

Angular and energy distributions have been measured for products of $3\leq Z\leq 9$ from reactions of 336 MeV ^{40}Ar+$^{107.9}$Ag/^{154}Sm/^{197}Au. The c.m. differential cross sections and mean energies increase as one moves from ≈100 deg. to ≈170 deg. similar to those for fission or evaporation-like emission. Most characteristics mimic those observed for ^{4}He, but the cross-sections are smaller by a factor of ≈1/300 for each reaction studied. A semiclassical analysis has been used to estimate the effective barriers to emission and root-mean-square spins of the emitters. (33 refs.)

70579 Statistical analysis of the elastic and inelastic scattering of ^{12}C+^{28}Si and ^{16}O+^{28}Si. R.Singh (Dept. of Phys., North-Eastern Hill Univ., Shillong, India).

Z. Phys. A (Germany), vol.311, no.1-2, p.99-104 (1983).

A statistical model analysis has been performed on the $\theta_{\mathrm{c.m.}}=180°$ elastic and inelastic scattering excitation functions in the energy range $27.8\leq E_{\mathrm{c.m.}}\leq 31.5$ MeV for the ^{12}C+^{28}Si system and in the energy range $30.0\leq E_{\mathrm{c.m.}}\leq 32.7$ MeV for the ^{16}O+^{28}Si system. The exact calculation of the number of effective channels for inelastic excitation gives a value of ~1.5 corresponding to a change of 5° in the angle at which the cross sections are measured. The Hauser-Feshbach cross-sections, when compared to the experimental data, indicate very large (≥90%) direct reaction contributions to the observed cross sections. Good agreement between the theoretical and experimental distributions of the fluctuating cross sections together with the insignificant values of the cross correlation coefficient indicate that the fluctuating component of the experimental cross sections is consistent with the statistical model predictions. (19 refs.)

70580 Charge transfer prior to fusion. K.M.Hartmann (Sektion Phys., Univ. der Munchen, Munchen, Germany), D.H.E.Gross.

Z. Phys. A (Germany), vol.311, no.1-2, p.131-3 (1983).

In reactions between very asymmetric projectile-target systems charge is preferably transferred from the lighter to the heavier nucleus. This leads to a decrease of the potential barrier between the nuclei and increase of the fusion cross-section. The authors perform trajectory calculations with energy dissipation and proton transfer to estimate the magnitude of the effect. (10 refs.)

70581 Heavy-ion atomic physics. The decay of the vacuum and intermediate molecules. W.Greiner (Inst. fur Theoretische Phys., Johann Wolfgang Goethe Univ., Frankfurt am Main, Germany), W.Scheid.

In book: *Heavy ion collisions. Vol.3*, R.Bock [Ed.], p.299-482. Amsterdam, Netherlands: North-Holland (1982), x+666 pp. [0 444 85352 9]

Following a section on the autoionization of positrons, the authors cover the formal aspects of the change of a vacuum in overcritical fields. The authors discuss electron wave functions in overcritical electrostatic potentials, the effects of vacuum polarization and nonlinearities in the electromagnetic and spinor fields, and the two center Dirac problem. Other sections treat the decay of the neutral vacuum in overcritical fields during nucleus-nucleus collisions, background effects, overcritical phenomena for other fields and the case of broken symmetry, and dynamics of intermediate molecules, transitions in heavy ion collisions, selected effects in atomic heavy ion collisions, and finally the first QED experiments at GSI. (156 refs.)

70582 Hyperfine interactions in isolated ions. G.Goldring (Weizmann Inst. of Sci., Rehovot, Israel).

In book: *Heavy ion collisions. Vol.3*, R.Bock [Ed.], p.483-571. Amsterdam, Netherlands: North-Holland (1982), x+666 pp. [0 444 85352 9]

Having discussed the general concepts involved, the author goes on to treat the cases of cold and intermediate ionization of light nuclei. Hot ionization of heavy nuclei is also treated. (110 refs.)

70583 Neutral strange particles and π^0 production in the collisions of d and ^{12}C with Ta at 4.2 GeV/c/N momentum. G.Agakishiev.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.1

γ-conversion pairs and Λ^0 decays from d and ^{12}C collisions with Ta target have been measured. After corrections, the average π^0 multiplicity for dTa collisions is 1.1±0.2 and for C-Ta is 3.6±0.3. The average π^0 multiplicity is proportional to the number of interacting projectile nucleons. The average Λ^0 multiplicity for C-Ta inelastic collisions is 0.04±0.01. About 40% of Λ^0s lie outside the kinematically allowed region for N-N collisions. The average transverse momentum of Λ^0 is 500±50 MeV/c. (no refs.)

70584 Pion production by 86 MeV/nucleon ^{12}C ions on nuclei. E.Aslanides (Centre de Recherches Nucleaires de Strasbourg, Strasbourg, France), T.Bressani, M.Caria, E.Chiavassa, S.Costa, G.Dellacasa, P.Fassnacht, M.Gallio, F.Hibou, B.Minetti, A.Musso.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.2

The authors have measured the inclusive pion spectra produced at 0° by 86 MeV/nucleon ^{12}C ions on several nuclear targets (^{6}Li, ^{12}C, ^{27}Al, Cd and Pb). The experiment was performed by using the intense ($>10^{11}$ ions/second) beam from the CERN Synchro-cyclotron. The pion momenta were measured by means of a large solid angle magnetic spectrometer (Omicron). The momentum resolution was 2% fwhm. The measurements cover the range of pion momenta from 150 to 300 MeV/c and up to a sensitivity limit on the double differential cross sections of 10^{-36} cm^2/[sr. (MeV/c)]. The data are corrected for all the experimental uncertainties, including muon counting. (no refs.)

70585 A pion interferometry study of 1.5 GeV/A Ar-KCl collisions. D.Beavis, S.Y.Fung, W.Gorn, A.Huie, D.Keane, J.J.Lu, R.T.Poe, B.C.Shen, G.VanDalen (Dept. of Phys., Univ. of California, Riverside, CA, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.3

The authors report the preliminary results of a pion interferometry study of the negative pion source parameters for the reaction 1.5 GeV/A $\mathrm{Ar+KCl}\rightarrow 2\pi^- + X$. The triggered streamer chamber at Lawrence Berkeley Laboratory was used to acquire the data sample. The chamber was central-triggered on approximately 30% of the inelastic reaction cross-section giving an average negative pion multiplicity per event of 3.3. The sample includes 2700 events with $n_{\pi(\mathrm{sup.}\ -)}\geq 2$ which was used for this study. (3 refs.)

70586 Pion production below the free nucleon-nucleon threshold in heavy-ion reactions. J.P.Bondorf, C.Guet, B.Jakobsson, M.Prakash (State Univ. of New York, Stony Brook, NY, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.4

The results of pion ($\pi^\pm$) production from the CERN synchrocyclotron with ^{12}C beams of 60, 75 and 85 A MeV on ^{7}Li, ^{12}C and ^{208}Pb are investigated theoretically. The energy region is particularly interesting because it lies below the free nucleon-nucleon threshold of 290 MeV for the production of pions. Characteristic features of the data include: a) a smooth fall off of the double differential spectra for all targets, with an absolute cross section $\sim A^{2/3}$; b) a strong beam energy dependence of the absolute $\pi^\pm$ cross sections; and c) an increase in the π^-/π^+ ratio from unity for target nuclei with neutron excess. The authors perform detailed calculations on the basis of an independent nucleon-nucleon scattering model, with a view to establish its predictive capabilities. (2 refs.)

70587 Subthreshold production of neutral pions in heavy ion collisions. E.Grosse, H.Dabrowski, O.Klepper, C.Michel, W.F.J.Muller, H.Steltzer (GSI, Darmstadt, Germany), H.Noll, C.Brendel, W.Rosch, U.Lynen, P.Braun-Munzinger.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.6

First results are presented for the production of neutral pions produced by ^{12}C ions of 84, 74 and 60 MeV/u furnished by the CERN Synchrocyclotron impinging on targets of C, Al, Ti, Ni, Sn, Ta, Pb and U. (2 refs.)

70588 Backward particle production by protons and ^{12}C nuclei in emulsion at momenta 4.5 GeV/c/A. A.Abdelsalam, M.Sumbera, S.Vokal (Lab. of High Energies, JINR, Dubna, USSR).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.8

Various characteristics of events giving rise to the pions or protons emerging within the backward hemisphere (relative to the incoming particle) are investigated and compared with those in the forward region. (3 refs.)

70589 Alpha fragment emission in high energy nucleus-nucleus collision. R.Bhanja, N.A.L.Devi, R.R.Joseph, I.D.Ojha, M.Shyam, S.K.Tuli (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.10
The authors report on the α fragment emission in the interaction of ^{14}N with emulsion nuclei at 2.1 GeV/A. The report is based on the event by event analysis with the separation of H, CNO, AgBr targets in a total sample of 1093 interactions collected by the line scanning method in an emulsion stack of Ilford G5 exposed to ^{14}N at Berkeley Bevalac. (4 refs.)

70590 Alpha particle correlations in nucleus-nucleus collisions at relativistic energies. P.L.Jain, M.M.Aggarwal (Dept. of Phys., State Univ. of New York, Buffalo, NY, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.11
The authors used two stacks of Ilford G-5 emulsions exposed to ^{40}Ar and ^{56}Fe beams at ~2 A GeV and ~1 A GeV respectively from the Bevalac at Berkeley, California. Each beam was parallel to the pellicle surfaces. The pellicles were scanned by along-the-track method under high magnification. In the present experiment, they used about 600 primary interactions from ^{40}Ar at high energy and 650 interactions from the ^{56}Fe beam at low energy. From these interactions, they identified and measured very carefully the relativistic α-particles making angles up to 10 and 15 degrees with respect to the beam direction for higher and lower energies respectively. For α-particles, they plotted the polar vs. azimuthal angle in the laboratory system for these two beams. They also show the angular correlation of two or more α-particles produced at these two energies. There is a definite correlation of α-particles produced at small angles which corresponds to the low temperature interactions. (no refs.)

70591 Particle-particle correlation studies for the system $^{14}N+^{159}Tb$ at 12 MeV/A. R.K.Bhowmik, J.van Driel, R.H.Siemssen, P.B.Goldhoorn, S.Gonggrijp, Y.Iwasaki, R.V.F.Janssens, H.Sakai, K.Siwek-Wilczynska, W.A.Sterrenburg, J.Wilczynski (Kernfysisch Versneller Inst., Groningen, Netherlands).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.12
The energy and angular correlations of alpha particles in coincidence with different ejectiles (HI) have been studied for the reaction $^{14}N+^{159}Tb$ at 168 MeV. The ejectiles were detected at a fixed angle $\theta_{HI}=20°$ and the alpha particles were detected in the reaction plane. Coincidences with protons and neutrons have also been measured for the same HI angle. The angular distributions of particle-unbound projectile-like-fragments (PLF) have been investigated in a separate experiment by detecting the decay products in coincidence for varying the PLF emission angle. (2 refs.)

70592 Emission of low-energy light charged-particles in heavy ion reactions at intermediate energies—coincidences with target residues. B.Borderie, J.Galin, M.F.Rivet, I.Forest, R.Bombot, D.Gardes, B.Gatty, D.Guerreau, M.Lefort, H.Oeschler, S.Song, B.Tamain, X.Tarrago (Inst. de Phys. Nucleaire, Orsay, France).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.13
The emission of light charged-particles in heavy-ion induced reactions is a good probe of the reaction mechanisms. At incident energies below 10 MeV/u there is clear experimental evidence that most of the light particles are due to thermal emission from the compound nucleus or from fully accelerated and equilibrated fragments. In the intermediate energy region the situation is more complicated and particles with velocities strongly connected with the beam velocity are observed. The authors investigate C-induced reactions on a Ni target, at incident energies 30, 60 and 84 MeV/u, and focuses the study on the low energy part of the light charged particle spectra. An inclusive proton spectrum obtained at 90° in the lab system is shown. Measurements were performed in the forward hemisphere from 9 to 90° and the data analyzed in terms of invariant cross sections as a function of parallel and transverse velocities. (3 refs.)

70593 Light particle emission in the reaction $^{93}Nb+^{14}N$ at 132 and ^{208}MeV. T.Fukuda, M.Ishihara, H.Ogata, I.Miura, T.Shimoda, K.Katori, S.Shimoura, M.-K.Tanaka, E.Takada, T.Otsuka (Dept. of Phys., Osaka Univ., Osaka, Japan).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.15
The emission of fast light particles such as protons and alpha particles in heavy ion reactions has much attracted current interest because such light particles may probe the early stage of the reaction. The authors report on the emission of fast light particles in the reaction of ^{14}N on ^{93}Nb at 132 and 208 MeV. The experiment was performed at RCNP. The light particles were detected by conventional Si telescope and Si+15 mm High Purity Ge detector telescope. Measured angular range was typically from 8° to 160°. (no refs.)

70594 Light particle emission in α and ^{12}C induced reactions between 25 and 84 MeV/u. R.Glasow, G.Gaul, B.Ludewigt, R.Santo (Inst. fur Kernphys., Univ. Munster, Munster, Germany), H.Ho, W.Kuhn, U.Lynen, W.F.J.Muller.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.16
Spectra of light particles (p,d,t,^3He,α) emissed after bombardment of several targets with ^{12}C ions of 25 and 84 MeV/u (from cyclotron 'VICKSY' (HMI Berlin) and CERN (Geneva)) and α-particles of 25 and 43 MeV/u (from cyclotron 'JULIC', KFA Julich) have been measured at various angles. The spectra display an exponential-like slope and cross sections decreasing with increasing angles. (no refs.)

70595 Light-charged-particle emission as a probe of nucleus-nucleus collisions: identification of emission sources in very-heavy-ion reactions. M.Kaplan, M.Kildir, D.Logan, D.Moses, D.Eriksen (Dept. of Chem., Carnegie-Mellon Univ., Pittsburgh, PA, USA), J.Alexander, D.Guerreau, E.Duek, L.Vaz, N.Agitanand, L.Kowalski, M.Zisman.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.17
The authors have studied the emission of ^4He and ^1H in reactions of ^{40}Ar, ^{56}Fe, ^{86}Kr, and ^{238}U projectiles with several heavy targets at incident energies around 8.5 MeV/u. Using combinations of gas-ionization telescopes, Si detector telescopes, and a position sensitive avalanche detector, two- and three-fold coincidence measurements have been carried out to associate H/He emission with fission and/or deeply inelastic reaction fragments. In some cases, the fission-fragment correlation angle has served as a kinematic constraint to distinguish between fusion-like and inelastic collisions, and to identify the H/He corresponding to these two reaction types. (no refs.)

70596 Light charged particle emission from $^{20}Ne+^{197}Au$. H.Machner (Univ. Bremen, Bremen, Germany), G.Riepe, D.Protic, H.G.Bohlen, G.Fuchs.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.18
The study of light particle emission from heavy-ion induced reactions is a tool to investigate the underlying reaction mechanisms. At energies above the binding energy per nucleon spectra of secondary particles are dominated by preequilibrium emission and projectile break-up. Preequilibrium reactions have been successfully reproduced in light-ion induced reactions in terms of time dependent approaches. However, the situation in heavy-ion induced reactions is not so clear. Thus, have measured spectra of light charged particles ($Z\leq3$, $A\leq10$) over a large energy range. The reaction chosen was $^{197}Au+^{20}Ne$ at 392 MeV bombarding energy. (4 refs.)

70597 Nucleon multiplicity associated with energetic protons from the $^{12}C+^{60}Ni$ reaction. R.L.Robinson, R.L.Auble, J.B.Ball, F.E.Bertrand, R.L.Ferguson, C.B.Fulmer, J.Gomez del Campo, I.Y.Lee, R.W.Novotny, J.C.Wells, G.R.Young (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), C.F.Maguire, H.Yamada.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.20
$Z=1$-7 particles were observed in coincidence with energetic protons ($E_p>15$ MeV) that resulted from bombardment of ^{60}Ni with 191-MeV ^{12}C ions. The coincident particles were detected with 17 ΔE-E telescopes. The total number of nucleons in an event where one particle is a fast proton was deduced from the relation: $N=\Sigma M_iA_i+n+1$, where M_i is the measured multiplicity of particles (integrated over all angles and energies) with mass A_i in coincidence with the energetic protons; n is the number of neutrons which is assumed equal to the number of protons, and the 1 accounts for the gating proton. (1 ref.)

70598 Light charged particle coincidences with heavy fragments for the $^{40}Ar+^{208}Pb$ reaction at 10 MeV/n. J.C.Jacmart, Y.Blumenfeld, N.Frascaria, J.P.Garron, J.C.Roynette, H.Doubre, A.Gamp, E.Plagnol, E.Pollacco (Inst. de Phys. Nucleaire, Orsay, France).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.21
The angular correlation of light charged particles was measured in coincidence with heavy fragments emitted at a fixed forward angle from the $^{40}Ar+^{208}Pb$ reaction. The experiment was performed by bombarding a 500 $\mu g/cm^2$ ^{208}Pb target evaporated onto a 10 $\mu g/cm^2$ carbon backing with the 396 MeV ^{40}Ar beam from the ALICE accelerator of the Orsay laboratory. Heavy fragment identification was achieved by two different ways using: i) a conventional ΔE-E solid state detector; and ii) a time of flight measurement associated with an ΔE-E detector. The coincident light charged particles were detected over a large angular range in three large area detectors. (3 refs.)

70599 On the energy-distribution of diabatically emitted neutrons in heavy-ion collisions. W.Cassing, A.Lukasiak, W.Norenberg (Gesellschaft fur Schwerionenforschung, Darmstadt, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.23
Diabatic single-particle motion in heavy-ion collision induces highly excited s.p. states due to the direct coupling of the s.p. states to the collective motion. These highly excited states, which essentially have several nodes in the direction of the relative distance between the nuclei and only zero or a single node in the orthogonal direction, decay due to residual two body collisions with width $\Gamma\downarrow$ or due to the coupling to the continuum with width $\Gamma\downarrow$. The latter process is attributed to diabatic emission of protons or neutrons. In order to learn some features about the energy distribution of these light particles the width $\Gamma_\nu^\downarrow(\varepsilon_\nu-\varepsilon_F)$ (which is a function of the s.p. energy ε_ν above the Fermi-energy ε_F) was adopted from Bertsch (1978). The width $\Gamma_\nu^\uparrow(\varepsilon_\nu-E_F-\varepsilon_\nu^s)$, which in addition depends on the experimental separation energy ε_ν^s, was calculated in a two dimensional box model which generated s.p. states of the same nodal structure as the highly excited states in the two-center shell model. For fixed ε_ν the energy distribution $P_\nu^E(\varepsilon)$ then was assumed to be given by a gaussian centered around $\varepsilon_\nu-\varepsilon_F-\varepsilon_\nu^s$ with the width $\Gamma_\nu^\uparrow(\epsilon)$. The decay probability $P\downarrow(t)$ as well as the escape probability $P\uparrow(t)$ and the diabatic s.p. levels $\varepsilon_\nu(t)$ result from the calculations within dissipative diabatic dynamics. Final time integration then yields the differential cross-section dM_n/dE_n for the neutron multiplicity given by $dM_n/dE_n=\Sigma_\nu\int_0^\infty dt\ P_\nu^E(E_n,\ \varepsilon_\nu(t),\ \Gamma_\nu^\downarrow(t)).\ P_\nu^\downarrow(t)P_\nu^\uparrow(t)$. (4 refs.)

70600 Some systematics of total inclusive neutron cross sections for relativistic neon ions. R.Madey, B.D.Anderson, R.A.Cecil, P.C.Tandy (Kent State Univ., Kent, OH, USA), W.Schimmerling.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.24
Based on measurements of the inclusive double differential cross sections for neutron emission from 337 MeV/A Ne reacting in targets of C, Al, Cu, and U, the authors find that the total integrated cross section above a neutron energy T_0 is described well by the formula: $\sigma(T>T_0)=\bar{\sigma}_{NN}(R_G/r_0)^{\alpha(T0)}$, ($r_0=1.2$ fm). Here $\bar{\sigma}_{NN}$ is the isospin-averaged nucleon-nucleon cross section evaluated at an energy equal to the bombarding energy/nucleon, $R_G=r_0(A_p{}^{1/3}+A_T{}^{1/3})/2$, and $\alpha(T_0)$ is obtained from fits to the data. For $T_0=0$, $\alpha=5$. This cross section is always less than that for the primordial neutrons calculated in the participant-spectator model because some primordial neutrons form composite nuclei (e.g. d, t, ^3He, ^4He). For the collision of equal-mass light ($N=A/2$) nuclei, the ratio of the observed to the primordial cross sections is $(\bar{\sigma}_{NN}/\pi r_0{}^2)=0.65$ for $\bar{\sigma}_{NN}$ (337 MeV)=29.4 mb. This ratio is consistent with the cross sections for emission of d, t, and ^3He reported by Nagamiya et al. (1981) for 393 MeV/A Ne on NaF. (8 refs.)

70601 Neutron spectra from 390 and 790 MeV per nucleon Ne on Pb and NaF. R.Madey, B.D.Anderson, A.R.Baldwin, R.A.Cecil, J.C.Varga, J.W.Watson (Kent State Univ., Kent, OH, USA), G.D.Westfall.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.25
The authors have measured neutron time-of-flight spectra at angles of 0°, 15°, 30°, 50°, 70°, 90°, 120°, and 160° from neon ions of 390 and 790 MeV per nucleon at the center of (3.43 g/cm^2) Pb and (2.19 g/cm^2) NaF targets. Flight paths ranged from 8 m at 0° to 3.5 m at 160°. The apparatus measured the time difference between the detection of a neon ion in a beam telescope (consisting of two 0.8 mm scintillators) and the detection of a neutron in one of the eight, mean-timed, neutron counters. The energy resolution varied from 4% at 100 MeV, to 8% at 400 MeV, to 15% at 800 MeV.

Each event was associated with an r-fold ($0 \leq r < 14$) coincidence of charged particles with a 27 MeV threshold for protons. (3 refs.)

70602 Proton source emission in $^{14}N+^{12}C$ at 48 MeV. J.L.Quebert, D.Bertault, M.Boumart, J.N.Scheurer (Centre d'Etudes Nucleaires de Bordeaux-Gradignan, Gradignan, France).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.30
Central collisions of heavy ions have been extensively studied through inclusive measurements of light particles. The yield of such particles in the so-called midrapidity region of a rapidity plot is usually difficult to probe experimentally because detections near zero degrees are necessary. The authors study a light particle emission in such kinematic conditions in the specific case of a three-body final state. In such a case the light particle is considered as a missing mass in the detection, i.e. there is no need to detect it because a detection of the two remnant nuclei is sufficient. This indirect exclusive measurement is mainly useful when quasi complete correlations are performed; Dalitz plots and rapidity plots can then be deduced. They give an example of such a detection in $^{14}N+^{12}C$, studied with the tandem accelerator of Saclay. The purpose was to observe, by this method, p, d, α or neutrons over a large area of their rapidity plot. Quasi complete in-plane correlations between two heavy fragments were measured with two position sensitive gas telescopes set up on both sides of the beam direction between 19 and 35 degrees. (2 refs.)

70603 Light charged particle emission in 84 MeV/u C induced reactions on Ni. A comparison with an intranuclear cascade model. D.Guerreau, J.Galin, M.F.Rivet, B.Borderie, R.Bimbot, I.Forest, D.Gardes, B.Gatty, M.Lefort, H.Oeschler, S.Song, B.Tamain, X.Tarrago (Inst. de Phys. Nucleaire, Orsay, France).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.31
Intranuclear cascade (INC) models have been extensively considered in relativistic heavy ion collisions to compare with the experimental data. The range of validity of such models is not well defined, however it is generally thought that the assumptions they imply are fulfilled down to bombarding energies close to 100 MeV/u. The comparison is made on light charged particles arising from the 84 MeV/u C+Ni collisions. For low energy protons it is shown that the cumulated yields of protons emitted in both the cascade step and in the subsequent cooling down of the residual target-like nuclei always exceed the measured ones. The discrepancy is the most sensitive in the forward direction where particles arising from the individual collisions are more abundant than the evaporated ones. Conversely, in the same angular range the emission of α-particles is systematically underestimated. (5 refs.)

70604 Composite fragment production in intermediate energy heavy ion reactions. B.V.Jacak, C.K.Gelbke, L.H.Harwood, W.G.Lynch, D.K.Scott (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA), T.J.M.Symons, M.B.Tsang, G.D.Westfall.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.32
Inclusive production cross sections of isotopes of hydrogen, helium, lithium, beryllium, and boron have been measured for reactions of 50, 100, and 150 MeV/nucleon argon from the LBL Bevalac with gold and calcium targets. The differential cross sections were measured using three telescopes of solid state detectors, and are fitted with a moving source model to extract temperatures, source velocities and total cross sections in the intermediate rapidity region. This work extends the study of the production of intermediate rapidity light charged particles to heavier emitted fragments. As the study of heavy ion reactions move to intermediate energies where the transient system has excitation comparable to its binding energy, the production of composite fragments becomes important. The system can undergo statistical decay through many exit channels, or may explode at a certain temperature, leading to an increase in the charged particle multiplicity and a drop in the mean emitted fragment mass. (3 refs.)

70605 Low energy particles produced in heavy ion reactions. O.Scholten, H.Kruse, W.A.Friedman (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.33
Considerable attention has recently been focused on the reaction Ne on U at 400 MeV/N; where it has been suggested that the angular distribution of protons at low energies show evidence for collective phenomena. Coulomb forces and source velocities, however, influence the proton-spectra significantly in this energy regime. The authors present a calculation to show that the data, including side-peak features and neutron/proton ratios is consistent with a schematic model that involves little more than conservation laws, the long range Coulomb force, and a simple geometry based on two sources. (1 ref.)

70606 Inclusive break-up reactions of ^{6}Li at an incident energy of 26 MeV/nucleon. B.Neumann, H.Rebel, H.J.Gils, R.Planeta, J.Buschmann, H.Klewe-Nebenius, S.Zagromski, R.Shyam, H.Machner (Inst. fur Angewandte Kernphys., Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.38
The emission of fast light particles in nuclear reactions between two complex nuclei are characterized by rather large cross sections and unusual shapes of the energy spectra. In addition to complete fusion, which leads to formation of a compound nucleus, and to the emission of particles preceding the compound nucleus equilibration, the break-up of projectiles in the nuclear field has been found to be a dominant reaction channel accounting for a significant fraction of the total reaction cross section of light and heavy ion induced reactions, in particular at energies above 10 MeV/nucleon. The role of break-up reactions for the understanding of charged particle spectra from ^{6}Li-induced nuclear reactions is demonstrated. The authors present the results of systematic measurements of the inclusive double-differential cross sections for emission of light charged particles after bombarding ^{40}Ca by 156 MeV ^{6}Li ions. (3 refs.)

70607 Measurement of 30 MeV/A ^{12}C-induced reactions on ^{12}C, ^{58}Ni and ^{197} Au targets. A.Menchaca-Rocha, M.E.Brandan, M.Buenerd, J.Chauvin, D.Lebrun, P.Martin, P.de Santignon, J.C.Gondrand, I.Dorion, A.Lounis (Inst. des Sci. Nucleaires, Grenoble, France).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.39
The evolution with energy of the reaction mechanisms induced by light heavy ions in the range 20-86 MeV/A has been one of the motivations for the development of new accelerating machines. The authors present results from the first of such studies performed with the SARA system at Grenoble. The $^{12}C^{6+}$-30 MeV/A beam from SARA, typically 20 nA on target, with energy resolution $\Delta E \simeq 1.5$ MeV (fwhm), was used to bombard ^{12}C, ^{58}Ni and ^{197}Au self-supporting targets. Singles energy spectra and angular distributions ($\theta_{lab}=9°-30°$) of mass-resolved $Z=2-8$ outgoing reaction products were measured using a 100 μm+ 100 μm+ 5 mm solid state telescope. (1 ref.)

70608 Concidence study of ^{16}O projectile fragmentation at 100 MeV/u. J.D.Silk, R.L.Auble, J.B.Ball, F.E.Bertrand, M.E.Brandan, C.C.Chang, G.Ciangaru, A.A.Cowley, A.Guterman, D.L.Hendrie, H.D.Holmgren, I.Y.Lee, A.Menchaca-Rocha, A.C.Mignerey, S.Mills, R.L.Robinson, G.R.Roche, T.J.M.Symons (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.41
In-plane coincidence measurements have been made using an ^{16}O beam incident on a ^{58}Ni target at 100 MeV per nucleon. Analysis of events with peripheral signatures leads to several conclusions: two-body quasielastic breakup of the projectile does not significantly contribute to the cross section. Even when ^{12}C, α or ^{15}N,p coincidences are observed, there is typically on the order of 50 MeV of excitation transferred to the target. This figure is consistent with observations at lower energies. On the other hand, a dominant process involves the coincidence of a heavy beam fragment with fast protons well outside the fragmentation cone. There is, in fact, a large left-right asymmetry in these correlations for proton angles of ±55°. While the authors have not ruled out a kinematic origin for this effect, the fact that it persists for slow ($\leq$50 MeV) alpha particles at ±55° but is not observed at all at backward angles suggests that model calculations (such as angle dependent pre-equilibrium or fireball with shadowing) are in order. Correlations between light ions in the fragmentation region do not factorize. This suggests that in-flight decay of a prefragment is a significant component of the coincidence yield. (no refs.)

70609 Nucleon exchange in ^{56}Fe-induced reactions at 8.3 MeV/nucleon. H.Breuer, A.C.Mignerey (Univ. of Maryland, College Park, MD, USA), V.E.Viola,Jr., K.Kwiatkowski, K.L.Wolf, J.Birkelund, D.Hilscher, J.R.Huizenga, W.U.Schroder, W.Wilcke.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.42
A systematic measurement of projectile-like fragment nuclide distributions has been performed for 8.3 MeV/u ^{56}Fe ions incident on ^{56}Fe, ^{165}Ho, ^{209}Bi and ^{238}U. These studies were performed at the LBL superHILAC with a ΔE-E time-of-flight detector telescope which provided simultaneous Z and A identification with discrete Z and A resolution (<0.8 units). (no refs.)

70610 Dynamical coupling of relative motion, deformations and charge transfer in deep inelastic heavy-ion collisions. P.Frobrich, B.Strack (Han-Meitner-Inst. fur Kernforschung, Berlin, Germany), M.Durand.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.43
A multi-dimensional Fokker-Planck equation including relative motion, quadrupole deformations and charge transfer is derived from Brownian motion theory and solved within the quasi-linear approximation. Besides the usual radial and tangential friction frictional couplings between relative motion and deformation and between the vibrational modes turn out to be important. The authors found a universal parametrization that reproduces at least the rough features of Coulomb-like, focusing and orbiting systems. For the charge transfer they use the theoretical coefficients of Norenberg et al. (1978). (4 refs.)

70611 Multifragmentation in central, intermediate energy heavy ion collisions. B.Jakobsson, G.Jonsson, B.Lindkvist, A.Oskarsson (Dept. of Phys., Univ. of Lund, Lund, Sweden), J.P.Bondorf, I.Mishustin, C.Pethick.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.44
In an emulsion experiment data from central collisions induced by ^{12}C on Ag(Br) are extracted. Small impact parameter events are selected using the multiplicity criterion $N_{ch} \geq 11$. The collision energies are between 55 and 110 MeV per nucleon. The figure shows the charge distribution of all emitted particles in 75 collisions. For $Z \leq 8$ the particle identity is determined directly, while heavy recoil fragment identification in general is obtained by subtracting the sum of identified charges from $Z_{PROC}+Z_{TARG}=53$. (2 refs.)

70612 Charge equilibration for very heavy systems. R.Lucas, A.Gobbi, C.Gregoire, J.V.Kratz, U.Lynen, C.Ngo, A.Olmi, J.Poitou, H.Sann, G.Wirth (CEN Saclay, Gif-sur-Yvette, France).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.45
The present data are a part of an investigation of charge equilibration process in deep inelastic heavy ion induced reactions. The experiments (Kr+Au 6.5 MeV/A, Pb+Ge 7.5 MeV/A, Xe+Au 6.7 MeV/A) were performed at the UNILAC (GSI, Darmstadt). From the cross sections $d^4\sigma/d\theta dAdZdE$ the authors obtain the angle integrated isotope distribution. (3 refs.)

70613 Effects of the mass fragmentation potential on the mass diffusion phenomena. S.Yamaji, A.Iwamoto, K.Harada, S.Yoshida (Cyclotron Lab., Inst. of Phys. & Chem. Res., Saitama, Japan).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.50
The authors report on the analysis of the relaxation phenomena in the mass exchange for the reaction 1280 MeV $^{208}Pb+^{94}Zr$ on the basis of the linear response theory. Such phenomena has been shown to be well reproduced by the theoretical values of mass diffusion coefficients D_A for various reactions. However, the value of D_A calculated for the above reaction is $0.3/(10^{-23}$ sec). The authors solve the three dimensional coupled equations of motion with statistical fluctuations, taking the relative distance, deformation and projectile-like mass number A_1 as collective variables. (4 refs.)

70614 In-beam spectroscopy of $^{101,102,103}Tc$ via massive transfer reactions. D.R.Haenni, R.P.Schmitt, G.Mouchaty, T.T.Sugihara, U.Garg (Cyclotron Inst., Texas A&M Univ., College Station, TX, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.55
Massive transfer reactions can be combined with in-beam γ-ray spectroscopy to study nuclei with conventional fusion reactions. The relatively neutron rich $^{101,102,103}Tc$ isotopes where produced by $^{100}mo(^{7}Li,^{4,5,6}Hexn)$ reactions at 45 MeV. (3 refs.)

70615 Macroscopic and microscopic features of ^{6}Li-light nucleus scattering potentials at $E_{Li}=156$ MeV. S.Micek, H.J.Gils, H.Rebel, Z.Majka (Inst. fur Angwandte Kernphys., Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.63
The investigation of elastic scattering of ^{6}Li projectiles is of considerable interest since there is a change in the character of elastic scattering observed in the transition from light to heavy ions. At higher bombarding energies and light target nuclei nuclear rainbow scattering is observed, a feature, which has been found to lead to an increased sensitivity to the shape of the real potential in the case of α particle scattering. The authors report on studies of elastic scattering of 156 MeV ^{6}Li ions from ^{6}Li and ^{12}C. The experimental differential cross sections are analyzed on the basis of the optical model using various different phenomenological forms of the real part of the potential (including a quasi-model-independent Fourier-Bessel description). Additionally, a possible spin-orbit interaction is considered and the sensitivity of the experimental data to such a term is studied. (1 ref.)

70616 'Absolute' alpha transfer strength with ^{6}Li projectiles and alpha resonance width. M.S.Eswaran, D.R.Chakrabarty (Nuclear Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.65
The transfer of α-particles in (^{6}Li,d) reaction to a nuclear state which can also be formed as a compound nuclear resonance in α-scattering provides a unique basis for testing the reaction theory and DWBA assumption and affords a comparison of 'absolute' α-cluster spectroscopic strength S_α with the α-scattering resonance width Γ_α. The authors have chosen for such a study the case of $^{16}O(^{6}Li,d)^{20}Ne^*$ at $E_{Li}=32$ MeV leading to the 5.782 MeV state of ^{20}Ne which is also excited as an elastic scattering resonance in $^{16}O(\alpha,\alpha)^{16}O$ at E_α(Lab)=1.317 MeV with a measured width of $\Gamma F_\alpha=28\pm3$ eV. (6 refs.)

70617 Excitation of giant resonances by inelastic scattering of 400 MeV ^{16}O. T.P.Sjoreen, F.E.Bertrand, D.Shapira, R.L.Auble, E.E.Gross, D.J.Horen (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.66
Evidence for the exitation of giant multipole resonance has been observed in ^{90}Zr and ^{208}Pb by using inelastic scattering of 400 MeV ^{16}O ions, from the coupled operation of the tandem and cyclotron at the Holifield Heavy-Ion Research Facility. The experiment used solid state telescopes achieving an overall energy resolution of $\sim$500 keV FWHM. The beam contribution to this width is estimated to be about 200 keV. (no refs.)

70618 Study of the gamma decay of states excited via inelastic scattering of alpha and ^{16}O beams. J.P.Sullivan, R.K.Choudhury, U.Garg, L.Adler, J.D.Bronson, P.Gonthier, D.Haenni, Y.-W.Lui, G.Mouchaty, T.Murakami, M.N.Namboodiri, J.B.Natowitz, M.Parkin, R.P.Schmitt, S.Simon, D.H.Youngblood (Cyclotron Inst., Texas A&M Univ., College Station, TX, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.67
A series of measurements of gammas in coincidence with inelastically scattered projectiles have been performed at the Texas A&M cyclotron. The total gamma energy was measured with a high efficiency sixteen segment NaI counter which covered a solid angle of approximately 90% of 4 π. The inelastically scattered projectiles (as well as many other nuclei in the outgoing channel) were detected with a pair of three-element solid state telescopes at lab angles of 12 and 20 degrees. Data were taken with a 100 MeV alpha beam incident on a ^{90}Zr target as well as 180 and 310 MeV ^{16}O beams incident on ^{90}Zr, ^{144}Sm, and ^{154}Sm targets. The results on gamma rays from the decay of excited states in the regions the giant quadrupole resonance (GQR) and the low energy octupole resonance (LEOR) are discussed. (no refs.)

70619 Inelastic scattering of ^{12}C from ^{208}Pb to the second 0^+ state of $^{12}C^*$. R.Shyam, M.A.Nagarajan (SERC, Daresbury Lab., Daresbury, Warrington, England), A.C.Shotter, A.N.Bice, J.Cerny.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.68
Recently experiments performed at the 88″ cyclotron at Berkeley to measure the cross-sections for the inelatic scattering of ^{12}C from ^{208}Pb target exciting the second 0^+ state of ^{12}C, at the incident ^{12}C energies of ^{132}MeV, 187 MeV and 230 MeV are described. (2 refs.)

70620 Mutual inelastic excitations. O.Hansen, P.D.Bond, C.E.Thorn, M.J.LeVine (Brookhaven Nat. Lab., Upton, NY, USA), P.R.Christensen, S.Pontoppidan, F.Videbaek, M.J.Rhoades-Brown, Jiang Cheng-Lie.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.69
Mutual inelastic excitations have studied in the $^{28}Si+^{28}Si$, $^{28}Si+^{60}Ni$, and $^{28}Si+^{208}Pb$ reactions. The ^{28}Si beam was accelerated in the Brookhaven double Tandem facility and the scattered ^{28}Si ions were analyzed in a QDDD spectrometer and detected in a gas proportional focal plane detector. The $^{28}Si+^{28}Si$ reaction was studied at beam energies of ^{151}MeV and ^{180}MeV, the ^{60}Ni case at 140 MeV and ^{208}Pb at 210 MeV. In each case the inelastic scattering spectrum was measured as function of angle, covering an angular range corresponding to values of the elastic cross section from the Rutherford to 10^{-3} of Rutherford (Pb and Ni) or to 10^{-5} of Rutherford for Si. For angles from $\approx10^{-1}$ of Rutherford and forward, the ^{28}Si spectrum was dominated by the elastic peak and the peaks corresponding to excitation of the low-lying collective states (1.78 MeV 2^+ in Si, 1.33 MeV 2^+ in ^{60}Ni, 2.62 MeV 3^- and 4.07 MeV 2^+ in ^{208}Pb). At more backward angles the elastic peaks gradually become weaker than the low-lying collective transitions and the peaks gradually become weaker than the low-lying collective transitions and the mutual excitation of both target and projectile to the lowest collective states begin to take prominence. For $^{28}Si+^{28}Si$, the $2_1^++2_1^+$ and $2_1^++4_1^+$ mutual excitations becomes stronger than the corresponding single excitations at the most backward angles. The absence of strong double excitations of one of the participating nuclei is conspicuous. (2 refs.)

70621 High resolution excitation function measurements and resonant structures in the ^{16}O-^{16}O-system at the Coulomb barrier. W.Bickel, G.Gaul, W.Lahmer, R.Santo (Inst. fur Kernphys., Univ. Munster, Munster, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.70
The energy dependence of elastic ^{16}O-^{16}O scattering and various reaction channels has been investigated by measuring excitation functions in $\Delta E_{CM}=5$ keV to $\Delta E_{CM}=25$ keV steps as well as angular distribution. The measurements have become possible by the high currents (>20 μA) available at the Bochum Dynamitron Tandem Accelerator together with a jet gas target supplying an ^{16}O target of 1-15 $\mu g/cm^2$ equivalent target thickness. The data show strong energy variations even at energies below the Coulomb energy. From the correlations of structures in the excitation functions in different channels as well as the characteristic P_l^2-behaviour of the angular distributions in the $^{16}O(^{16}O,\alpha)^{28}Si$ reaction to a number of final states strong indications for resonant structures have been found and tentative spin assignments have been made. (no refs.)

70622 Spin of the $E_{CM}=30$ MeV intermediate width resonance in $^{12}C+^{12}C$ inelastic scattering. B.R.Fulton, J.S.Lilley (SERC, Daresbury Lab., Warrington, England), T.M.Cormier, P.M.Stwertka.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.71
Studies of the $^{12}C+^{12}C$ system at energies well above the Coulomb barrier have revealed a prominent series of intermediate width structures in the total cross sections for single and mutual excitation of the 2_1^+, 4.43 MeV first molecular rotational band identified at lower energies. Although tentatively identified as the 12^+, 14^+, 16^+ and 18^+ members, no direct spin assignments are available and this is a continuing uncertainty in any attempts at a model description of the resonant reaction mechanism. In a recent series of measurements the authors have investigated to what extent resonant strength also appears in the higher lying inelastic excitations. One feature of these measurements was the unexpected observation of a strong resonance in the yield to the O_2^+, 7.6 MeV state at $E_{CM}=30$ MeV where the supposed 16^+ resonance has been identified in the single and mutual 2_1^+ channels. This observation is particularly interesting since the angular distribution for decay of a resonant state into a spin zero exit channel should exhibit a pure P_J^2 (cosθ) form and this would provide the first direct spin assignment for one of the intermediate width resonances. (2 refs.)

70623 Spin alignment in $^{12}C+^{12}C$ inelastic scattering. W.Trombik, F.Krug, W.Dunnweber, W.Hering, D.Konnerth, R.Singh, W.Trautmann, D.Zeppenfeld (Sektion Phys., Univ. Munchen, Garching, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.73
Using the out-of-plane γ-ray-particle coincidence method the authors have measured the spin alignment with respect to the scattering normal, P_{zz}, of excited $^{12}C(2^+)$ nuclei from $^{12}C+^{12}C$ inelastic scattering in the energy range 16 MeV$\leq E_{cm}\leq$33 MeV. To detect the 4.44 MeV γ-rays two large-volume NaI detectors were used, positioned on either side of the beam with their axes coinciding with the reaction normal. (4 refs.)

70624 Energy dependence of heavy target fragmentation in nucleus-nucleus collisions. W.Loveland (Dept. of Chem., Oregon State Univ., Corvallis, OR, USA), K.Aleklett, P.O.McGaughey, R.H.Kraus,Jr., G.T.Seaborg.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.92
Reports the results of the radiochemical measurements of the yields, average energies and momenta and angular distributions of target fragments produced in the interaction of 12, 18, 45, 84, 94, 107, 250, 400, 1000 and 2100 MeV/u ^{12}C, ^{16}O and ^{20}Ne projectiles, with ^{181}Ta, ^{197}Au and ^{238}U. The average longitudinal momentum transfer, P_{11}^{trans}, leading to the production of light ($24\leq A\leq65$) fragments, fission fragments and spallation products has been deduced from measurements of target fragment recoil properties. (no refs.)

25.80 MESON- AND HYPERON-INDUCED REACTIONS AND SCATTERING

70625 Galileo-invariant theory of low energy pion-nucleus scattering. I. Impulse approximation and Fermi motion. R.Mach (Inst. of Nuclear Phys., Czechoslovak, Acad. Sci., Rez, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.5, p.549-57 (1983).
The scattering of a particle by a system of bound scatterers is investigated and reasons are given why the optical model and other models based on the standard impulse approximation violate the Galilean invariance. It is shown how this deficiency can be removed. Further, the validity of factorization approximation is studied. It is shown that there exists a unique combination of effective target particle momenta in the initial and final states, which minimizes the error caused by the factorization approximation. (17 refs.)

70626 The role of the Y_1* resonances in the $\bar{K}$-nucleus reactions at medium energies. N.Yamanishi, M.Kimura, Y.Takahashi (Dept. of Phys., Sci. Univ. of Tokyo, Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.535-41 (Feb. 1983).
The authors point out the importance of many-body effects on Y_1* resonances in the reaction $^{12}C(K^-, \pi^-)_\Lambda{}^{12}C^*$ at $p_K=800$ MeV/c by using the isobar-doorway model formulated for $\bar{K}$-nucleus reactions by Kisslinger (1980). The many-body corrections for Y_1*'s in nuclei are parametrized by using the resonance mass shift ΔM and collision-broadening factor β. It is shown that the cross sections calculated in this model tend to approach the observed data with the phenomenological value of ΔM related to the Σ-well depth. (11 refs.)

70627 Further evidence for the EELL effect. B.K.Jennings, N.de Takacsy (TRIUMF, Vancouver, BC, Canada).
Phys. Lett. B (Netherlands), vol.124B, no.5, p.302-4 (5 May 1983).
By looking at the inelastic scattering to the first excited 0^+ state in ^{12}C, it is shown that multiple scattering in the pion-nucleus system is strongly suppressed. (7 refs.)

25.85 FISSION REACTIONS

70628 Role of the deformation of multipolarity six in the dynamic description of spontaneous fission. K.Boning, A.Sobiczewski (Inst. for Nuclear Res., Warsaw, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.4, p.287-301 (April 1983).
The role of the deformation of multipolarity six, ϵ_6, in the description of spontaneous-fission half-lives is studied. Doubly even heavy nuclei (Z=92-102) are considered. It is found that inclusion of ϵ_6 may change the half-lives by up to about four orders. The structure of the microscopic inertia (mass) tensor, connected with ϵ_6, is also investigated. Finally, the equilibrium values of ϵ_6 are calculated. It appears that these quantities are of dynamic rather than static nature. (15 refs.)

70629 Fission-fragment kinetic energy and mass distributions for ^{252}Cf spontaneous fission. Bao Zongyu, Han Hongyin, Meng Jiangchen, Huang Shengnian (Inst. of Atomic Energy, Acad. Sinica, Beijing, China).
Chin. Phys. (USA), vol.3, no.1, p.129-36 (Jan.-March 1983). [received: May 1983]
Fission-fragment kinetic energy and mass distributions for ^{252}Cf spontaneous fission were obtained by correlation energy measurements using gold-silicon surface-barrier detectors. The results show that two pronounced shoulders exist on the mass distribution curves in the total kinetic energy region between 200-216 MeV. Each curve might be considered as composed of three components with the peaks located at about 107, 112, and 118 amu. (8 refs.)

70630 The cross-section for the binary and ternary fission of uranium and lead induced by 5.1, 8.8 and 12.7 GeV alpha-particles. Z.Todorovic, R.Antanasijevic (Inst. of Phys., Belgrade, Yugoslavia).
Nuovo Cimento A (Italy), vol.74A, ser.2, no.3, p.341-6 (1 April 1983).
The cross-sections for the binary and ternary fission of U and Pb induced by alpha-particles of energies at 5.1, 8.8 and 12.7 GeV have been determined by using a polycarbonate (makrofol) as a detector of the fission fragments. The values obtained for the cross-sections are discussed and compared with those obtained with high-energy protons. (11 refs.)

70631 Total kinetic energy release and mass distributions in prompt and delayed muon induced fission of ^{238}U. P.David, J.Hartfiel, H.Janszen (Inst. fur Strahlen- & Kernphys., Univ. of Bonn, Bonn, Germany), T.Johansson, J.Konijn, T.Krogulski, T.Mayer-Kuckuk, C.Petitjean, S.Polikanov, H.W.Reist, G.Tibell.
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.161-4 (28 April 1983).
The total kinetic energy release and mass distributions in prompt and delayed muon induced fission of ^{238}U were measured. A yield of prompt symmetric fission ($116 \leq A \leq 122$) of $(0.26 \pm 0.10)\%$ with a peak to valley ratio of 25 in the mass spectrum was observed. A ratio of prompt to delayed fission yields of $(8.8 \pm 0.3)\%$ is deduced. (12 refs.)

70632 Spontaneous fission half-life of ^{242}Cm. K.Raghuraman, N.K.Chaudhuri, A.V.Jadhav, C.K.Sivaramakrishnan, R.H.Iyer (Radiochem. Div., Bhabha Atomic Res. Centre, Trombay, Bombay, India).
Radiochem. & Radioanal. Lett. (Switzerland), vol.55, no.1, p.R114-83002 (17 Dec. 1982).
The spontaneous fission half-life of ^{242}Cm has been measured using solid state nuclear track detectors. ^{242}Cm was prepared by neutron irradiation of ^{241}Am, purified by using a rigorous ion-exchange procedure and assayed by alpha counting. The fission rate was measured by recording fission fragments in Lexan plastic detectors from planchetted sources of ^{242}Cm, for a known length of time and counting the total number of tracks registered. The measured spontaneous fission half-life is $(7.15 \pm 0.15) \times 10^6$ years, and is compared with the values reported in the literature. (11 refs.)

70633 Mass distributions of fission fragments emitted by highly excited nuclei. L.N.Andronenko, A.A.Kotov, M.M.Nesterov (Leningrad Nuclear Phys. Inst., Gatchina, USSR), W.Neubert, N.A.Tarasov, L.A.Vaishnene.
Z. Phys. A (Germany), vol.310, no.4, p.347-8 (1983).
The mass distribution of fission fragments emitted by highly excited nuclei have been investigated for the determination of some peculiarities of the fission process. It has been shown that the fragment mass distributions obtained by the time-of-flight method change their character in the region of Ag, as expected in the liquid drop model. The cascade-evaporation model and the statistical method of Fong (1978) describe the experimental data with a good accuracy. (8 refs.)

70634 Fission yields of In isotopes in the thermal neutron fission of ^{235}U. M.Shmid, G.Engler (Soreq Nuclear Res. Centre, Yavne, Israel).
Z. Phys. A (Germany), vol.311, no.1-2, p.113-16 (1983).
Fission yields of $^{124\text{-}132}In$ in the thermal neutron fission of ^{235}U were determined for the first time. Charge displacements $\Delta Z = Z_p - Z_{UCD}$ were calculated for the corresponding mass chains. Both fission yields and charge displacement values were compared with those obtained by systematics by Wahl et al. (1969) and Wolfsberg (1974). It was found that the fission yields of the In isotopes obey the Gaussian distribution. The displacement function of Wolfsberg seems to give the better representation of the experimental results. Half-lives of $^{124\text{-}131}In$ were determined from beta decay curves. (12 refs.)

70635 Investigation of linear momentum transfer on the $^{20}Ne+^{197}Au$ system at 30 MeV/A. G.Nebbia, E.Tomasi, C.Ngo, X.S.Chen, G.La Rana, S.Leray, P.Lhenoret, R.Lucas, C.Mazur, M.Ribrag (DPh-N/MF, CENS, Gif-sur-Yvette, France), C.Cerruti, S.Chiodelli, A.Demeyer, D.Guinet, J.L.Charvet, M.Morjean, Y.Pranal, A.Peghaire, L.Sinopoli, J.Uzureau, R.de Swiniarski.
Z. Phys. A (Germany), vol.311, no.3, p.247-8 (1983).
The authors have deduced the linear momentum transferred from the projectile to the fissioning nucleus in the reaction $^{20}Ne+^{197}Au$ at 30 MeV/A by measuring the folding angle between the two fission fragments. They found that the most probable linear momentum transfer represents 76% of the initial value. (2 refs.)

70636 Heavy nuclei disintegration mechanisms by 1 GeV protons. Yu.A.Chestnov, B.L.Gorshkov, A.I.Iljin, B.Yu.Sokolovski, G.E.Solyakin (Leningrad Nuclear Phys. Inst., Gatchina, USSR).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.26
It is known, that the irradiation of heavy nuclei by relativistic protons leads to nuclear fission with large cross section. This process is accompanied by different nucleon losses. The value of nucleon losses may serve as an important criterion for various disintegration mechanisms of heavy nuclei. A two-arm time-of-flight mass spectrometer with independent start-signal pickup, which allows nucleon loss measurements, has been employed for the investigation of heavy nuclei disintegration by 1 GeV protons. The collinear geometry of the flight paths perpendicular to the beam direction has made it possible to choose events with small longitudinal transferred momentum. The fragment sum mass distribution for ^{238}U, ^{232}Th, ^{197}Au and ^{184}W target nuclei are shown. (1 ref.)

25.88 FUSION REACTIONS

70637 Strong enhancement of subbarrier fusion due to negative hexadecapole deformation. M.J.Rhoades-Brown (Phys. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), V.E.Oberacker.
Phys. Rev. Lett. (USA), vol.50, no.19, p.1435-8 (9 May 1983).
Within a modified barrier penetration model the fusion cross section for ${}_8^{16}O+{}_{74}^{184}W$ is calculated at subbarrier energies. It is shown that nuclei with positive quadrupole moments and large negative hexadecapole moments have enhanced fusion cross sections over elongated systems only. Fusion measurements with such systems will provide a definitive answer to the question of deformation effects on subbarrier fusion. (11 refs.)

70638 Neutron-excess dependence of fusion−Ni+Sn. W.S.Freeman, H.Ernst, D.F.Geesaman, W.Henning, T.J.Humanic, W.Kuhn, G.Rosner, J.P.Schiffer, B.Zeidman (Argonne Nat. Lab., Argonne, IL, USA), F.W.Prosser.
Phys. Rev. Lett. (USA), vol.50, no.20, p.1563-6 (16 May 1983).
Excitation functions (E_{lab}=235-320 MeV) for producing nuclei close to the compound system (evaporation residues) were measured for $^{58,64}Ni+^{112\text{-}124}Sn$, corresponding to a 20% variation in the compound-nucleus neutron number. A dramatic, order-of-magnitude increase was observed in the maximum cross section as a function of the compound-nucleus neutron excess. The subbarrier energy dependence of the cross sections is well described by an optical-model calculation, but not by the frequently used parabolic approximation. (14 refs.)

70639 A note on the time scale for fusion of heavy ions. P.Braun-Munzinger, G.M.Berkowitz (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.19-21 (19 May 1983).
The reaction time for fusion of heavy ions is estimated in a simple barrier penetration model. Within this model the relevant time scale is obtained from the time 'delay' corresponding to tunneling through the interaction barrier. This time delay is estimated to be comparable or shorter than the travel time for the same distance when no barrier is present. This implies that high lying collective modes might influence the fusion process. (16 refs.)

70640 Multistep nature of heavy-ion fusion reactions. O.Civitarese, B.V.Carlson, M.S.Hussein, A.Szanto de Toledo (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Phys. Lett. B (Netherlands), vol.125B, no.1, p.22-4 (19 May 1983).
A systematic analysis of available light- and intermediate-heavy-ion fusion cross section data within the Statistican Yrast Line Model is performed. The intrinsic excitation energy needed for fusion to occur is found to depend linearly on the mass of the compound system. An interpretation of this dependence in terms of multistep processes is suggested. (15 refs.)

70641 Observation of radiative capture in the reaction $^{90}Zr+^{90}Zr$. J.G.Keller, H.-G.Clerc, K.-H.Schmidt, Y.K.Agarwal, F.P.Hessberger (Gesellschaft fur Schwerionenforschung mbH, Darmstadt, Germany), R.Hingmann, G.Munzenberg, W.Reisdorf, C.C.Sahm.
Z. Phys. A (Germany), vol.311, no.3, p.243-4 (1983).
Describes the radiative capture of a heavy ion in the reaction $^{90}Zr(^{90}Zr,\gamma)$ and predicts the fusion barrier. The evaporation residues were examined and the deexcitation channels identified by their subsequent α-decay. (7 refs.)

70642 Pionic fusion—an example of a coherent nuclear collision. K.Klingenbeck, R.Hupke, M.G.Huber (Inst. for Theoretical Phys., Univ. of Erlangen, Erlangen, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.5
In contrast to highly inclusive reactions which dominate nuclear collisions at intermediate energies the authors consider a rare process where two nuclei form a bound state $1\nu>$ of the united nucleus B; the total free energy of the system is carried away by a pion: $A_1+A_2 \rightarrow B\ (z\pm1,\ N\mp1)+\pi^{\mp}$. The analysis of such an exclusive reaction leads to two classes of rather unconventional questions concerning the reaction mechanism and the spectroscopic structure of the nuclei involved, respectively: (i) How can the thermalisation of the energy be avoided? Evidently, the total kinetic energy of the entrance channel is transferred to a single degree of freedom, the pionfield. (ii) Which states $|B_\nu>$ are excited by a given entrance channel fragmentation? This is related to the spectroscopic parentage between the state $1\nu>$ and the corresponding target projectile combination $|A_1A_2>$. From present understanding of these reactions the authors deduce the following conclusions: (i) the reaction is highly selective: the cross section depends sensitively on the spectroscopic decomposition of the state $|B_\nu>$; depending on the target projectile fragmentation the forward cross section for light ions may vary near threshold from 10 pb/sr to 100 nb/sr; (ii) the excitation of the high spin members of a given dinuclear structure is particularly favoured as a result of the strong kinematical mismatch; (iii) the reaction can be used for the ultracold production of new isotopes. (3 refs.)

70643 Thermal neutron extrapolation distances for slabs of beryllium and water. P.Mohan, R.Mohan, F.Ahmed, L.S.Kothari (Dept. of Phys. & Astrophys. Univ. of Delhi, Delhi, India).
J. Phys. D (GB), vol.16, no.5, p.715-22 (14 May 1983).
Extrapolation distances for thermal neutrons have been obtained for slabs of beryllium and light water by minimising the difference between the steady-state leakage spectra calculated on the basis of diffusion and transport theories. Using the present values of extrapolation distance ensure that neutron spectra (both in beryllium and water) calculated on the basis of diffusion theory agree well with the corresponding transport theory spectra, even at distances close to the free surface. The authors find the extrapolation distance to be dependent of the thickness of the slab, increasing with increase in the thickness. (19 refs.)

28.41 FISSION REACTOR THEORY AND DESIGN

70644 Analysis of natural convection using penalty finite elements: laminar flow analysis and turbulent flow analysis by mixing length theory. Y.Eguchi, G.Yagawa, Y.Miyauchi, M.Masuda.
J. At. Energy Soc. Jpn. (Japan), vol.25, no.2, p.133-9 (Feb. 1983). In Japanese.
An application of the penalty finite element method to incompressible viscous flows is studied. The authors applied this method to a typical flow problem of the transient natural convection. Since, in this method, it is not necessary to deal with the incompressibility constraint and pressure can be eliminated from the equation systems, the computational efforts are considerably reduced. This method is proved to be effective in the case of the natural convection analysis. They also analyze the turbulent flows with the simple method using the Prandtl's mixing length theory. The numerical results show good agreements with experimental as well as theoretical values. (17 refs.)

70645 Application of the ASME-code-case N 47 to a typical thick-walled HTR-component made of Incoloy 800. F.Kemter, A.Schmidt (Hochtemperatur-Reaktorbau GmbH, Mannheim, Germany).
8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.2/1-21 In German.
Since HTR plants operate at temperatures above 500 deg.C, the materials for various components must be chosen with regard not only to fatigue but also to creep properties and inelastic expansions. The ASME-High Temperature CCN47-Code gives a safe guide but experience has shown that it may in some cases lead to over-design. A curve gives creep characteristics of Incoloy 800 as a function of time at a pressure of 200N/mm^2. Sketches of the range of plastic, cyclic-plastic deformations, transients and load histograms are given. (no refs.) *G.R.S.*

28.42 FISSION REACTOR MATERIALS

70648 Basalt glass ceramics for the immobilization of transuranic nuclear waste. L.A.Chick, R.O.Lokken (Pacific Northwest Lab., Battelle, Richland, WA, US), L.E.Thomas.
Am. Ceram. Soc. Bull. (USA), vol.62, no.4, p.505-9, 516 (April 1983).
A reference transuranic (TRU) nuclear waste was found to be similar in composition to natural basalt, a leading candidate for a deep geologic repository. Because of this similarity it is particularly desirable to develop basalt-based TRU waste forms. A basalt glass-ceramic containing 50 wt.% TRU waste was developed and characterized. Crystallization of the parent glass produces a material containing about 15 wt.% of titaniferrous hematite and 20 wt.% of two clinopyroxenes in a continuous glass matrix. Static leach testing revealed that the glass-ceramic has slower leach rates than the parent glass. The improvement in leach rate is thought to be caused by an increase in glass matrix durability due to the removal of alkaline-earth elements during crystallization. (13 refs.)

70649 Nuclear waste management in Sweden. W.Gries.
Atomwirtsch.-Atomtech. (Germany), vol.28, no.5, p.273-5 (May 1983). In German.
The present contribution to electricity generation by nuclear power in Sweden is almost 40%. For this limited nuclear program a realistic waste management program has been drafted, which is already being implemented. Nuclear waste management is restricted to handling the radioactive waste associated with nuclear power plant operation. A temporary storage facility for spent fuel elements is under construction, a special ship for fuel transports has been delivered, the construction permit for the repository designed to accommodate low and medium level wastes, which is to be ready for use in 1988, will probably be granted this year. A temporary storage facility for vitrified high level waste and a temporary storage facility for transuranium waste are to be completed by 1990. The repository for high level waste is to be operational not before 2020. (10 refs.)

70650 Oxide stripping from AGR fuel can by sputter ion plating (SIP). J.P.Coad (AERE, Harwell, England), R.K.Wild.
Appl. Surf. Sci. (Netherlands), vol.14, no.3-4, p.321-9 (March 1983).
A novel technique for removing oxide from iron based alloys, involving sputter ion plating (SIP) of nickel at elevated temperatures, has been recently developed at Harwell. The SIP of nickel is used to apply stress to the oxide which causes it to fracture. This method has been used to strip oxide from a 20% Cr/25% Ni/Nb stabilised steel oxidised in CO_2 at 1123 K. Both the alloy and oxide side of the metal/oxide interface is exposed and surface analytical techniques have been applied to characterise the interface. This paper describes the preliminary results of this work and gives an assessment of the possible future applications of the technique. (16 refs.)

70651 Thermal aspects of radioactive waste burial in hard rock. D.P.Hodgkinson, D.A.Lever, J.Rae (Theoretical Phys. Div., AERE, Harwell, England).
Prog. Nucl. Energy (GB), vol.11, no.2, p.183-218 (1983).
One of the possible methods that has been considered for the disposal of radioactive waste is deep burial in stable rock formations. The authors review recent work on modelling the way in which the heat emitted by the decaying radionuclides in the waste could affect this disposal option, emphasizing both the effects on depository design and on migration by flowing groundwater. It focuses particularly on research in the UK into the feasibility of burying high-level waste in fractured crystalline rock. After introductory sections on the characteristics of the waste and rock, there are three major sections on the temperature field in the surrounding rock, the stresses generated in the rock, and the groundwater flow. (154 refs.)

70652 Dynamic analysis simulator and condensate demineralizer operation of the radioactive waste treatment system for a BWR power plant. H.Mikawa, T.Ito, Y.Kato (Energy Res. Lab., Hitachi Ltd., Ibaraki, Japan).
J. At. Energy Soc. Jpn. (Japan), vol.25, no.2, p.126-32 (Feb. 1983). In Japanese.
Describes the dynamic analysis simulator, the condensate demineralizer operation, and the components of a monitoring system of the radioactive waste treatment system (R/W) for a BWR power plant. The simulation and the monitoring system have the following features: (1) The simulator can predict the few days future operating characteristics of R/W. (2) The operating conditions of the condensate demineralizer are displayed on the cathode ray tube (CRT) as guidance. By following this guidance, the condensate demineralizer can be regenerated at regular and appropriate intervals. (3) The plant conditions from the generation of liquid waste to final treatment process are displayed in the following steps: R/W total system→Particulars of each liquid waste treatment system→each component of the treatment system. (7 refs.)

70653 Treatment of radioactive wastes by calcination. P.Ditl, J.Jecmen (CVUT, Praha, Czechoslovakia), J.Napravnik, L.Neumann.
Jad. Energ. (Czechoslovakia), vol.29, no.4, p.145-8 (April 1983). In Czech.
This paper provides supplementary information about the treatment of radioactive wastes reported in pt.I (1981). Possible types of calciners are described and discussed. On the basis of experiences and calculations the new type of a calciner and pilot plant device for calcination and denitration have been developed and operated under non-radioactive conditions for about 1200 hours. Obtained calcination product was found suitable for further treatment. Also a performance test under the real radioactive conditions which was carried out on the nuclear power plant in Jaslovske Bhunice was successful. (8 refs.)

70654 Factors influencing the choice of processes for the treatment of intermediate-level wastes. J.R.Grover, N.J.Keen (UKAEA, Harwell, England).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.33-50
The wastes considered are defined by the IAEA as intermediate-level wastes—i.e. those wastes which, because of their radionuclide content, require shielding but need little or no provision for heat dissipation during their handling, transportation and disposal. Thus, transuranic wastes, fuel element cladding, miscellaneous sludges and concentrates from the treatment of liquid effluents from reprocessing plants and reactors, miscellaneous items of redundant plant, etc., are covered. There are many factors that can affect the choice of waste treatment, conditioning and packaging methods and the ultimate form of disposal. For each type of waste it is necessary to take into consideration every step in the overall system from waste arising to final disposal if an optimum solution is to be achieved in terms of economics and environmental impact. The factors that should be considered include: (1) control of wastes at point of arising (i.e. minimization and segregation); (2) level and nature of activity; (3) physical form of the wastes; (4) waste treatment process options, i.e. removal of activity, secondary effluents, quality of the final waste form, i.e. leach resistance, radiation stability, etc., volume of the final waste form, radiation dose to operators, treatment costs, interim storage costs; (5) transport requirements and costs; (6) disposal system, i.e. site selection (geological barrier to radionuclide migration), design and type of repository engineering (i.e. additional barriers), and costs. (4 refs.)

70655 Guideline for immobilization, packaging and storage of low- and intermediate-level radioactive wastes. J.Aeppli (Nuclear Safety Dept., Federal Office of Energy, Wurenlingen, Switzerland).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.51-5
Waste acceptance criteria for disposal have not yet been established in Switzerland. A guideline for immobilization, packaging and storage of low- and intermediate-level radioactive wastes from nuclear power plants in Switzerland became effective in 1980. This guideline is a basic document for the Swiss Nuclear Safety Department for licensing purposes and has the following aims: to define essential requirements; to specify quantitative limits; to provide some guarantee for acceptance of waste for disposal. The author deals with different requirements mentioned in the guideline either qualitatively or quantitatively. One of the important values is the maximum leach rate of 10^{-2} $kg.m^{-2}.d^{-1}$ measured over a period of 150 days. The test method is in conformity with the prescription laid down in a draft version by the International Organization for Standardization. Another main requirement is the stability of the submerged waste form against swelling and cracking. Wastes from reprocessing of spent fuel are not covered by this guideline. (no refs.)

70656 The function of waste immobilization as a barrier against radionuclide release in the frame of an overall risk assessment. F.Girardi (Comm. of European Communities, Joint Res. Centre, Ispra, Italy).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.57-67
The general approach to safety assurance in disposal of radioactive waste is the 'multi-barrier' or 'defence-in-depth' approach. Research has been mostly directed to characterize individual barriers in order to learn what performance may be expected from the barrier when utilized in a hypothetical safety system. The knowledge available is briefly reviewed, with special reference to ongoing activities carried out within the framework of the waste management programme of the European Communities. The interaction between different barriers in a geological disposal environment is not sufficiently well known to permit a full appreciation of the long-term behaviour of a barrier system. Examples of studies under way within the programme mentioned above are outlined briefly. On the basis of the information available, immobilization of high-level waste in borosilicate glass appears an acceptable barrier, well-integrated in the various barrier systems. Studies on the long-term properties of conditioned alpha-contaminated waste deserve a high priority in order to make a balanced evaluation of the long-term risks of the various waste types. (11 refs.)

70657 Effects of ionizing radiation during the disposal of radioactive wastes into geological formations. V.I.Spitsyn, V.D.Balukova (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.69-76
Basic propositions related to the specific features of the thermal and radiation influence of high-activity wastes on the geologic environment of repositories are considered. Boundary values of admissible dose loads on protective barriers on the basis of aluminium silicate minerals are proposed. Data on the effects of ionizing radiation on the surface properties of minerals are put forward. (7 refs.)

70658 High-level reprocessing waste package requirements for a deep borehole disposal facility to be mined in a salt dome. J.Hamstra (Netherlands Energy Res. Found., Petten, Netherlands).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.77-86
The ultimate disposal of high-level waste may entail waste package requirements that differ from or complement those originaly specified for the immobilization process. Waste package requirements are presented for a disposal concept based on the use of deep boreholes, as in a Netherlands concept for a facility to be mined in a salt dome. Most attention is given to the rather stringent rock salt temperature limitations that were formulated in anticipation of the presence within the repository area of minor bands of K and/or Mg salts. For three different canister diameters a review is given of the variations in the high-level waste and the disposal-geometry parameters as calculated to be consistent with the predetermined maximum rock salt temperatures. The canister construction and its wall thickness are discussed in relation to the stacking load and the rock pressure build-up around the emplaced canisters due to borehole convergence and a subsequent temporary excess of rock pressure due to thermal loading. Finally, it is argued that carefully developed deep borehole disposal in a salt dome involves no additional waste package requirements deriving from the generic safety assessment other than that the waste form should be solid. (4 refs.)

70659 PILO—a Swedish concept for the central treatment of spent ion-exchange resins. C.Thegerstrom (Swedish Nuclear Fuel Supply Co., Stockholm, Sweden), B.Bergstrom.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.89-100
A new method for the treatment of spent ion-exchange resins from nuclear power plants has been studied in Sweden. In a special process the radionuclides are transferred from the spent organic resins to zeolites/titanates. The zeolites/titanates are then sintered to a stable ceramic body of small volume, while the low-level eluted resins are either dewatered in transportable concrete containers or incinerated. The main functions of the new method (PILO process) have been verified in experiments. On the basis of this R&D work, industrial-scale system design studies have been made, including transport requirements, integrated process flow sheets and cost estimates. The full-scale system comprises: transport of spent organic resins from power plants to a central treatment plant; elution of medium-level resins and sorption of eluted nuclides on zeolites/titanates; sintering of active zeolites/titanates into ceramic bodies; and incineration of eluted organic resins and other low-level organic resins (optional). An evaluation of such a new system designed to cover the needs of the Swedish nuclear programme shows that it is technically feasible to introduce the PILO process on an industrial scale. It is, however, economic only if incineration of low-level resins in included in the system. (2 refs.)

70660 Experience in industrial operation of the plant for immobilizing radioactive wastes in thermosetting resins at the Ardennes Nuclear Power Station. P.Haller, P.Romestain (Centrale Nucleaire des Ardennes, Chooz, France), G.Aude, J.P.Bruant.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.101-32 In French.
The French Atomic Energy Commission has developed, at the Grenoble Centre for Nuclear Studies, a procedure for immobilizing low-and intermediate-level wastes in thermosetting resins of the polyester or epoxy types. To demonstrate feasibility on an industrial scale, a pilot plant has been set up at the effluent treatment station of the Ardennes Franco-Belgium Nuclear Power Station, which is a 305 MW(e) PWR type. Assembly work began in January 1979. After a period devoted to final adjustments and operation with inactive products, conditioning of active products began in January 1981. The methods of conditioning the three types of waste (evaporation concentrates, ion exchange resins and filter cartridges) are described, experience of the start-up and operation of the plant is reported and the principal results of coating characterization tests are given. The results of tests on active and inactive products show that the characteristics of the materials obtained on an industrial scale match those of laboratory products and confirm their high quality with regard to mechanical behaviour, fire resistance, homogeneity and low-leachability. Industrial experience and economic comparisons show that the process of immobilizing waste from nuclear power stations in thermosetting resins offers an extremely interesting alternative to classical methods of conditioning. (1 ref.)

70661 Solidification of radioactive wastes using thermoplastic resin. Y.Hayase (Niigata Engng. Co. Ltd., Tokyo, Japan), N.Moriyama, M.Hayashi, M.Kurita.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.133-45
A new method has been developed by Niigata Engineering Company, Japan, of solidifying BWR wastes, i.e. evaporator concentrates, spent ion-exchange resins (granular and powder), and filtration sludges (cellulosic materials and diatomaceous earth), using thermoplastic resin as the fixing agent. Due to the fact that in Japan a suitable method for the final disposal of nuclear wastes has not yet been decided upon, at NEC the authors proposed and developed their own process. The method was developed with the following objectives in mind: (1) reduction of waste volume; and (2) effective immobilization of radionuclides. After close examination of the existing methods of waste treatment, i.e. solidification of wastes into monolithic block form with sea dumping as the means of the final disposal, and solidification of wastes into pellet form for interim storage until disposed of, after experiments a new method of binding wastes with thermoplastic resin was developed. Using this process only one system component is needed to produce both of the above-mentioned forms of solid waste. The process was tested by solidifying some wastes containing ^{60}C and ^{137}Cs adsorbed by adding $^{60}CoCl_2$ and $^{137}CsCl$ solutions to waste slurries. The safety of the process and the behaviour of the radionuclides at each step of the process were closely checked. Subsequently the solidified products were tested and evaluated. Monolithic products were tested to determine such factors as density, uniformity, mechanical strength and leachability. Pellet form products were evaluated mainly with regard to maximization of volume reduction and mechanical strength; more than acceptable results were achieved in all cases. (8 refs.)

70662 Low- and medium-level aqueous radioactive waste immobilization with water-extendible polymers. A.S.Williamson (Res. Div., Ontario Hydro, Toronto, Ontario, Canada).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.147-54
The use of water-extendible polymers as an alternative to cement for the immobilization of aqueous radioactive wastes is detailed. The process involves formation of a water-in-oil emulsion between the aqueous waste and the organic polymer and solidification of the emulsion by addition of suitable peroxide catalyst/promoter combinations. Emulsion quality is critical to the attainment of satisfactory waste forms. High speed, high shear agitation is needed to obtain the aqueous phase droplet size and dispersion needed to give stable emulsions. The pH of the aqueous waste should be adjusted to between 7 and 9 to facilitate emulsion formation. It is also suggested that the aqueous waste: polymer ratio should not exceed 1:5:1 by volume. As incorrect waste condition, unsuitable mixing or improper cure agents can cause a process malfunction, small-scale trials with all wastes are recommended to determine special requirements before commencing production runs. Immobilized wastes should be smooth, hard monolith forms with high compressive strengths and good freeze/thaw and water resistance. If fully exposed to air the waste form will slowly lose water by evaporation. This feature may dictate the use of plastic or lined containers to prevent corrosion if any water condensation occurs in the ullage space above the waste form. Wastes immobilized with

water-extendible polymer are considered to have acceptable leaching resistance and waste type appears to have little effect on leach rate. Over a one-year test period cumulative percentage activity released was about 1%. (no refs.)

70663 Immobilization of waste-water residues by embedding into concrete. E.Zange, W.Schlenter, M.Laser (Decontamination Dept., KFA Julich GmbH, Julich, Germany).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.155-66
Low-level radioactive waste water is concentrated by evaporation. The concentrate is further evaporated to dryness by means of a rotary drum drier. The dry solid is immobilized with cement. From the drum drier solid/cement/water-mixture samples are taken. After a period of 28 days the leach rate of Cs, Sr and Co and the compressive strength of the specimens are determined. The leach rate can be described by diffusion during a starting period of about 7 to 14 days. After about 300 to 550 days, depending on the composition of the specimen and the isotope, the leach rate becomes constant. The leach rate increases with increasing dry solid/cement ratio. Other waste components (e.g. sulphate) can increase the leach rate appreciably. The influence of sulphate can be overcome by addition of $Ca(OH)_2$ and/or reduction of the dry solid/cement ratio. The compressive strength of the specimens is of the order of about 15 N/mm^2 with a minimum of about 6.4 N/mm^2 and a maximum of about 25 N/mm^2. It increases with decreasing water/cement ratio and dry solid/cement ratio. As expected, the leach rate decreases with increasing compressive strength. However, this correlation is relatively weak because of the influence of many factors on the properties of the immobilized waste form and the limited amount of data from leaching experiments. Based on these results the formula for the conditioning of drum drier solid has been optimized as regards volume reduction and quality of the waste form. (no refs.)

70664 A process for the immobilization of a radioactive waste (inorganic ion-exchange material) in a cement matrix. A.D.Elsden (British Nuclear Fuels Ltd., Risley, Warrington, England), J.Sims, K.Harding.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.167-76
A process for the immobilization of an inorganic ion exchange resin in a cement matrix is presented. The selection of the preferred matrix is described, alternative cementation processes reviewed and a flowsheet, flow diagram and plant layout of a conceptual design presented. The results of a R&D programme on the evaluation of the immobilized waste form are given. (5 refs.)

70665 Treatment of plutonium-contaminated metallic waste by the electro-slag melting method. A.Ochiai, K.Kitagawa, Y.Sawada (Kobe Steel Ltd., Kobe, Japan), S.Izuhara, K.Ohtsuka.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.177-90
Kobe Steel Ltd. and Power Reactor and Nuclear Fuel Development Corp. have developed an entirely new process for treating plutonium-contaminated metallic waste. The electro-slag melting method is a process in which contaminated metal is melted in the molten slag in a copper mould by Joule heat generated with large amounts of electrical current and then gradually solidified in the same mould. The development consisted of two experimental phases where the effect of decontamination and immobilization was studied using HfO_2 to simulate PuO_2. First, a pilot electro-slag melting furnace was built and tested, and secondly, a technical test furnace was fabricated to confirm the first phase results. This technical test furnace was approximately as large as the furnace we are now designing for the plutonium waste treatment facilities. The ratio of volume reduction was optimal and would be 1/25 if the ingot fill in the storage vessel were 0.5. The decontamination factor of the metallic waste was 25. Of the different electrodes tested, two tungsten nonconsumable electrodes were found to be the most suitable for melting pieces of metallic waste. $CaO/Al_2O_3/B_2O_3$ slag was determined to be the most suitable slag. (5 refs.)

70666 Research on the management of fuel cladding waste. B.Huber (Comm. of the European Communities, Brussels, Belgium).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.191-203
Cladding waste, arising in fuel reprocessing plants, has a considerable radioactivity content including long-lived radionuclides and should, therefore, be conditioned appropriately prior to disposal. The author gives a survey of research and development work on cladding waste characterization, decontamination and conditioning. Most of the work reported has been performed under the European Community's R&D programme on management and storage of radioactive waste, but information on other work has also been included. A wide range of conditioning methods for cladding waste has been developed to various stages, in particular: role compaction and embedding in concrete; press compaction and embedding in a lead alloy; embedding in various other matrix materials, i.e. borosilicate glass, graphite, aluminium, alumina; special melting techniques, i.e. eutectic melting and Inductoslag melting; hot isostatic pressing; and conversion of Zircaloy to zirconia. (12 refs.)

70667 Conditioning of metallic Magnox fuel element debris. C.J.Kaye (CEGB, Manchester, England).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.205-22
The conditioning of metallic Magnox debris poses particular problems arising from its chemical reactivity and from the presence in discrete amounts of highly radioactive components. The treatment of this waste is currently being studied by the Central Electricity Generating Board. Following retrieval from store it is envisaged that the debris will be dried and comminuted to facilitate the removal for further storage of the highly active components from the bulk debris. A satisfactory means of sorting the debris appears to be by magnetic induction. The relatively low activity but potentially reactive Magnox will then be directly encapsulated prior to disposal off-site. Currently the only disposal route open for this waste is to the deep ocean. Matrices for encapsulating Magnox have been developed and others are under investigation. The desirable features of such matrices include low chemical reactivity and impermeability to water. The methods used to characterize the resultant waste forms and the results obtained are presented. Thermosetting polymers produce suitable waste forms for sea disposal, exhibiting high mechanical strength and resistance to leaching, and possessing very low chemical reactivity with respect to the Magnox waste. Low viscosity matrices are advantageous from the point of view of the process plant engineering as they enable the comminuted waste to be directly encapsulated. (6 refs.)

70668 Fixation of calcined waste by bituminization or cementation. J.Napravnik, M.Kyrs (Nuclear Res. Inst., Rez, Czechoslovakia), P.Ditl.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.223-8
The overall concept is given of the combination of calcination with fixation into bitumen, cement, etc. The design is shown of a calciner with the capacity of 10 L/h which was tested on real radioactive wastes for 2000 h. The geometrical and operating parameters of the apparatus have been optimized based on a statistical evaluation of the experiments. Wastes containing nitrates are calcinated at 300-500°C, yielding oxides. Wastes containing sulphates, carbonates, $KMnO_4$, or borates are calcined at 150-300°C, yielding soluble salts. The content of H_3BO_4 and $Na_2B_4O_7$ and in some cases of sulphates in the calcinate retards hardening of the mixture with cement. Nitrates and detergents also interfere. The effect of the above components on the products mixed with bitumen is much less. Detergents can be decomposed at 200-300°C; organic acids can be reacted with Al salts to form insoluble substances lowering the leaching rate of Sr and Cs; small amounts of SiO_2 eliminate the effect of borates on cement hardening. The drawbacks of bituminization with bitumen emulsions are the complicated preparation of the emulsion, higher leaching rate of the product and low stability of the emulsion against breaking. The leachability was determined (1-50 days) of different products containing LWR wastes. (4 refs.)

70669 Conditioning of low-heat-generating radioactive waste by incorporation in barrier-impregnated composite matrices—a review of experience in industrial-scale operation. Kanwar Raj, P.K.Wattal, N.Chanana, M.K.S.Ray, M.S.Kumra (Waste Management Div., Bhabha Atomic Res. Centre, Bombay, India).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.229-44
The extent of conditioning of aqueous radioactive waste is dictated by its activity and heat content, chemical and radio-chemical constituents, total dissolved solids, repository characteristics and economics. The authors detail the above conditions with particular reference to the management of a waste stream generated from reprocessing of low burn-up research reactor fuels. Details of the evaluation of different matrices, ranging from vitreous, bituminous, cement and polymer to composites, developed for this waste stream, selection criteria, repository characteristics and process features are presented. The results of analysis of the environmental impact of storage of this conditioned waste in the near-surface repository at Tarapur are discussed. (6 refs.)

70670 CEC research activities into the immobilization of volatile radionuclides from reprocessing. W.Hebel, G.Cottone (Comm. of the European Communities, Brussels, Belgium).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.245-51
Immobilization and storage of volatile radionuclides is part of the European Community's research programme in the area of radioactive waste management and storage. Since the first multiannual R&D Programme of Indirect Action, started in 1975, numerous research projects were and are being supported by means of contracts concluded with various organizations and companies in the member states. Among the volatile radionuclides particular attention is given to krypton-85, tritium, iodine-129 and carbon-14. As to krypton-85, the methods studied concern its incorporation into a metal matrix by ion sputtering, its locking up into zeolites and its filling into pressure bottles. For the latter, temporary storage in engineered structures on land and sea disposal have been evaluated. In addition, possible liquid metal embrittlement of structural and container materials by rubidium, the decay product of krypton, has been investigated. Concerning the immobilization of tritium, methods of fixation with calcium phosphates and as metal hydrides have been studied in connection with a preceding screening study on the subject. For iodine-129, a comprehensive study has been drawn up which gives a detailed state of the relevant management technologies, taking into account the radiological aspects. Regarding finally carbon-14, an assessment study has recently been taken up evaluating the state of knowledge and pointing out possible research requirements. (13 refs.)

70671 Development of processes for incorporation of radioactive waste in glass/metal compounds and ceramic materials. L.N.Lazarev, Yu.V.Kuznetsov, E.A.Shashukov, L.I.Krylov, A.G.Tutov, V.V.Dolgov, A.S.Aloi, P.G.Dobrygin, V.N.Romanovskii, A.S.Strel'nikov, V.V.Shorin.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.253-63 In Russian.
Gives the results of studies on incorporation of radioactive waste in glass-metal compounds and also in porous inorganic materials, which are thereafter converted into vitreous or ceramic products. (6 refs.)

70672 Practice followed at the Cadarache Nuclear Research Centre in the conditioning of solid radioactive wastes for purposes of temporary storage while awaiting disposal. J.Marcaillou, J.C.Faure (Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-lez-Durance, France), A.Bernard, J.C.Nomine.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.267-82
To ensure the safety of intermediate storage of solid radioactive wastes produced by the facilities at the Cadarache Centre, a system of pre-conditioning has been developed and put into practice. This system meets the following requirements: 1) reduction of volume in order to limit the area used at the Centre and the number of transport operations subsequently needed for disposal; 2) protection of the environment; and 3) the possibility of retrieval of packages for disposal (choice of packaging). The industrial techniques used and the results obtained at Cadarache for more than ten years are described and analysed. The cement/bitumen impregnating matrix injected into the container after compacting or—in the case of non-compressible wastes—after filling has been the subject of performance trials to determine its physical and mechanical properties. A full-scale leaching test is made on an 870-litre block consisting of real compacted and impregnated process wastes, the contamination of which is due mainly to plutonium and americium and to a lesser extent to caesium and cobalt. On the basis of analyses performed on the leaching agent, after 165 days the leaching test shows the impregnation to be generally satisfactory in performance. The plutonium released is found to be insignificant, the cumulative fraction of americium is in the region of 3.3×10^{-7} while the fraction of caesium released is 8×10^{-4}. (3 refs.)

70673 Long-term corrosion behaviour of metallic drums for low- and medium-level waste forms. W.Hauser, E.Smailos, R.Koster (Inst. fur Nukleare Entsorgungstech., Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.283-92
The potential release behaviour of radionuclides from the waste into the liquid phase in an event resulting from brine intrusion into a repository is determined by, among other factors, the quality of the waste package (waste form and packaging). In order to assess the importance of packaging, long-term corrosion tests (13 years) were performed on painted 200 L metallic drums in the Asse salt mine under various storage conditions. For the investigation of corrosion the familiar metallurgical methods were used (e.g., roughness measurements of the paint surface and of the steel bottom, metallographic examinations, etc.). The most significant results of these investigations can be summarized as follows: (1) At places where the paint had not been damaged prior to storage, corrosion attack was found neither on the coating nor on the basic material. (2) At places where the paint had been damaged down to the sheet metal on account of handling and in the contact areas of hoops and packaging material where the drums had not been painted, crevice and pitting corrosion was measured. Corrosion depths of about 30% to 50% at the maximum of the metal thickness were found in these areas. Further, the investigations demonstrated that the organic coating used provides good protection against the external corrosion of brines. The results were related to the time-dependence of the specific activity in typical LLW forms. (3 refs.)

70674 Development of a waste-containing unit for use in shallow-land burial. V.V.Larsen, K.Brodersen (Riso Nat. Lab., Roskilde, Denmark).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.293-303
The purpose of this investigation is to try to improve the safety of disposal of low- and medium-level radioactive waste in man-made constructions placed below ground but near the surface. A standard waste unit of hexagonal shape has been developed. Empty containers without lids are prefabricated from reinforced concrete. The waste is placed in the container—using remote control if necessary—and a lid is cast directly on top of the waste. The hexagonal shape was selected since it is suitable for an overpack container used for standard 210 L drums and since units can be placed together with very little space between them. This space is supposed to be filled with bitumen or concrete after placing the unit in the repository. One option under investigation in the study is to make the units of a new type of concrete called Densit, which has a much higher compression strength than ordinary concrete. The diffusivity for dissolved ions in the material is low, and the electrical resistivity is high. The material will therefore act as an additional barrier against migration of radioisotopes from the waste. More important, from a safety point of view, is that the disposal system as a whole is supposed to prevent contact between waste and water for a very long time. Preliminary results from laboratory investigations of the properties of the new material are reported. (2 refs.)

70675 Conditioning of low-level solid radioactive wastes for sea disposal at ECN, Petten. C.Koning (Netherlands Energy Res. Found., Petten, Netherlands).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.305-14
The radioactive wastes are collected from hospitals, universities, power stations and research centres in 100-litre steel drums. The drums are transported by a normal road-truck to the waste treatment facility at Petten. The steel drums with unsorted wastes are compacted by a high-pressure compaction facility with a total force of 1500 tonnes. The facility, including the storage of the 100-litre and 200-litre drums and the concrete mixer, is operated automatically by a minicomputer. In a 200-litre drum a layer of 10 cm concrete is poured on the bottom. In this layer reinforcement bars are fixed. The packets from a selection table are placed into the 200-litre drum to a maximum height of 64 cm. The packets are secured and centred by the bars. Concrete, with a compressive strength of about 40 N/mm^2 after twenty-eight days, is poured around the packets and on top of them. The concrete walls are 3.5 cm and the top is at least 10 cm thick. The data of the waste drums are collected by the minicomputer and on request one obtains the so-called dumping list with, for example, drum number, weight, radiation and activity per radionuclide. (3 refs.)

70676 Experience with the cementation of fluid waste. C.J.Lobbezoo (GKN Dodewaard, Dodewaard, Netherlands), F.Geevers, C.D.Andriesse.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.315-19
A discussion is given of practical problems with the cementation of fluid waste from a nuclear power plant. The fluids are slurries of precoat and resins, which are mixed with salt evaporator concentrate before adding cement. This mixing should result in homogeneous waste batches with a specific composition and gamma activity. The authors describe how this mixing is achieved within the specified parameters. After cementation the product is believed to be chemically stable and it is directly transportable as low-level waste. (1 ref.)

70677 Characterization of conditioned low- and intermediate-level wastes. D.Alexandre (Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-lez-Durance, France), A.Billon, J.Bourdrez, J.C.Nomine, C.de Tassigny, P.Pottier.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.323-45
All radioactive wastes must be conditioned to satisfy the criteria for disposal of them in the ground. In accordance with the specifications laid down by the Agence nationale pour la gestion des dechets radioactifs (French National Agency for Radioactive Waste Management—ANDRA), waste characterization records must be drawn up, with the relevant tests being carried out under approved conditions. The authors summarize the principal results acquired in laboratories of the French Atomic Energy Commission (CEA) under the characterization programme, which was initiated by ANDRA and to which the Commission of European Communities (CEC) has contributed within the framework of its five-year indirect-action programme (1980-84). The principal aspects of these characterization tests are concerned with leaching from normal-sized packages, techniques measuring the radioisotope diffusion rate in thermosetting resins, study of the chemical forms of the radioisotopes released and assessment of the resistance of the coatings to the action of micro-organisms in the soil. (8 refs.)

70678 An assessment of the role of testing and prediction of waste form performance for storage and disposal. P.Pottier (CEA, Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-lez-Durance, France), P.D.Johnston, E.Maestas.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.347-56
The objective of waste form evaluation is to ensure that reliable data are available to describe nuclear waste materials in safety, quality, acceptability and environmental analyses for transport, storage and disposal requirements. Although many test methods are routinely used for different purposes in the nuclear fuel cycle, there is a need for test methods to yield comparable data so that waste products can be uniformly classified or characterized. In the absence of international, or in some cases national, agreement on the methodology for particular tests it is often difficult if not impossible to compare the results obtained by different groups of workers even for similar waste/binder combinations. Recognizing this problem, the Nuclear Energy Agency of the Organisation for Economic Co-operation and Development convened a group of technical experts from its member countries to examine the present status of the methodologies and rationale for radioactive waste form evaluation and testing. The authors describe the results of this workshop. (no refs.)

70679 Investigation of activity release from bituminized intermediate-level waste forms under thermal stresses. W.Kluger, P.Vejmelka, R.Koster (Inst. fur Nukleare Entsorgungstech., Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.357-66
To detemine the consequences of a fire during fabrication, intermediate storage and transport of bituminized $NaNO_3$ waste forms, the fractions of plutonium released from the waste forms were assessed. For this purpose, laboratory tests were made with PuO_2-containing specimens as well as a field test with specimens containing Eu_2O_3. By the evaluation of plutonium release in the laboratory and by the determination of the total sodium release and the relative Eu/Na release in the field tests the plutonium release can be deduced from full-scale specimens. (4 refs.)

70680 A study of certain properties of bitumen compounds which determine the conditions for their storage. M.I.Zhikharev, K.P.Zakharova, A.S.Polyakov, I.A.Sobolov.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.367-73 In Russian.
The extent to which solidified radioactive waste is securely isolated in a repository is determined by the hydrogeological conditions at the site, the impermeability to water of the engineered barriers and the properties of the waste being stored. The main causes of radionuclide migration may include inadequate impermeability, explosion, fire or changes in the properties of the materials during storage. Radiation or microbiological processes may give rise to changes in the properties of the compounds. The authors give the results of a study of the biological stability of bitumen compounds, the risk of explosion of bitumen compounds in storage, the fire hazard associated with the production and storage of bitumen compounds, and the possibility of extinguishing fires. (no refs.)

70681 The development and evaluation of SYNROC for high-level radioactive waste immobilization. K.D.Reeve, D.M.Levins, E.J.Ramm, J.L.Woolfrey (Australian Atomic Energy Comm. Res. Establ., Sutherland, NSW, Australia).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.375-90
The current status of SYNROC evaluation and development by the Australian Atomic Energy Commission is reviewed. The methods used for the evaluation of leach, irradiation, thermal and mechanical stability of SYNROC are described. A range of tests shown that SYNROC is more leach resistant than borosilicate glasses over the temperature range 45-300°C. Because of its excellent stability under hydrothermal leach conditions at 300°C, SYNROC could be used to immobilize and dispose of high-level waste without long periods of engineered storage likely to be necessary for borosilicate waste glass. Accelerated radiation damage testing using fast neutrons has simulated storage times of up to 9×10^5 years. The results indicate that actinide decay damage is unlikely to cause deleterious effects in SYNROC for at least 2×10^5 years and, even after much longer times, no great increase in leach rate is expected. SYNROC has been fabricated on a 30 kg scale using 'in-can hot-pressing'. Candidate processes are being evaluated for inclusion in a proposed engineered pilot plant for SYNROC fabrication. (18 refs.)

70682 Quality control of radioactive wastes. E.Warnecke, P.Brennecke (Phys.-Tech. Bundesanstalt, Brunswick, Germany), G.G.Eigenwillig, F.Heil.
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.391-404
The Physikalisch-Technische Bundesanstalt (PTB) is responsible for the disposal of radioactive waste in the Federal Republic of Germany and must prove that the waste packages comply with the disposal requirements. A quality assurance programme for radioactive waste is therefore being carried out. The quality assurance of radioactive waste can in principle be carried out by an adequate programme within the conditioning process (system-oriented control programme) or by a control of the waste packages with non-destructive or destructive test methods (product-orientated control programme). The main features of a system-orientated control programme for waste packages are described as well as the status of the development of product-orientated controls. In a first theoretical analysis, graduated control requirements for waste packages are evaluated according to their radiological importance. The development of an organization and documentation system completes the quality assurance programme. (9 refs.)

70683 Treatment, storage and disposal of low- and intermediate-level reactor wastes at Olkiluoto Power Plant. H.Harkonen, P.Lehtinen, A.Ruuskanen (TVO Power Co., Espoo, Finland).
Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.407-18
Low- and intermediate-level waste is continuously produced during operation of a nuclear power plant. Reactor waste management can generally be divided into three main stages: conditioning, storage and disposal. At Olkiluoto Power Plant intermediate-level liquid waste is solidified by incorporation into a bitumen. Compressible dry waste is compacted into 200 L steel drums. At present, all reactor waste produced is stored in the waste buildings of the plant units. A separate storage building for low-level waste is under construction and design of a storage facility for bituminized waste has been started. A great number of geological and hydrogeological investigations have been

performed to assess the suitability of the bedrock at the power plant site for the disposal of low- and intermediate-level waste. As a part of this assessment, a preliminary design of an undergound repository has been performed. Safety assessments indicate clearly that all low- and intermediate-level waste from the operation and decommissioning of Olkiluoto Power Plant can be stored and disposed of in a safe way. Consequently, current conditioning practices are considered fully adequate for storage and disposal. (no refs.)

70684 The role of waste conditioning as regards the safety of low-and intermediate-level waste disposal. E.Peltonen, S.Vuori, M.Katka (Nuclear Engng. Lab., Tech. Res. Centre of Finland, Helsinki, Finland).

Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.419-35

The authors clarify the role of conditioning of low- and intermediate-level wastes from the operation and decommissioning of LWR plants as regards the safety of the final disposal. The assessment of the conditioning requirements is based on the results of the recent studies comprising the safety analysis of a site-specific disposal system. The repository is expected to be situated on a coast in hard Precambrian bedrock below the groundwater table. Owing to the geological characteristics of the disposal site the discharge of the radionuclides to biosphere can occur only through the groundwater. The conditioning requirements are very dependent on the disposal system and the criteria employed. (7 refs.)

70685 Drafting of French regulations on the conditioning and intermediate storage of radioactive wastes from irradiated-fuel reprocessing plants. F.Habib (Ministere de la Recherche et de l'Industrie, Fontenay-aux-Roses, France).

Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.437-44 In French.

Specifications for the wastes to be produced by future plants reprocessing fuel irradiated in pressurized-water reactors—plants which will constitute extensions to the La Hague establishment—must be approved by the French safety authorities. With a view to defining the conditions of this approval, the latter have drafted regulatory documents known as 'fundamental safety requirements' for the production, monitoring, conditioning and intermediate storage of solid wastes from the reprocessing of these fuels. These regulations take the form of a general requirement applicable to all types of waste and specific requirements which depend on the type of waste and the method of conditioning. Particular attention is given in this paper to the general requirement and to the requirement for high-level wastes solidified in the form of glass. (no refs.)

70686 Considerations for waste conditioning associated with near-field phenomena and geochemical processes in a geological disposal environment. P.D.Johnston (OECD Nuclear Energy Agency, Paris, France).

Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.445-59

During 1981 and 1982, the NEA Co-ordinating Group on Geological Disposal sponsored two workshops: one on near-field phenomena in geologic repositories for radioactive waste, held in Seattle, USA, in September 1981; and the second on geochemistry and radioactive waste disposal, held at the QECD in Paris in May 1982. Material presented and discussed at these meetings has been reviewed and assessed to identify to what extent the phenomena of importance necessitate particular consideration in waste conditioning. The emphasis is on high-level wastes, although similar considerations may be relevant for other radioactive wastes disposed of in a geological environment. (4 refs.)

70687 An alternative strategy for commercial high-level radioactive waste management. C.J.Northrup (Sandia Nat. Labs., Albuquerque, NM, USA), L.J.Jardine, M.J.Steindler.

Conditioning of Radioactive Wastes for Storage and Disposal. Proceedings of an International Symposium, Utrecht, Netherlands, 21-25 June 1982 (Vienna, Austria: IAEA 1983), p.461-75

Discusses an assessment of benefits that could be realized from separating ^{90}Sr and ^{137}Cs from HLW and handling them separately from the bulk of the remaining solidified HLW. It is noted that treatment of the caesium and strontium separately may result in economic advantages in the waste management system and substantially improves the reliability of the performance of the waste package. (21 refs.)

70688 Materials available and the present state of research into the basis for the design of high temperature components for HTR-plants. H.Nickel, F.Schubert, H.-J.Penkalla, H.H.Over (Inst. fur Reaktorwerkstoffe, Kernforschungsanlage Julich GmbH, Germany).

8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.1/1-26 In German.

Current research has reached the stage when firm statements regarding qualities of Inconel 617 and Hastelloy X with respect to their use in HTR plant can confidently be made. The chemical composition of the above mentioned metals and that of Incoloy 800H and the basic operating data of the He/He-heat exchangers are listed. The operating conditions and construction features are discussed. Analysis of the test results were used to check on ASME-Code Case N47. The effect of contaminated HTR-Helium on the properties of the structural material at 900 deg.C and over is discussed. Fatigue, creep, ratchet-creep are described and graphically presented. (16 refs.) *G.R.S.*

70689 Description of the properties of 10CrMoNiNb910. M.Dette, H.Hahn (RWTUV, Essen, Germany), H.C.D.Nieuwland, J.W.Tichler.

8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.3/1-30 In German.

This material has been used in the construction of the steam generator of the sodium fast breeder reactor plant SNR-300. All sodium carrying parts of the plant are made of austenitic X6CrNi18 11, but because of the high conductivity the steam generating plant components were made of ferritic 10CrMoNiNb910. Drawings of straight pipe heat generator curves showing carburization properties of austenitic steels in contact with various ferritic steels at 600 deg.C and decarburization of ferritic steels 10 CrMoNiNb.910 in the system ferrite-Na-austenite and microphotographs of the initial and final stages of crystallization are given. Solubility of NbC in iron, hardness vs. temperature, resistance to heat, tension and compression vs. temperature are graphically described. (36 refs.) *G.R.S.*

70690 Nondestructive analysis of the structure of pressure vessel steels by micromagnetic testing techniques. W.A.Theiner, B.Reimringer (Inst. fur Zerstorungsfreie Prufverfahren, Univ. Saarbrucken, Saarbrucken, Germany), P.Deimel, D.Kuppler.

8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.6/1-25 In German.

The methods used in the nondestructive tests described are based on acoustics and magnetism. The materials tested were 22NiMoCr37, X20CrMoV121, X20Cr13 at 610 deg.C. The characteristics of the microstructure of the types of crystals formed, such as 100% martensite, 70% martensite 30% bainite, 100% bainite are given. Stretch limits vs. annealing time at 610 deg.C for 22 NiMoCr37 and hysteresis curves are shown. (10 refs.) *G.R.S.*

70691 Recording length-criteria used for ultrasonic testing. E.Fischer, M.Kroning, H.Schober, H.Fischdick (Kraftwerk Union AG, Erlangen, Germany).

8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.8/1-14 In German.

Ultrasonic tests for integrity of structural materials though generally applicable, falls short in some cases of complete reliability, hence the requirement for a more universal signal. The concept of length-criteria based on ultrasonic tests has been suggested. The experimental facility and the tests carried out are described. For structural difficulties it has been recommended that holography should be used to complement ultrasonic test methods. (8 refs.) *G.R.S.*

70692 Improvement of ultrasound testing by the installation of electronically controlled test equipment (phased arrays). W.Gebhardt (Fraunhofer-Inst. Furzerstorungsfreie Prufverfahren, Saarbrucken, Germany).

8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.9/1-17 In German.

Phase-array aerials have been in use for a number of years in radar techniques. The principle consists of using a number of rays that can be individually electronically controlled, thus affording a flexible sonic formation and enabling longitudinal, transverse and surface surveys to be made. The three types of array: ring, linear and matrix are described and a block diagram of the array system is given. (6 refs.) *G.R.S.*

70693 Acoustic emission measurements on large specimens in the research program into component safety (FKS). J.Eisenblatter (Battelle-Inst. e.v., Frankfurt am Main, Germany), P.Runow.

Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.10/1-20 In German.

Sound emission methods have been successfully used in nuclear reactors to detect structural failures, but so far they have been unable to discriminate between large and small cracks and were not reliable in cases of incipient failures. The work described aimed at improving the method and to that end tests have been carried out on large steel specimens with a variety of defects such as plastic deformation, microcracks, crack growth, friction etc. (no refs.) *G.R.S.*

8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.12/1-21 In German.

It has been found that to secure a reliable assessment of mechanical strength and long time service of nuclear plant components it is desirable to subject them to breaking stress and plastic deformation tests. The theoretical basis of the plastic deformation limits are discussed and mathematically described. The plastic flow limits can be determined quantitatively from the temperature and deformation rates, but a reliable estimate can only be obtained for low temperatures. (16 refs.) *G.R.S.*

8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.13/1-20 In German.

By the use of the partial load reduction method it was possible to produce high accuracy crack resistance curves at reactor temperature operating range. The experimental method of determination of the J-crack resistance curve and the crack growth is described. The deformation, expansion and stresses caused by the crack are discussed and a numerical analysis of the geometry is made. The steels used in the experiments were C25 A542 at 25 deg.C and C50 20MnMoNi55 (A533) at 285 deg.C. (19 refs.) *G.R.S.*

70696 Fracture analysis of a pressure vessel with a semi-elliptical surface-crack by three-dimensional elastic-plastic finite element calculation. D.Aurich, W.Brocks, D.Noack, H.Veith (Bundesanstalt fur Materialprufung, Berlin, Germany).

8. MPA-Seminar. Fracture Behaviour and Nondestructive Testing. Safety of the Pressure Boundary of Light Water Reactors. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.14/1-34 In German.

Elastic analysis taking into account 'small scale yielding' corrections for even stresses can be used for estimation of load limits. This concept has been applied to the investigation in the case of a cylindrical pressure vessel having two deep semi-elliptical cracks ($a/t=0.59$). The three dimensional elastic-plastic stress distortion analysis using the method of finite elements produced results showing stress distribution, plastic zones and crack starting profiles resulting from inner pressure. The results are discussed and it has been shown that for an ASME-code assumed K_{Ic}-value of $6900 N/mm^{-3}$ at an operating temperature of 314K the critical pressure is 280 bar. Materials for Advanced Reactor Systems, Stuttgart, Germany, 14-15 Oct. 1982 (Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982), p.19/1-14 In German.
Three steels 22NiMoCr37, 15MnNi63 and St 52-3 were used in tests to determine the effect of the rate of loading and charge duration at constant load on the toughness of the specimens. (9 refs.) *G.R.S.*

70698 The study of the interaction of the components of imitator-glasses of glassified radioactive wastes with various surrounding rocks. V.I.Spitsyn, A.A.Minaev, L.I.Barsova, P.Ya.Glazunov (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.9-14
This is one of the first attempts to work out a proper technique for the determination of the diffusion of the phosphate glass components into various rocks by using X-ray microanalysis. Under study was thermal and radiation-enhanced diffusion of phosphorus, chromium from phosphate glasses into the samples of basalt, metagabbro, metadunite and quartz at high temperatures (to 600°) during gamma irradiation, and radiation enhanced diffusion of ions into rocks. (5 refs.)

70699 Evaluation of ceramic materials to immobilize ICPP calcines. B.A.Staples, H.S.Cole, J.C.Mittl (Exxon Nuclear Idaho Co. Inc., Idaho Falls, ID, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.37-48
Various ceramic materials as well as Formula 127 glass have been developed to immobilize Idaho Chemical Processing Plant (ICPP) zirconia calcine. Tailored, titanate and matrix encapsulated ceramics were prepared by cold pressing and sintering reactants, while glass-ceramics were prepared by melting in a manner similar to that of preparing the glass. X-ray diffraction techniques were used to determine the presence of radionuclide and calcine matrix element host phases in each ceramic material. The aqueous leachability, practical loading capacity and the incorporation of waste elements into host phases was investigated and compared to those of Formula 127 glass through application of the Soxhlet and MCC-1 static leach tests. Potential process requirements for each material were evaluated based on the number of steps needed for laboratory-scale preparation. (9 refs.)

70700 Development of sphene-based glass ceramics tailored for Canadian waste disposal conditions. P.J.Hayward, E.V.Cecchetto (Whiteshell Nuclear Res. Establ., AECL, Pinawa, Manitoba, Canada).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.91-8
Glass ceramics and ceramics based on minerals of proven thermodynamic stability in Canadian Shield groundwaters are being developed to host the wastes arising from future CANDU fuel recycling. Sphene-based glass ceramics, produced by melting Na_2O-CaO-Al_2O_3-TiO_2-SiO_2 compositions at 1400°C, cooling, and then reheating the phase-separated glasses to approximately 1000°C, show strong partitioning of waste ions into the sphene ($CaTiSiO_5$) lattice. Leaching results suggest that these materials are durable in deionized water. In simulated groundwaters, the sphene phase appears to suffer no net leaching. Leach testing and manufacturing methods are discussed. (12 refs.)

70701 The leaching behaviour of the Swedish KBS-glasses ABS 39 and ABS 41. H.-P.Hermansson (Studsvik Energiteknik AB, Nykoping, Sweden), H.Christensen, L.Werme, K.Ollila, R.Lundqwist.
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.107-14
The planned Swedish KBS glass corrosion investigation program comprises experiments with inactive glasses containing simulated waste, prolonged in-situ tests, the characterization of corrosion products, immiscibility studies, and corrosion experiments with 'hot glass'. The authors give a short description of the entire program. They focus thereafter on some recent leaching results with the inactive KBS glass qualities ABS 39 and ABS 41, which were leached in a manner similar to the PNL MCC-1 test procedure. (3 refs.)

70702 Respirable fines produced by impacts of simulated alternative high-level waste materials. L.J.Jardine, G.T.Reedy, W.J.Mecham (Argonne Nat. Lab., Argonne, IL, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.115-23
Standardized comparative drop weight impact tests were conducted on solid alternative waste forms under consideration for immobilizing Savannah River Laboratory defense wastes. The fragment size distributions were measured in the size ranges of ~5 to 8000 μm. All waste form fragment size distributions could be described accurately by lognormal plots. Respirable sizes (≤ 10 μm) were measured. Borosilicate glass and SYNROC specimens yielded the same mass fractions of respirable sizes; FUETAP concrete, high silica and alkoxide glass specimens yielded ~2-3 times more mass fractions of particles of respirable sizes, whereas tailored (Spinel) ceramic specimens yielded the smallest mass fractions of respirable sizes, ~2-1/2 times less. (3 refs.)

70703 A methodology for characterizing brittle fracture of solid waste forms in accidental impacts. W.J.Mecham, L.J.Jardine, M.J.Steindler (Argonne Nat. Lab., Argonne, IL, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.125-31
A general method for characterizing the major practical effects of accidental impacts on waste packages and for evaluation of scale-model tests has been partially developed. Impact fracture of brittle waste forms has been shown elsewhere to produce particulates whose size distributions are described by the lognormal probability distribution. The model proposed for fragment generation involves the transformation of impact (kinetic) energy into elastic strain energy which is followed by fracture and energy dissipation into heat by the fracture particulates. The peak stresses developing during compressions are approximated as a function of time using elastic theory for a wide range of practical impact conditions for typical (glass) waste forms. The proposed methodology requires experimental validation in terms of correlation of stress and energy parameters with particulate parameters describing the results of fracture. Two kinds of preliminary correlations are presented: (1) calculations of stress parameters for a range of impact conditions of stress parameters for a range of impact conditions; and (2) averages of particulate parameters obtained in standard impact tests. (12 refs.)

70704 Alkoxide derived amorphous solids as an alternate nuclear waste form. J.M.Pope, D.E.Harrison (Westinghouse Res. & Dev. Center, Pittsburgh, PA, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.133-9
Nitric acid waste can be immobilized in an amorphous aluminosilicate matrix that is produced by polymerization of metal alkoxides. Unlike vitreous aluminosilicate host matrices obtained by melting, neither alkalis, alkaline earths, nor borates are required since no melting is involved. Instead, the alkoxide glass formers and radionuclides react directly to form a randomly cross-linked structure of silica and alumina polyhedra. Structurally, the amorphous product formed through chemical polymerization is similar to a true glass except that it has not experienced melting. As a result, neither a glass transition temperature nor a specific volume temperature dependence would be expected in such an amorphous material. As a chemically durable waste form, the 'gel-glass' product should be substantially better than ordinary waste glass because it can be made without the addition of either alkalis or boron. (4 refs.)

70705 Solubility effects in waste glass/demineralized water systems. H.T.Fullam (Pacific Northwest Lab., Richland, WA, USA).
Scientific Basis for Nuclear Waste Management. Proceedings of the Fourth International Symposium on the Scientific Basis for Nuclear Waste Management, Boston, MA, USA, 16-19 Nov. 1981 (New York, USA: North-Holland 1982), p.173-80
A study was carried out to determine the solubility limits of various elements found in waste glasses in demineralized water as a function of temperature. The work was sponsored by the Office of Nuclear Waste Isolation under contract to the Department of Energy. Solubility measurements were carried out at 35°, 65°, 95°, and 150°C using three nonradioactive waste glass compositions. Subsaturation and supersaturation methods were used to determine the solubility limits. The two methods gave markedly different values for most glass components. The results obtained indicate that it is difficult to assign solubility limits to most glass components without thoroughly describing the glass-water system. This includes not only defining the glass type, and system temperature, but also the glass surface area-to-water volume (S/V) ratio of the system and its thermal history. (1 ref.)

28.42H Fuel preparation and reprocessing

(inc. isotope separation and enrichment)

70706 Fuel streams in closed-cycle light water reactors. J.Clauss.
Atomwirtsch.-Atomtech. (Germany), vol.28, no.5, p.259-62 (May 1983). In German.
The article deals with the streams of materials occurring in a closed fuel cycle on the basis of the parameters associated with light water reactors and certain recycling strategies. (2 refs.)

70707 Progress report on the uranium-enrichment process via chemical exchange. C.Bernaud, J.-H.Coates, M.Gelee, J.-M.Lerat, P.Plurien (Div. d'Etudes de Separation Isotopique, CEA, Paris, France).
Rev. Gen. Nucl. (France), no.1, p.49-52 (Jan.-Feb. 1983). In French.
Five years ago, during the Salzburg Conference set up by AIEA, the French Atomic Energy Commission disclosed the existence of a new uranium isotopic enrichment process via chemical exchange. This process provided a high enrichment coefficient, its power consumption was low and its use entailed

only conventional chemical industry processes. Other details were disclosed later on: the exchange takes place through two liquid phases, one aqueous, the other organic, brought to interact in large-size pulsed columns. These columns are arranged in series so as to obtain enrichment cascades, connected to one another according to an original layout enabling the design of modular industrial assemblies adaptable according to market requirements. The progress achieved since the Salzburg announcement is remarkable. For instance, the separation power delivered yearly per cubic metre has trebled. Thus, the absolute value of the cost per Separation Work Unit has been markedly lowered and the cost-effectiveness of the process is now broadly confirmed, particularly in the case of small-size plants. The authors present the characteristics of this process which, while remaining unsuited to proliferation, is one of the most interesting among all those developed so far. (16 refs.)

28.43 FISSION REACTOR OPERATION

70708 An evaluation of approximate methods for calculating anisotropic flux escape and transmission probabilities for cylindrical annular regions. P.D.Krishnani (Theoretical Reactor Phys. Section, Bhabha Atomic Res. Centre, Bombay, India).
Ann. Nucl. Energy (GB), vol.10, no.6, p.285-97 (1983).
In the interface current method for solving the integral transport equation, most of the computer time is spent in the precalculation of various region transmission, escape and collision probabilities. Therefore, any reduction in computer time used to calculate these probabilities will directly affect the efficiency of this method. The normal methods such as the Trapezoidal rule or Gauss-quadrature formula for calculating the various probabilities require the evaluation of many Bickley functions per integral, which is time consuming. The author discusses efficient methods for calculating the various probabilities corresponding to anisotropic terms of the angular flux expansion at region interfaces for cylindrical annular geometry. The author first discusses the application of Bonalumi's Pseudo-Linear approximation and the second-order correction to it which requires the evaluation of one and two Bickley functions, respectively, per integral. The author then discusses a Guass quadrature formula with exponential weighting and its modified form. (8 refs.)

70709 Modification of the PWR control system using a gaseous absorber. Y.Ronen, A.Galperin (Dept. of Nuclear Engng., Ben-Gurion Univ. of the Negev, Beer Sheva, Israel).
Ann. Nucl. Energy (GB), vol.10, no.6, p.331-3 (1983).
A modification of the PWR control system is suggested, based on the introduction of a gaseous absorber to the core thimbles. The absorber under consideration is ^{3}He. The advantage of the suggested method is the possibility of controlling the reactor during burnup without affecting the moderator reactivity coefficient, and without distorting the reactor axial power distribution. The suggested method also provides a redundancy of the control system. Initial calculations corresponding to this modified control system are presented, while its advantages and disadvantages are discussed. (1 ref.)

70710 Supervisory control of Belgium's nuclear power.
Comput. Syst. (GB), vol.3, no.5, p.15-28 (May 1983).
Explains how dual Gould SEL computers are providing supervisory control at the Belgian nuclear power complex at Doel on the banks of the Scheldt near Antwerp. (no refs.)

70711 Test facility for auxiliary cooling system (ACS) of fast breeder reactor for Power Reactor & Nuclear Fuel Development Corporation (PNC).
Ishikawajima-Harima Eng. Rev. (Japan), vol.23, no.1, p.44-50 (Jan. 1983). In Japanese.
The auxiliary cooling system is an important engineered safety feature, and is used for safe removal of heat from the reactor at the shutdown. The ACS serves as a means of testing and assessing the auxiliary cooling system for the 'Monju' and is designed and manufactured to have one fifth capacity of the Monju. The air heat exchanger and the ACS system was designed to withstand the higher temperature range of the conventional design code (MITI-501), and finned tubes were applied for effective heat removal. A preheating system was designed to heat up the whole system over 200°C within 20 hours to prevent sodium from freezing. Basic performance of ACS was verified satisfactorily by a series of performance tests, such as start up test, flow rate measurement and preheating test before delivery. The experience from designing and construction of ACS and data obtained by these tests will be very instructive for designing and construction of the 'Monju' prototype FBR. (3 refs.)

70712 Equation of equilibrium emission and retardation parameters in nuclear-power-plant turbines with dissociating nitrogen tetroxide. E.A.Orudzhaliev (M. Azizbekov Azerbaidzhan Inst. of Petroleum & Chem., Baku, Azerbaidzhan SSR).
J. Eng. Phys. (USA), vol.43, no.2, p.846-52 (Aug. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.2, p.201-9 (Aug. 1982). [received: April 1983]
The equation of emission, retardation parameters, and expressions for quantities at the flow crisis are obtained for the case of dissociating nitrogen tetroxide. (3 refs.)

70713 ZED-2 experiments on the effect of a Co absorber rod on an NRU loop. G.M.Arbique, P.M.French.
Report AECL-7515, Atomic Energy Canada Ltd., Chalk River, Ont. (Feb. 1983), vi+44 pp.
A series of experiments has been performed in ZED-2 to measure the perturbing effects of an NRU cobalt absorber rod on a simulated NRU loop site containing graded enrichment UO_2 fuel. The objective of the measurements was to provide data useful in validating NRU reactor physics codes. Using a simulated NRU lattice containing a simulated NRU loop site and an asymmetrically placed Co absorber rod, measurements were made of: (a) reactivity effects, as measured by critical height changes, associated with voiding the loop and stepped insertion of the Co absorber rod; (b) flux perturbations at the simulated loop site and throughout the lattice induced by the Co rod; (c) Westcott $r\sqrt{T/T_0}$ values throughout the lattice. (5 refs.)

70714 A new fast neutron scattering technique for local void fraction measurement in two-phase flow. E.Hussein, S.Banerjee, D.A.Meneley (Dept. of Engng. Phys., McMaster Univ., Hamilton, Ontario, Canada).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.1431-42 vol.2
A new non-intrusive fast neutron scattering technique for local void fraction distribution in two-phase flow is presented. The theory upon which the technique is based is discussed, illustrating the capabilities and limitations of the technique. Single scattering of neutrons is formulated into a set of non-linear equations relating the local void fraction distribution to measured neutron fluences at different energies and angles of scattering. The inverse problem of solving these equations to reconstruct phase distribution is explained and demonstrated with examples. The techniques for measuring the fluence and energy of the scattered neutrons are outlined, and experimental measurements are shown. Simulations of the measurements are compared with actual data. (18 refs.)

28.44 FISSION REACTOR PROTECTION SYSTEMS, SAFETY AND ACCIDENTS

70715 Monte Carlo simulation of the emergency shutdown system for the high-temperature pebble-bed nuclear reactor. L.Bieniasz, J.Moscinski, P.Nizegorodcew, Z.Rycerz (Inst. of Computer Sci. AGH, Cracow, Poland).
Ann. Nucl. Energy (GB), vol.10, no.6, p.299-303 (1983).
A theoretical model of the emergency shutdown system for the high-temperature pebble-bed nuclear reactor is presented. The stochastic trajectory of an absorbent ball has been described as a fall with 'absorption' along the vertical axis and with planar diffusion in the horizontal directions. Small samples of the random packing of hard spheres and the absorbent balls' trajectories in them have been simulated by the direct Monte Carlo method. The values of model parameters have been estimated from the simulated distributions of the absorbent balls' displacement vectors. The estimated values agree qualitatively with experimental data. (7 refs.)

70716 PWR nozzle 'crotch corner' inspection: an effective additional ultrasonic technique for radial cracks. J.M.Coffey, J.M.Wrigley (NDT Applications Centre, CEGB, Manchester, England).
Br. J. Non-Destr. Test. (GB), vol.25, no.3, p.130-1 (May 1983).
A description is given of an ultrasonic inspection technique for the detection of cracks in PWR inlet nozzle crotch corners. The beam reflection geometry is illustrated. Experimental verification of the technique is obtained using a test block. The application of the technique to automated inspection of PWR nozzles is outlined. (4 refs.)

70717 Containment vessel design and practice. Y.Bangash (Div. of Structures, School of Civil Engng., Thames Polytech., London, England).
Prog. Nucl. Energy (GB), vol.11, no.2, p.107-81 (1983).
Attempts to review the state of the art of methods of analysis and design of the concrete containment vessels required for BWR and PWR. A step-by-step critical appraisal of the existing work is given. Elastic, inelastic and cracking conditions under extreme loads are fully discussed. Problems associated with these structures are highlighted. A three-dimensional finite element analysis given by the author is included to cater for service, overload and dynamic cracking of such structures. Missile impact and seismic effects are included in this work. The second analysis is known as the limit state analysis, which is given to design such vessels for any kind of load. Two existing vessels in reinforced and pre-stessed concrete are examined. Substantial calculations are given in order to assess their behaviour. Both these original analyses were developed by the author and are given in the appendices. They have been fully tested on four other vessels and two models. Due to limitations of space, some of these details could not be revealed. A brief explanation is given regarding the computer programs supporting the above analysis. (164 refs.)

70718 Radiation influence on the surroundings in the case of accidential gaseous releases in nuclear power plant. J.Curkovic.
Energija (Yugoslavia), vol.32, no.2, p.89-101 (1983).
Describes methods for estimation of exclusive zone radius and zone of low populations as well as minimal distance to city with more than 2500 inhabitants. For estimation of distances, several presumptions that are included in the AKCDOZ computer program are used. (15 refs.)

70719 Evaluation of fuel performance in reactor (PWR). V. Special behavior caused by cladding defect. T.Aoki (Kansai Electric Power Co., Osaka, Japan).
J. At. Energy Soc. Jpn. (Japan), vol.25, no.2, p.102-7 (Feb. 1983). In Japanese.
For pt.IV see ibid., vol.24, p.29 (1983). Treats the extreme cases, in which recoil and knockout phenomena of fission products from fuel pellets, and surface contamination due to ejected UO_2 may cause abnormal contamination of the primary coolant accompanied by enlargement of the crack in the cladding. For these cases, the transient behavior of iodine concentrations of ^{131}I, ^{133}I and ^{135}I in the primary coolant are analyzed, and variations of relations between ratios of $^{131}I/^{133}I$ and $^{135}I/^{133}I$ are explained. These most unfavorable defects of fuel cladding should be caught by the reactor operator so as to take a suitable and prompt action. The above analysis offers much information to judge the phenomena occurring in the reactors. (18 refs.)

70720 Transient fission product release during dryout in operating UO_2 fuel. I.J.Hastings, C.E.L.Hunt, J.J.Lipsett, R.G.Gray.
Report AECL-7832, Atomic Energy Canada Ltd., Chalk River, Ont. (Dec. 1982), 13 pp.
The authors have irradiated an instrumented stainless-steel-clad UO_2 fuel element, with upper and lower gas lines attached, at a linear power of about 55 kW/m to about 80 MW.h/kg U. During normal operation, fuel central, peripheral and sheath temperatures were about 1700, 800 and 300°C, respectively. During three transients initiated during the test, the corresponding ranges of temperatures were 2000-2300, 1100-1400 and 500-700°C, for dryout times up to 40 min. During normal and transient operation, short-lived xenons and kryptons were swept from the element by a carrier gas and measured by gamma-ray spectrometry. During the most severe transient, fission product release was about 1.8% of inventory, with maximum release during re-wet and a concurrent reactor trip. Despite the thermal shock, the fuel pellets maintained reasonable integrity. No iodines were measured at the spectrometer during normal or transient operation. (16 refs.)

70721 Updating of the plant protection system on the Prototype Fast Reactor Dounreay. D.Hodgson, N.T.C.McAffer (Risley Nuclear Power Dev. Establ., UKAEA, Risley, England).
Colloquium on 'Updating the Control Systems of Existing Plant to Incorporate Microprocessor Technology', London, England, 25 March 1983 (London, England: IEE 1983), p.4/1-6
The Secondary Circuit Interlocks provide control, protection, tripping and inter-tripping of the secondary sodium circuits, the steam generator units, the turbine and feed train, as an operating system. Additional protection such as over current, over temperature, over speed is provided locally for each of the major units. The paper describes the changes and consequences involved in converting the original electro-magnetic relay logic system to a new system based on programmable logic controllers. (2 refs.)

28.50 FISSION REACTOR TYPES AND APPLICATIONS

70722 CANDU with hydrogen. M.Hammerli (Chalk River Nuclear Labs., Atomic Energy of Canada Ltd., Chalk River, Ontario, Canada).
Int. J. Hydrogen Energy (GB), vol.8, no.4, p.269-80 (1983).
How Canada's successful CANDU (CANada Deuterium Uranium) nuclear power reactors would benefit from an emerging hydrogen-electric economy and vice versa is discussed with reference to the Combined Electrolysis Catalytic Exchange (CECE) process for recovering byproduct heavy water from electrolytic hydrogen. At the heart of this process is a hydrophobic, dispersed-platinum catalyst which has been under development at Chalk River for about a decade. Other potential applications of the CECE process are presented, including tritium recovery from both light and heavy water. Based on preliminary data and cost estimates, the net heavy water dollar credit appears to be at least comparable to the byproduct oxygen credit of electrolytic hydrogen. The potential for byproduct heavy water production from hydrogen in general, and from electroytic hydrogen in particular, is discussed in relation to Canada's present primary heavy water production capacity. (22 refs.)

70723 First nuclear reactor as seen from forty years' perspective. C.A.Dabrowski (Instytut Badan Jadrowych Swierk, Poland).
Przegl. Elektrotech. (Poland), vol.58, no.11-12, p.365-72 (Nov.-Dec. 1982). In Polish.
The most important events in nuclear physics development are presented, which led to the discovery of the feasibility of the nuclear chain reaction on uranium and then to its materialization in the first nuclear reactor commissioned on the 2 Dec. 1942 in Chicago. The three periods in reactor technology development are characterized—development of reactor technology by nuclear powers for military purposes; development of research and experimental reactors; and development of power reactors especially those moderated by graphite. Information on the research and feasibility work of the first Polish natural uranium-graphite power reactors is also given. (28 refs.)

28.52 FUSION REACTORS

(for confinement, see 52.55)

70724 The JET scientific programme and perspectives in the European fusion programme. R.J.Bickerton (JET Joint Undertaking, Abingdon, England).
Phys. Scr. (Sweden), vol.T2, no.2, p.347-52 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).
The JET scientific programme is aimed at the achievement of a deuterium-tritium plasma with parameters close to those evisaged for a fusion reactor. The programme is paced and largely determined by the gradual build-up over four years of the additional heating power into the plasma. The present expectation is that it will be possible to reach conditions where the thermonuclear power in alpha particles makes a significant contribution to the energy balance in the core of the JET plasma. The JET experiment is placed in the context of the European fusion programme and the desiderata and time scales for a large post-JET tritium-burning Tokamak (Next European Torus, NET) are deduced. (9 refs.)

70725 Physics requirements for a Tokamak Engineering Test Reactor. D.Duchs (Max-Planck-Inst. fur Plasmaphys., Garching, Germany), F.Engelmann.
Phys. Scr. (Sweden), vol.T2, no.2, p.353-8 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).
The physics requirements of a Tokamak Engineering Test Reactor, considered as the step following the generation of large Tokamaks presently under construction in developing a fusion reactor, are concisely stated and discussed, using as starting point the analysis of the INTOR Workshop. (4 refs.)

28.80 RADIATION TECHNOLOGY, INCLUDING SHIELDING

(see also 87.60 Medical and biomedical uses of fields, radiations and radioactivity)

70726 Radiation and risk. W.Jacobi.
Atomwirtsch.-Atomtech. (Germany), vol.28, no.5, p.238-48 (May 1983). In German.
From the beginnings of the peaceful utilization of nuclear energy, the principles of prevention and optimization have greatly limited the emission of radioactive substances. In this way, the radiation exposure associated with emissions from nuclear power plants during normal operation has been kept low compared with natural radiation exposure and its variance. This also applies to the local public in the vicinities of such plants. The present health hazard to the public arising from ionizing radiation is only a small fraction of the man-made risk to which the public is exposed in this country. This is also due to the fact that radiation protection employs the principle of prevention, which has been laid down in legal regulations. In this respect, the concepts and criteria developed in radiation protection for evaluation, limitation and optimization may be useful examples to other areas of safety at work and environmental protection. The acceptance of nuclear power is decisively influenced by the remaining residual risk of accidents. Extremely careful inspection and supervision of the technical safety of such plants is indispensable to prevent major accidents. The German risk study for nuclear power plants has made an important contribution to this end. It is being continued. However, risk research must always be accompanied by risk comparison to allow numerical risk data to be evaluated properly and important features to be distinguished from unimportant ones. (26 refs.)

70727 Including plant operating parameters in the remote monitoring systems of nuclear power plants. P.Tolksdorf, H.Wolf.
Atomwirtsch.-Atomtech. (Germany), vol.28, no.5, p.264-8 (May 1983). In German.
Automatic remote monitoring systems for nuclear power plants are already operated in the German Federal States of Bavaria, Lower Saxony, and Schleswig-Holstein. In the other Federal States with nuclear power plants under construction and in operation, decisions have been taken to install such remote monitoring systems. These systems are intended to monitor the emissions of radioactive substances associated with the operation of nuclear power plants. Since the issuance by the State Committee on Atomic Energy of a general recommendation of remote monitoring there has been a discussion about the need to include in this remote monitoring also plant operating parameters of nuclear power stations and, if so, these criteria are (1) the activity inventory in the plant and the critical magnitudes of releases, (2) the integrity of the safety barriers and containment of the activity inventory, and (3) the retention of radioactive materials and identification of potential release pathways. (6 refs.)

70728 Applications of optical fibers to analog telemetry delay lines and sensing systems. P.B.Lyons (Los Alamos Nat. Lab., Los Alamos, NM, USA), S.D.Personick, G.A.Hayward.
IEEE J. Sel. Areas Commun. (USA), vol.SAC-1, no.3, p.555-61 (April 1983).
Describes requirements for a broad-band analog telemetry link for nuclear test monitoring. The authors also describe prototype hardware developed to meet these requirements. (5 refs.)

70729 Controlling radiation exposures in nuclear plants. M.D.Naughton, R.A.Shaw, C.J.Wood (Electric Power Res. Inst., Palo Alto, CA, USA).
Power (USA), vol.127, no.4, p.99-102 (April 1983).
A major industry research program is tackling radiation fields created outside the core. Its goal is to develop practices to prevent their formation, and methods to remove offending sources already present. (7 refs.)

70730 Radiation processing dosimetry. W.L.McLaughlin (Center for Radiation Res., NBS, Washington, DC, USA).
Radiat. Phys. & Chem. (GB), vol.21, no.4, p.359-66 (1983).
Measurements of ionizing radiation quantities of intense photon and electron radiations are used to establish quality control of industrial radiation processes. The most important quantity is absorbed dose as determined through traceability of routine dosimetry to calorimetry or standard chemical dosimetry. Some crucial concerns of dosimetry are: (1) calculations and measurements of radiation energy depositions; (2) improved radiation interac-

tion data in condensed media; (3) radiation scattering behavior for different substances and spectral distributions; (4) secondary radiation phenomena at boundaries and in dielectrics; (5) environmental effects on dosimetry response and analysis. (50 refs.)

70731 Dose conversion factors for intakes of selected radionuclides by infants and adults. J.R.Johnson, D.W.Dunford.
Report AECL-7919, Atomic Energy Canada Ltd., Chalk River, Ont. (Jan. 1983), 32 pp.
Since an earlier report on this subject was written in 1979 the International Commission on Radiological Protection (ICRP) has completed its review of its recommended models for internal dosimetry and has published extensive data used in their calculations of annual limits on intake for workers. In addition, age dependent models to calculate doses for several elements have been improved, new dosimetry factors have become available in computer readable form, several papers describing the derivation and use of dose conversion factors have been published and errors and omissions in tables included with the 1979 report have been identified. It was therefore decided to rewrite this report, taking into account the ICRP recommended models and model parameters, the new dosimetry factors, and the new age dependent models. As in the previous report, the committed effective dose equivalent and the committed dose equivalent to the organ receiving the highest dose per unit intake by Reference Infant (the one year old) and Reference Man are given. The revised format of the tables containing this information should make this report considerably easier to use than was the original. (30 refs.)

70732 Nonlinear theory of the compression of a relativistic electron beam by coherent electromagnetic radiation. Yu.P.Bliokh, I.N.Onishchenko, Ya.B.Fainberg.
Fiz. Plazmy (USSR), vol.9, no.2, p.389-91 (March-April 1983). In Russian. English translation in: *Sov. J. Plasma Phys. (USA)*
A nonlinear theory of the excitation of electromagnetic waves in a relativistic electron beam by betatron oscillations of electrons in the self magnetic field of the beam is presented. It is shown that the beam is compressed so long as field amplitude of the wave being excited does not reach a maximum value determined by the capture of electrons. (5 refs.) *A.G.C.*

70733 Progress report on the Daresbury Laboratory Synchrotron Radiation Facility. K.R.Lea (Sci. & Engng. Res. Council, Daresbury Lab., Daresbury, England).
Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.35-6
The Synchrotron Radiation Source (SRS) at Daresbury, is now in its second year of scheduled operation. Ten experimental stations on four beam ports have been used to date (August 1982) for research programmes in X-ray, VUV, UV and infrared spectral regions. Several more stations are close to completion. These include three for atomic and molecular spectroscopy on beamline 3, one for powder diffraction, and others to supplement existing provision for EXAFS, protein crystallography, small angle scattering, X-ray interferometry, and photoemission. Hard X-ray radiation ($\lambda_c=0.93$ Å) has been obtained from the wiggler magnet (a 3-pole superconducting device with a central field of 5.0 Tesla) and a 7-station wiggler beamline is under construction. Single bunch operation of the storage ring is under development, to provide ~0.2 nsec light pulses at 320 nsec intervals; further work to eliminate weak parasitic bunches is proving necessary before good time-resolved spectroscopic data can be taken. (no refs.)

70734 SSRL: operations and research. P.Pianetta, I.Lindau (Stanford Synchrotron Radiation Lab., Stanford Univ., Stanford, CA, USA).
Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.39-40
This is a brief synopsis of some of the highlights of research results and major instrument improvements at SSRL during the past year. (no refs.)

70735 Current beamline status of Aladdin. C.H.Pruett (Synchrotron Radiation Center, Stoughton, WI, USA).
Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.41-2
The parameters of Aladdin are exceptionally good for a source of synchrotron radiation extending up to approximately 4 KeV. With a smaller source size and higher output flux than Tantalus, Aladdin should be much more productive than the smaller machine. At the present time 16 out of the total of 36 beam ports have been assigned for implementation by the SRC staff and by Participating Research Times (PRTs). Ten of the ports will be implemented by the SRC and six by PRTs. In addition three beamlines have been proposed by PRTs and are awaiting final design and/or funding. The remaining 17 ports are uncommitted at present. (no refs.)

70736 Progress report—Aladdin. E.M.Rowe (Synchrotron Radiation Center, Stoughton, WI, USA).
Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.43-6
During the nine months December 1, 1981 through August 31, 1982, progress on commissioning Aladdin has been slow but steady. (no refs.)

29.25 PARTICLE SOURCES AND TARGETS, PREPARATION AND TECHNOLOGY

(see also 07.77 Particle production and handling; targets)

70737 Applied-B field ion diode studies at 3.5 TW. D.J.Johnson, P.L.Dreike, S.A.Slutz, R.J.Leeper, E.J.T.Burns, J.R.Freeman, T.A.Mehlhorn, J.P.Quintenz (Sandia Nat. Labs., Albuquerque, NM, USA).
J. Appl. Phys. (USA), vol.54, no.5, p.2230-41 (May 1983).
The performance of 7 and 14 cm radius, applied *B*-field, focusing ion diodes is investigated on the Proto II accelerator at a diode power of 3.5 TW. The ion production efficiency of the 14-cm diode is determined to be approximately 80% for the 30-ns power pulse used. When a 2 Torr air background gas was used in the beam propagation region between the diode and the target, the ion beam was observed to be approximately 70% magnetically neutralized in regions of approximately 20 kG transverse *B*-field and $\geq 95\%$ in regions of no *B*-field. The local and global divergence of the 1.4-MV beam were each determined to be approximately 1°. Local source power brightness of $>1.5\times10^{13}$ W/cm^2/rad^2 is inferred. (18 refs.)

70738 Direct observation of fermion spin superposition by neutron interferometry. J.Summhammer, G.Badurek, H.Rauch (Atominst. der Osterreichischen Univ., Wien, Austria), U.Kischko, A.Zeilinger.
Phys. Rev. A (USA), vol.27, no.5, p.2523-32 (May 1983).
The coherent superposition of oppositely polarized neutron beams of equal amplitude results in a final beam polarization perpendicular to the polarization of both initial beams. This polarization can be rotated by purely scalar interaction applied to the beams before superposition, which is equivalent to an additional Larmor precession applied to the beam after superposition. The authors have directly observed these effects in an experiment performed using the perfect-crystal neutron interferometer at the high-flux reactor at Grenoble. This paper gives the experimental results and discusses their theoretical foundation. (28 refs.)

70739 Measurement of linear polarization of high-energy photon beams. E.A.Vinokurov, V.F.Boldyshev.
Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.492-7 (April 1983). In Russian.
It is shown that in track device triplet photoproduction with selection of events within a suitable range of invariant mass values of the pair permits are to obtain a high (up to 96%) asymmetry of the recoil-electron distribution and thereby to optimize photon-beam linear polarization measurements. (20 refs.)

29.30 RADIATION SPECTROMETERS AND SPECTROSCOPIC TECHNIQUES

70740 Determination of reactor neutron spectra with multicomponent activation detectors. J.V.Sandberg, P.D.Lund (Dept. of Tech. Phys., Helsinki Univ. of Technol., Espoo, Finland).
J. Radioanal. Chem. (Switzerland), vol.76, no.1, p.151-70 (1983).
A procedure is described for the functional fitting of reactor neutron spectra with C/E^n and fission spectra. The method is applied to multicomponent activation detector measurements in a Triga research reactor. In multicomponent detectors a mixture of several detector materials is irradiated as a single unit and measured simultaneously for all reaction products with a Ge(Li) gamma ray spectrometer. (21 refs.)

70741 A Compton suppression gamma-ray spectrometer for low level counting. I. Radioanalytical evaluation. J.op de Beeck, A.Isebaert, J.Hoste (Inst. for Nuclear Sci., Rijksuniv. Gent, Gent, Belgium).
J. Radioanal. Chem. (Switzerland), vol.76, no.1, p.225-39 (1983).
A Compton suppression gamma-ray spectrometry system has been evaluated for its use as a low level radioactivity counting facility. The system consists of a premium quality Ge(Li) detector surrounded by a shield of NaI(Tl) detec-

tor material. Compton suppression is obtained by operating the two detector systems in anti-coincidence. Spectrum collection hardware consists of a NP11-A (DEC) interface for two ADCs and a PDP 11/T 10 minicomputer with 64 K byte core memory. Software development and system operation modes are described. System performance as a function of physical characteristics of the sample, scattering angle and gamma-photon energy, is discussed. Continuum reduction for cascaded gamma-transitions and natural background are considered separately. (11 refs.)

70742 In-beam gamma-ray spectroscopy with heavy ions. D.Pelte (Phys. Inst., Univ. Heidelberg, Heidelberg, Germany), D.Schwalm.
In book: *Heavy ion collisions. Vol.3,* R.Bock [Ed.], p.1-297. Amsterdam, Netherlands: North-Holland (1982), x+666 pp. [0 444 85352 9]
The authors begin with some theoretical background to their subject matter. This includes sections on electromagnetic properties of nuclear states, nuclear model predictions, and angular correlations and distributions. Experimental aspects of in-beam gamma-ray spectroscopy are discussed, including the detection of gamma-rays, and the general properties and analysis of gamma-ray spectra. The final section describes methods used in in-beam gamma-ray spectroscopy with heavy ions, discussing reaction mechanism studies and nuclear structure studies. (202 refs.)

70743 Probing nuclei far from stability with heavy ions. J.H.Hamilton (Phys. Dept., Vanderbilt Univ., Nashville, TN, USA).
In book: *Heavy ion collisions. Vol.3,* R.Bock [Ed.], p.573-665. Amsterdam, Netherlands: North-Holland (1982), x+666 pp. [0 444 85352 9]
The author looks first at the advantages which heavy ions offer as probes, in studying nuclei far off stability. There are sections on nuclear mass studies, beta delayed particle emissions, alpha and proton radioactivities, gamma ray and conversion electron spectroscopy, laser spectroscopy and the synthesis of heavy and superheavy nuclei. (333 refs.)

70744 Sulfur isotopes identification by Bragg curve spectroscopy. D.Fabris, F.Gramegna, I.Iori, A.Moroni, G.Nebbia, G.Prete, R.A.Ricci, G.Viesti (Istituto Lab. Nazionale di Fisica Nucleare, Lab. Nazionali di Legnaro, Legnaro, Italy).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.47
The Bragg Curve Spectroscopy (BCS) is an alternative utilization of the ionization chamber. In principle it should allow both mass and charge identification by measuring the parameters characterizing the Bragg curve of the heavy ions stopped in the detector gaseous medium. The authors report on the discrimination between sulfur isotopes using a BCS ionization chamber at the Legnaro Tandem Laboratory. (2 refs.)

(for mass spectrometers, see 07.75)

70745 Beyond proton decay: other physics possibilities with the Homestake nucleon decay detector. M.L.Cherry, I.Davidson, K.Lande, C.K.Lee, E.Marshall, R.I.Steinberg (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA).
AIP Conf. Proc. (USA), no.96, p.248-64 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
The Homestake Gold Mine presently houses the Brookhaven solar neutrino experiment and a 300-ton water Cerenkov detector at a depth of 4200 meters water equivalent. The Cerenkov detector has been used to study nucleon decay, multiple muons, and neutrino bursts. An array of liquid scintillator, with surface area of 130 m^2, is presently being constructed to measure magnetic monopoles, neutrino oscillations, underground muons, and neutrino bursts. At the same time, a 1 km^2 extensive air shower array is being built on the surface in order to measure the high energy cosmic ray composition with simultaneous surface and underground shower measurements. Future plans call for a 1406-ton liquid scintillator Tracking Spectrometer to measure nucleon decay, n-n̄ transitions, and the low energy cosmic ray neutrino spectrum. The authors describe the present results and the possibilities for physics other than nucleon decay in the nucleon decay detectors. (19 refs.)

70746 A plasmochemical model of self-quenching Geiger-Muller counters. S.I.Ivanov, A.T.Peeva (Faculty of Phys., Univ. of Sofia, Sofia, Bulgaria), T.I.Karatoteva.
Bulg. J. Phys. (Bulgaria), vol.10, no.1, p.116-22 (1983).
A plasmochemical model of a self-quenching GM counter containing inert gas and quenching components is proposed based on the assumption that the counter is identical in chemical and, to a certain extent, in electrical respect with the static reactor with corona discharge for plasma polymerization of organic vapours. It is assumed that dissociation and polymerization reactions of the quenching component take part in the counter and that these reactions produce ultimately unreactive species. A set of equations is proposed for describing the changes in the gas mixture during the operation of the counter. The possible changes in the reagents and gas products concentrations as well as of the total pressure in the counter have been studied. The model proposed has been confirmed by experimental data obtained during studies on polymeric species deposited on the anode of an aged counter with a gas mixture containing inert gas argon and quenching component methylal, ethanol and isopentane. (8 refs.)

70747 Comparison of the spectrometric characteristics of the FEU-110, FEU-139, and RCA 4524 photomultipliers. S.D.Kalashnikov, V.L.Krivoshein (All-Union Sci.-Res. Inst. of Medical Instrumentation, Moscow, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.990-2 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR),* vol.25, no.4, p.190-1 (July-Aug. 1982). [received: May 1983]
The results of measurements of the energy resolution of the FEU-139 photomultiplier (PM) are reported; this PM has an antimony potassium cesium photocathode of diameter 63 mm, and the measurements are performed with an NaI(Tl) spectrometric detector of diameter 63×63 mm using gamma-radiation energies of 60 keV (^{241}Am), 122 keV (^{57}Co), and 662 keV (^{137}Cs). In terms of its spectrometric characteristics, the FEU-139 is superior to the FEU-110 and is on a par with its foreign-made counterpart, the RCA 4524. (1 ref.)

70748 Microdefects in X-ray radiation detectors. V.P.Gimanov, L.A.Kholodova, D.A.Goganov, E.V.Blyakher, V.V.Korolev, E.V.Solov'eva.
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1022-4 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR),* vol.25, no.4, p.218-21 (July-Aug. 1982). [received: May 1983]
The spectrometric characteristics of Ge radiation detectors and structural defects in the initial Ge were investigated. It was found that detectors which are made from dislocation-free Ge exhibit better spectrometric and electrophysical characteristics than those made from Ge with dislocations: intense spurious lines in the recorded spectra are missing, and the voltage of operation is increased by a factor of 3-5. (3 refs.)

70749 Responses of some solid state nuclear track detectors to high-energy neutrons and protons. F.Spurny, K.Turek (CSAV, Praha, Czechoslovakia).
Jad. Energ. (Czechoslovakia), vol.29, no.4, p.141-5 (April 1983). In Czech.
Responses of some solid state nuclear track detectors (SSNTDs) in the neutron and proton beams of the synchrocyclotron of the Laboratory of Nuclear Problems of the Joint Institute of Nuclear Research, Dubna—USSR was established. The responses of some polymer SSNTDs without an external charged particle radiator and also with a radiator of fission (or spallation) fragments (Au, Bi, Th, U) were studied. The responses of a glass SSNTD were established only for the detector in contact with a fragment radiator. The SSNTDs studied were treated by chemical as well as electrochemical etching. The responses obtained are analyzed and compared with some published data. Some possibilities of the use of such detectors fdor high-energy particle detection and dosimetry are also discussed. (17 refs.)

70750 A low pressure drift chamber for the neutron radiography. J.V.Zanevsky, Z.Moucka, T.Netusil, V.D.Peschov, B.Sitar.
Jad. Energ. (Czechoslovakia), vol.29, no.4, p.148-52 (April 1983). In Russian.
Describes a low pressure drift chamber in which space coordinates of two points on an alpha-particle track are determined. By means of these coordinates and using reconstruction of the alpha-particle track outgoing from the (n, alpha) reaction, the neutron conversion point in the convertor can be determined by simple calculation. (3 refs.)

70751 Helium streamer chamber with laser track registration at gas pressures of up to 5 atm. A.Budziak, N.P.Bobrova, I.V.Falomkin, V.I.Lyashenko, G.B.Pontecorvo, A.G.Potekhin, V.Z.Serdyuk, Yu.A.Shcherbakov (Joint Inst. for Nuclear Res., Dubna, USSR), D.Sporea, M.V.Stabnikov, M.A.Tombak, K.Zeliger.
Opt. Appl. (Poland), vol.12, no.3-4, p.461-70 (1982).
Shows that the particle track detection with a laser can be successfully performed in a helium chamber at helium pressures of up to 5 atm, if some insignificant admixtures of methane and water vapours are let into the chamber. (13 refs.)

70752 Further improvements in the design of a positron camera with dense drift space MWPC's. R.Bellazzini, A.Del Guerra, M.M.Massai, W.R.Nelson, V.Perez-Mendez, G.Schwartz, G.Spandre.
Report INFN/TC-83/5, Ist. Naz. Fis. Nucl., Pisa, Italy (24 Feb. 1983), 4 pp.
The authors describe the improvements achieved in the last three years towards the construction of a large solid angle Positron Camera with dense drift space MWPCs. A multiplane three-dimensional Tomograph is proposed, made of six MWPC modules (active area 45×45 cm^2 each), arranged to form the lateral surface of a hexagonal prism. Its expected performance is presented and is shown to be very competitive with the multiring scintillator Positron Camera. (8 refs.)

70753 Diogene, a 4-π detector for light charged particles emitted in relativistic heavy ion collisions. J.P.Alard (LPC, Clermont-Ferrand, France), J.Augerat, R.Babinet, F.Brochard, Y.Cassagnou, J.P.Costilhes, L.Fraysse, J.Girard, P.Gorodetzky, J.Gosset, J.Julien, C.Laspalles, M.C.Lemaire, D.L'hote, B.Lucas, G.Montarou, A.Papineau, M.J.Parizet, J.Poitou, C.Racca, J.C.Tamain, Y.Terrien, H.Ueno.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.27
Diogene is a detector with a solid angle close to 4π. It is essentially made of a time projection chamber and is able to detect in coincidence a few tens of charged light particles emitted in relativistic heavy ion collisions. Curvature of the trajectories, induced by an axial magnetic field, associated to the energy loss in the detector gas, allows one to distinguish the different masses relative to a given charge. A trigger, made of 30 boards of plastic scintillator arranged as a barrel, surrounds the detector. Diogene's construction is just finished and the last tests with beam (α particles) are being processed. A plastic wall located at 0°, analogous in conception to the Berkeley one associated with the Plastic Ball, is being joined to Diogene. This wall is a complement trigger (time of flight) and a complement to the solid angle not seen by Diogene in the forward direction. It is under construction. The whole assembly should be operational in 1983, when Saturne II in Saclay will deliver relativistic heavy ions. (no refs.)

31.00 THEORY OF ATOMS AND MOLECULES

(see also 71. Electron states in condensed matter)

70755 Bill Bright Memorial Lecture—models for conduction in molecular solids. T.J.Lewis (School of Electronic Engng. Sci., Univ. Coll. of North Wales, Bangor, Wales).
Electrostatics 1983. Sixth Conference on Electrostatic Phenomena, Oxford, England, 13-15 April 1983 (Bristol, England: IOP 1983), p.129-40
Modern concepts concerning the electronic states of molecular solids are examined. The importance of localised molecular ion states and of local polarization relaxation in determining their energies is emphasised. The weak interactions of these states and the associated static and dynamic disorder leads to the conclusion that charge transport proceeds by tunnelling, a highly vectorial process, which gives rise to characteristic low mobility. The general features of contact electrification follow naturally from the model. The future development of molecular conductors rather than insulators will be based on these concepts. (18 refs.)

31.10 GENERAL THEORY OF STRUCTURE, TRANSITIONS AND CHEMICAL BINDING

70756 Energy components and relationships for homonuclear diatomics. G.I.Plindov (Nuclear Power Engng. Inst., Acad. of Sci., Minsk, Belorussian SSR), S.K.Pogrebnya.
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.14-18 (6 May 1983).
On the basis of the Thomas-Fermi theory and the virial and Hellmann-Feynman theorems, some new energy relationships for homonuclear diatomics are obtained. The estimation of energy components is given in universal form. (13 refs.)

70757 A model of the electronic configuration of atoms, and a mathematical formulation for the periodic system of elements. A.Shima (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan).
Rep. Inst. High Speed Mech. Tohoku Univ. Ser. B (Japan), vol.46, p.31-47 (1983).
A rule of the filling of electron shells for general elements including an electronic configuration of superheavy elements is presented, and based on this rule, a new model with periodicity for the electronic configuration of elements is proposed. From this result a super-long periodic table up to $Z=362$ is obtained. A general equation for electronic configuration of atoms is found by conducting a mathematical formulation for the periodic system of elements. (10 refs.)

31.15 GENERAL MATHEMATICAL AND COMPUTATIONAL DEVELOPMENTS

70758 A uniform WKB approximation for spheroidal wave functions. M.L.Sink, Byung Chan Eu (Dept. of Chem., McGill Univ., Montreal, Quebec, Canada).
J. Chem. Phys. (USA), vol.78, no.8, p.4887-95 (15 April 1983).
Uniform WKB wave functions are developed for prolate spheroidal wave functions which arise when the Schrodinger equation is given in prolate spheroidal coordinates. A detailed numerical test is presented for angular spheroidal wave functions. It shows that the approximate uniform WKB wave functions are excellent in accuracy. (10 refs.)

70759 Λ-type doubling and term formulae for a $^5\Pi$ state in the intermediate case between Hund's cases (a) and (b). I.Kovacs (Dept. of Atomic Phys., Tech. Univ., Budapest, Hungary).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.41-7 (March 1983).
Explicit expressions valid for all values of Y intermediate between Hund's cases (a) and (b) are obtained for the multiplet term formula and for the width of the Λ-type doubling of $a^5\Pi$ state. (10 refs.)

31.20 SPECIFIC CALCULATIONS AND RESULTS

70760 Calculations of medium effects on absorption and emission spectra by SCRF theory. F.Zuccarello, A.Raudino, G.Buemi (Istituto Dipartimentale di Chimica, Univ. di Catania, Catania, Italy).
THEOCHEM (Netherlands), vol.10, p.265-70 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The self consistent reaction field (SCRF) theory inserting the reaction field approach into the Hartree-Fock formalism, allows one to calculate the variations in the wavefunctions of a molecule experiencing the action of whatever polarizable external medium. The authors used this method to study the solvent shifts in the absorption and emission spectra of the isomeric molecules, pyridazine, pyrimidine and pyrazine. (6 refs.)

70761 *LS* term-dependent and configuration-average Hartree-Fock calculations for complex atoms and ions. D.C.Griffin (Rollins Coll., Winter Park, FL, USA), M.S.Pindzola.
Comments At. & Mol. Phys. (GB), vol.13, no.1, p.1-18 (1983).
Discusses the calculation of atomic structure for complex atoms and ions using wave-functions constructed from Hartree-Fock radial functions. In particular, the authors consider two approaches to such calculations: one involves the use of configuration-average radial functions, and the other employs *LS* term-dependent radial functions. Although these methods have been applied to such problems for many years, their use and interpretation continue to cause confusion within the current literature. (35 refs.)

70762 Optimisation of multi-configuration self-consistent field (MCSCF) orbitals. II. Calculation of total pi-electron energies and dipole moments of some non-alternant hydrocarbons. P.R.Ray, N.G.Mukherjee (Chem. Dept., Univ. Coll. of Sci., Calcutta, India).
Indian J. Chem. A, vol.21A, no.9, p.864-8 (Sept. 1982). [received: May 1983]
A multi-configuration self-consistent field (MCSCF) procedure developed earlier by the authors has been used for the calculation of total pi-electron energies and dipole moments of some non-alternant hydrocarbons. Results show a consistent improvement over the SCF and SCFCI results. Analysis of the choice of excited configurations shows that a major improvement can be achieved by considering only a few low-lying excited states. (16 refs.)

70763 N-N bond in dinitrogen tetroxide. C.W.Bauschlicher, A.Komornicki, B.Roos (Polyatomics Res. Inst., Mountain View, CA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.4, p.745-8 (23 Feb. 1983).
Dinitrogen tetroxide is a weakly bound dimer of NO_2, whose geometrical and electronic structure has been the subject of numerous experimental and theoretical investigations over the past 30 years. The molecule is characterized by two NO_2 groups whose geometrical parameters are virtually identical with those found in free NO_2 and a very long, 1.78 Å, N-N bond. Previous calculations have been unable to reproduce this geometrical structure. The authors report the results of a series of CAS-SCF calculations which employ a double-ζ plus polarization quality basis set. Their extensive CAS-SCF calculations, which include 18 electrons correlated in 12 valence orbitals, not only reproduce the known experimental geometry but also show that a proper description for N_2O_4 is associated with a correct description of the individual NO_2 fragments. (20 refs.)

70764 Penetration effects in 'non-penetrating' states. C.E.Theodosiou (Dept. of Phys. & Astron., Univ. of Toledo, Toledo, OH, USA).
J. Phys. B (GB), vol.16, no.10, p.L309-12 (28 May 1983).
Energy shifts due to the core penetration by Rydberg state electrons are usually small. It is pointed out, however, that they should be appropriately included if high-accuracy spectroscopic analyses are desired. The author examines these effects for the f and g states of neutral C, N, O and Ne and he finds that corrections due to penetration lower the polarisability values, in better agreement with ab initio theoretical predictions. (7 refs.)

70765 The empirical general harmonic force field of ethane. J.L.Duncan, R.A.Kelly (Dept. of Chem., Univ. of Aberdeen, Aberdeen, Scotland), G.D.Nivellini, F.Tullini.
J. Mol. Spectrosc. (USA), vol.98, no.1, p.87-110 (March 1983).
A total of 175 spectroscopic data, accumulated from 10 isotopic species of ethane, are used to define all 22 parameters of the harmonic potential function within narrow limits. Before calculation, numerous Fermi resonances have been identified and quantified through infrared and Raman spectroscopic studies of CH_3CD_3 and its ^{13}C isotopic species. This is an essential prerequisite to such an investigation, without which a self-consistent empirical data set cannot be achieved from which to determine physically meaningful force constants. Comparison of the empirical force constants with those predicted by scaled ab initio calculations shows an excellent degree of correspondence in all force constants, and confirms that both approaches can lead to essentially identical results. Calculated values of spectroscopic data of reliable quality are listed. These should be of value to future spectroscopic investigation of isotopic ethanes and for resolving the many resonance perturbations which are present. (26 refs.)

70766 Self-consistent field vibrational energies for a system of coupled oscillators using the hypervirial and the Hellmann-Feynman theorems. A.Requena, R.Pena (Phys.-Chem. Dept., Murcia Univ., Murcia, Spain).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.471-5 (May 1983).
A self-consistent field description of coupled anharmonic oscillators is proposed to obtain energy eigenvalues by using the hypervirial and Hellmann-Feynman theorems. The equations are solved numerically for a model of two anharmonic oscillators, which describes the normal vibration of a pair of coupled oscillators. The results are compared with numerical calculations that have been previously carried out for this system. (11 refs.)

70767 Relation between total energy, electronic potential at the nucleus and chemical potential. Application to the helium isoelectronic series in Hartree-Fock theory. L.C.Balbas (Dept. de Optica, Univ. de Valladolid, Valladolid, Spain), J.A.Alonso, M.L.Zorita.
Phys. Lett. A (Netherlands), vol.95A, no.2, p.89-91 (18 April 1983).
A formal relation between the total energy, the electronic potential at the nucleus and the chemical potential is derived within the context of density functional theory of atomic ions, using the homogeneity properties of the energy functional. An explicit application is then performed for two-electron ions in the context of the Hartree-Fock approximation. (10 refs.)

70768 Local spin-density description of multiple metal-metal bonding: Mo_2 and Cr_2. J.Bernholc, N.A.W.Holzwarth (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).
Phys. Rev. Lett. (USA), vol.50, no.19, p.14512-4 (9 May 1983).
Bonding and dissociation properties of multiply bonded Mo_2 and Cr_2 molecules are examined with use of the local spin-density theory and ab initio pseudopotentials. The equilibrium properties are in good agreement with experimental data. The core-polarization shifts are large; pseudopotentials give accurate results for multiply bonded systems only if outer-core *p* electrons are

included in the calculations. The results confirm the applicability of pseudopotential technqiues to these systems. (29 refs.)

70769 New spectroscopic proofs supporting the existence of a σ,π coupling between a benzenic chromophore and an α carbon atom without the need of hyperconjugative hydrogen atoms and symmetry elements. D.Denis-Courtois, B.Vidal (Univ. des Sci. et Techniques de Lille, Villeneuve d'Ascq, France).
Spectrosc. Lett. (USA), vol.16, no.4, p.267-74 (1983).
It is not essential to describe in terms of symmetry the coupling between the π_ϕ cloud and the σ skeleton of the substituent in benzyl derivatives (ϕCH_2X). Symmetry conditions are too restrictive. More precisely, spectroscopic data in the near UV range support the idea that neither a C_{3v} symmetry ($-CX_3$), nor a C_s one ($-CH_2X$ or $-CHX_2$), which previously seemed to be required from the substituent to observe that σ,π coupling, is in fact necessary. It is always possible to produce, from atomic orbitals belonging to C_α and orbitals of H and X involved in the C-H and C-X bonds, combination which have nodal surfaces allowing a coupling with the p_π orbitals. C-H bonds are not to be privileged in the treatment: all the substituents on C_α participate in the hyperconjugative process. The authors' results have been established with molecules where X is $-CO_2H$, $-CO_2^-$ or $-OH$. (10 refs.)

70770 Bond-alternating Huckel-Mobius and related, twisted linear, cyclic and helical systems—their molecular orbitals, energies and phase correlation upon dissociation. Ying-Nan Chiu (Dept. of Chem., Catholic Univ. of America, Washington, DC, USA).
Theor. Chim. Acta (Germany), vol.62, no.5, p.403-27 (1983).
Cyclic group formalism and screw symmetry operation are used to clarify and generalize the definition of Huckel and Mobius systems. It is shown that the Mobius ring system has half-integral pseudo-angular momentum similar to that of spin space, and that applications of Mobius electronics to chemical reactions have been based on truncated single-circle Mobius rings which have unique beginning and end. Definition of a Huckel versus Mobius ring system for in-plane and out-of-plane π, δ and ϕ orbitals as well as the appropriate relative angle of twists are given. Using the concept of the compatibility of the twist (screw) angle and rotation around a ring, the author also derives the proper phase coherence and energy correlation between a parent cyclic (Huckel or Mobius) molecule and its dissociated linear fragments. The concept of parentage in diabatic fragmentation is discussed. For finite, open, helical chain molecules, an exact period boundary condition based on the compatibility of twist angle and number of turns in a helical ring parent molecule is applied to derive their analytic wavefunctions. For bond-alternating 'linear' and cyclic Huckel and Mobius systems the author also derives the explicit LCAO-MO wavefunctions, energies, their degeneracies and their exact corresponding quantum members for even and odd atom systems at highest bonding and lowest antibonding levels. (42 refs.)

70771 Σ-factorization method: a new development of molecular-orbital theories based on one-centre approximation of atomic and molecular densities. A.W.Niukkanen, L.A.Gribov (Vernadsky Inst. of Geochem. & Analytical Chem., Acad. of Sci., Moscow, USSR).
Theor. Chim. Acta (Germany), vol.62, no.5, p.443-60 (1983).
A new approach to one-centre approximation methods initiated by Mulliken and Ruedenberg in their earlier works has been developed in this paper. Despite the similarity of underlying ideas, the proposal to factorize the *s*-function product instead of the total density factorization along with a new technical background of the method provide more flexible and practical scheme since large orbital quantum numbers do present no longer the crucial point for extending the approach for compounds with heavy atoms. Both minimal and extended schemes are equally within the scope of the method. The technical links with the nuclear shell model formalism are discussed briefly. (26 refs.)

70772 Electronic structure and magnetic properties of the PO_3^{2-} radical: a molecular-orbital study. J.Weber, Y.Cornioley (Lab. de Chimie Theorique Appliquee, Univ. de Geneve, Geneva, Switzerland), M.Geoffroy.
Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.636-40 (29 April 1983).
Spin-polarized and non-spin-polarized molecular-orbital MS Xα calculations have been performed for the radical PO_3^{2-}. ^{31}P and ^{17}O magnetic hyperfine tensors are determined together with the spin densities in the different orbitals of these two atoms. These results are in good agreement with the experimental values. It is shown that ≈20% of the Fermi contact coupling is due to inner-shell polarization. (17 refs.)

70773 MS Xα and LCAO Xα calculations of ionization potentials. A comparison with Koopmans' theorem and accurate calculations. G.de Alti, P.Decleva, A.Lisini (Istituto di Chimica, Univ. di Trieste, Trieste, Italy).
Chem. Phys. (Netherlands), vol.76, no.2, p.185-93 (15 April 1983).
Ionization potentials of small molecules are calculated by the MS Xα and LCAO Xα methods. The results are compared with the experimental values and the results of previous accurate calculations. The Xα method proves to be rather accurate and potentially superior to the HF method. Indication is found of a possible failure of the method in the fluoromethanes. The limitation of the MS Xα method is discussed. (69 refs.)

70774 Basis set effects on spectroscopic constants for C_2 and Si_2 and the symmetry dilemma in the *Xα* model. B.I.Dunlap (Naval Res. Lab., Washington, DC, USA), W.N.Mei.
J. Chem. Phys. (USA), vol.78, no.8, p.4997-5003 (15 April 1983).
In an attempt to perform thorough and accurate linear combination of atomic orbitals (LCAO) *Xα*, calculations on $C_2$and Si_2, the effects of basis set composition on the computed spectroscopic constants are investigated for the first time. The questions of how to tell if an adequate basis set has been found and what *Xα* state corresponds to the lowest state of $^1\Sigma_g{}^+$ symmetry which involves strong electron correlation effects are addressed. With the larger bases, general agreement with experiment and previous density functional calculations are obtained. Remarkable agreement with the configuration interaction (CI) calculations of Bruna et al. (1980) on Si_2 is obtained if the fractional occupation number method of Slater et al. (1969) is used. 31.20L Statistical model calculations (Thomas-Fermi and Thomas-Fermi-Dirac models)

70775 The calculation of diamagnetic susceptibilities from the Thomas-Fermi-Amaldi theory of atoms. M.C.Donnamaria, E.A.Castro, F.M.Fernandez (Seccion Quimica Teorica, INIFTA, La Plata, Argentina).
J. Chem. Phys. (USA), vol.78, no.8, p.5013-15 (15 April 1983).
The importance of the Fermi-Amaldi correction for the Thomas-Fermi theory of atoms is re-examined with respect to a recent work [P. Csavinsky, Int. J. Quantum Chem., vol.15, p.511 (1979)]. The calculated values of diamagnetic susceptibilities show an improvement over values determined from the Thomas-Fermi theory. (16 refs.)

70776 Is the condition for bound-state formation insensitive to structure changes in a finite cluster of like charges with self-consistent Thomas-Fermi screening?. N.H.March (Theoretical Chem. Dept., Univ. of Oxford, Oxford, England).
Phys. Lett. A (Netherlands), vol.95A, no.5, p.223-4 (2 May 1983).
A finite cluster of N like charge Ze is considered in the self-consistent Thomas-Fermi theory. It is shown that a necessary condition for bound-state formation is $NZ > \sqrt{3}/4$, independent of structure. (6 refs.)

31.20N Semi-empirical NDO calculations (CNDO, INDO, MINDO, PCILO methods, etc.)

70777 CNDO/S calculations of resonance Raman spectra and pre-resonance excitation profiles of organic molecules. G.Marconi (Istituto FRAE-CNR, Bologna, Italy).
THEOCHEM (Netherlands), vol.10, p.289-94 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The relative enhancement of the Raman intensities in the pre-resonance region has been computed for naphthalene, using the vibronic coupling expansion proposed by Albrecht (1971). The relevant vibronic and transition moments have been computed in the CNDO/S approximation while the normal coordinates of naphthalene have been evaluated using a MINDO/3 program. The experimental pattern of intensities is reproduced in satisfactory way both for b_{3g} and a_g vibrations. The most important states and the main vibronic terms in the expansion are individuated and discussed with respect to the vibronic borrowing present in the fluorescence spectrum of naphthalene. For styrene, the nature of the low-lying singlet states has been investigated through calculation of the resonance Raman spectrum and the pre-resonance Raman profiles of the three modes of C=C stretching nature. A satisfactory agreement with the experiment is found and an analysis of the main contributions to the intensity is provided in terms of vibronic matrix elements. The possibility of destructive interference of diagonal and off-diagonal terms is analyzed for the three modes examined. (13 refs.)

70778 An MNDO study of sulfenium ions. J.L.Ginsburg (Dept. of Chem., Saint Mary's Univ., Halifax, NS, Canada), R.F.Langler.
Can. J. Chem. (Canada), vol.61, no.3, p.589-93 (March 1983).
An MNDO study has been carried out on a variety of substituted sulfenium ions and sulfides. Relative stabilities in the gas phase have been calculated for several pairs of regioisomeric sulfenium ions. Sulfenium ions are stabilized by π-donors and that the substituent electronegativity is not an important factor. The potential implications of this result for the mechanism by which chlorosulfonium cations are converted into sulfenium ions in solution is discussed. Substituent effects on the energetics of sulfenium ion formation from sulfides have been obtained. These effects also are related to the substituent's π-donating ability. A frontier-orbital analysis of selected sulfenium ions has been done and is discussed. (19 refs.)

70779 Molecular orbital study of several γ-aminobutyric acid-uptake inhibitors. S.Guha, D.Majumder (Crystallography & Molecular Biology Div., Saha Inst. of Nuclear Phys., Calcutta, India).
Indian J. Chem. B, vol.21B, no.9, p.875-7 (Sept. 1982). [received: May 1983]
CNDO/2 method has been applied to study the electronic and conformational aspects of several γ-aminobutyric acid (GABA)-uptake inhibitors, like guvacine, isoguvacine and β-aminoisobutyric acid. The minimum energy conformations of these molecules have been computed and the relevant distances in these compared with those of GABA and nipecotic acid, a powerful GABA-inhibitor. (6 refs.)

70780 Removal of anomalies in CO_2 calculations by using symmetry functions in fixed configurations. G.Blyholder, F.Ruette (Dept. of Chem., Univ. of Arkansas, Fayeteville, AR, USA), J.D.Head.
Spectrosc. Lett. (USA), vol.16, no.4, p.299-309 (1983).
Questions have been raised about level crossing, anomalous minima and discontinuities in properties for CO_2 as the molecule is bent from a linear geometry. The question of semi-empirical vs. ab initio calculations has also

been raised. The work of Van-Catledge (1974) clearly showed the source of the discontinuities to be a level crossing. Further, the use of configuration interaction eliminated the slope discontinuity for the energy of the ground state wavefunction. However in his INDO energies for specific configurations there were still discontinuities in the energy. MINDO/3 calculations for CO_2 with a fixed configuration of symmetry functions are presented which indicates that the discontinuities are readily eliminated. (9 refs.)

31.20P Other semi-empirical calculations (Hückel, generalized Hückel, PPP methods, etc.)

70781 Theoretical investigation on hydroformylation reactions. III. Hydrocarbonyliron-propylene π-intermediates. V.Bellagamba, R.Ercoli, A.Gamba (Istituto di Chimica Fisica, Univ. di Sassari, Sassari, Italy).
THEOCHEM (Netherlands), vol.10, p.333-9 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
For pt.II see J. Organometal. Chem., vol.235, p.201 (1982). The formation of possible intermediates from hydrocarbonyliron and propylene, the simplest model system of an olefin with an asymmetric double bond, was investigated. Extended Huckel calculations predict four stable isomers of the π-complex $H_2Fe(CO)_3$-propylene generated by reciprocal rotation of the component moieties. Their optimized geometries were calculated, and their stabilization curves turned out to have no barriers. The minimum energies of the conformers are strictly comparable, and their interconversion path was determined. Two of these isomers seem more apt to turn into a linear alkyl and the other ones are more favourable to a branched alkyl. (6 refs.)

70782 Explicit construction and algebraic structures of Huckel propagators and their applications. K.Nishikawa, M.Yamamoto, S.Aono (Dept. of Chem., Kanazawa Univ., Kanazawa, Japan).
J. Chem. Phys. (USA), vol.78, no.8, p.5031-42 (15 April 1983).
Propagator theory is developed in the Huckel model. Analytical expressions of Huckel propagators for linear and ring molecules with and without bond alternation are obtained by analyzing the Dyson's equation. Further, the propagators for molecules of complex topological structures are constructed in systematic ways with those for simpler linear and ring systems. By applying the partitioning technique to the Dyson's equation, it is easily shown that the propagators of complex systems are formally brought into the same form as those for the simple ones with renormalized Coulomb and resonance integrals. Finally, some physical quantities are directly evaluated by the integration method proposed by Coulson (1940). (26 refs.)

31.20R Valence bond calculations (ab initio or not)

70783 Electronic interactions in heterocyclic compounds: 2-substituted benzoxazoles. J.M.Angelelli, J.C.Poite (Faculte des Sci. et Techniques de Saint-Jerome, Marseille, France).
Spectrosc. Lett. (USA), vol.16, no.3, p.193-7 (1983).
The determination of a valence-bond model for the $\nu_{C=N}$ vibration in 2-substituted benzoxazoles is possible using a quantitative method, based on integrated infrared intensities. By comparison with the parent compounds, 2-substituted benzothiazoles, the authors conclude that the electronic interactions in benzoxazoles may lead to similar correlations to those already described for benzothiazoles. (10 refs.)

31.20T Electron correlation and CI calculations

70784 MRD-CI calculations for the low-lying electronic states of scandium hydride and titanium hydride. J.Anglada (Univ. Bonn, Bonn, Germany), P.J.Bruna, S.D.Peyerimhoff, R.J.Buenker.
THEOCHEM (Netherlands), vol.10, p.299-308 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The authors report some results of current calculations on ScH and TiH, in the hope of aiding experimentalists to understand the available measured data or to stimulate interest for future investigations in this direction, both by theoretical and experimental methods. They include results for the dissociation energies. (24 refs.)

70785 The relative stability of $^2\Sigma^+$ and $^2\Pi$ states in the systems CSi^-, Si_2^-, SiP and P_2^+ as predicted in MRD-CI calculations. P.J.Bruna, H.Dohmann, J.Anglada, V.Krumbach, S.D.Peyerimhoff (Univ. Bonn, Bonn, Germany), R.J.Buenker.
THEOCHEM (Netherlands), vol.10, p.309-18 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The ab initio MRD-CI (multi-reference single and double-excitation CI) method with configuration selection and the use of various perturbative corrections is employed for the calculation of the various electronic states of the title molecules. (35 refs.)

70786 Bond alternation in infinite polyene: Peierls distortion reduced by electron correlation. S.Suhai (Friedrich-Alexander-Univ. Erlangen-Nurnberg, Erlangen, Germany).
Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.619-25 (29 April 1983).
The formation of the bond-alternating structure in polyene is investigated both within the one-particle (Hartree-Fock) picture and including electron correlation effects by perturbation theory. An off-diagonal charge-density wave of the equidistant structure is identified at the Hartree-Fock level as precursor of the bond-alternate state which is found by subsequent lattice optimization. The valence-shell correlation energy is calculated by using second-order Moller-Plesset perturbation theory. It is found to be finite also in the metallic one-dimensional chain and a comparison with results obtained for the acetylene unit shows that this method recovers ≈70-75% of the total valence-shell correlation. Correlation effects are shown to reduce the Peierls distortion and the corresponding energy barrier but the bond alternation persists also if the results are extrapolated to the case of full correlation. (32 refs.)

70787 Comments on the unlinked cluster effects in limited CI calculations of electron affinities. A.Balkova (Polymer Inst., Acad. of Sci., Bratislava, Czechoslovakia).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.49-52 (6 May 1983).
The effect of unlinked clusters in limited configuration interaction calculations is studied in the calculation of electron affinities. The role of unlinked clusters is estimated through the renormalization term in fourth order of the many-body perturbation theory expansion. The size-inconsistency problem is discussed in the calculation of properties which are given as energy differences. (21 refs.)

70788 Cluster expansion of the wavefunction. Outer- and inner-valence ionization spectra of CS_2 and COS. H.Nakatsuji (Dept. of Hydrocarbon Chem., Kyoto Univ., Kyoto, Japan).
Chem. Phys. (Netherlands), vol.76, no.2, p.283-93 (15 April 1983).
The ionization spectra of CS_2 and COS are calculated by the SAC CI theory for both the outer- and the inner-valence region. The theoretical spectra compare well with the Mg Kα and He II photoelectron spectra, as well as the previous results for CO_2. In the inner-valence region, the theoretical spectra consist of a large number of peaks due to a mixing between single ionizations and simultaneous ionization-excitation (shake-up) configurations. Assignments of the observed spectra and explanations of the origins of the similarities and differences in the photoelectron spectra of CO_2, CS_2 and COS are given. The important role of four-electron excited configurations in addition to three-electron ones, which are included as unlinked terms in the SAC CI theory, is indicated. (24 refs.)

70789 Singlet cyclobutyne: a relative minimum on the C_4H_4 potential energy hypersurface?. G.Fitzgerald, P.Saxe, H.F.Schaefer,III (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.4, p.690-5 (23 Feb. 1983).
The lowest singlet and triplet electronic states of cyclobutyne have been investigated by using the nonempirical molecular electronic structure theory. Initially, singlet cyclobutyne was studied with use of two-configuration self-consistent-field (TCSCF) methods and triplet cyclobutyne with single-configuration SCF theory. Three standard basis sets, of double-ζ (DZ) through double-ζ plus polarization (DZ+P) caliber, were employed, the largest being designated C(9s5p1d/4s2p1d), H(4s1p/2s1p). Geometrical structures and harmonic vibrational frequencies were determined with use of analytic gradient techniques. Subsequently, the different stationary points were subjected to electron-correlation studies, including in a fully variational manner as many as 74625 configurations. (36 refs.)

70790 Structure and energetics of [4.4.4.4.]fenestrane. J.M.Schulman, M.L.Sabio, R.L.Disch (Dept. of Chem., City Univ. of New York, Flushing, NY, USA).
J. Am. Chem. Soc. (USA), vol.105, no.4, p.743-4 (23 Feb. 1983).
The energetics of the D_{2d} and C_{4v} forms of [4.4.4.4.]fenestrane were explored by ab initio calculation. Geometries were optimized in the STO-3G basis set and relative energies, heats of formation and strain energies were calculated at the SCF level in the 6-31G* basis set and to second order in electron correlation in the 4-31G basis set. The strain energy of the more stable D_{2d} form is found to be 160 kcal/mol. The C_{4v} form is estimated to be less stable than the D_{2d} form by 48.3 kcal/mol. (16 refs.)

70791 MCSCF/CI investigation of the low-lying potential energy surfaces of the formyloxyl radical, HCO_2. D.Feller, E.S.Huyser, W.Thatcher Bordon, E.R.Davidson (Dept. of Chem., Univ. of Washington, Seattle, WA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.6, p.1459-66 (23 March 1983).
Configuration interaction calculations have been performend on the low-lying potential energy surfaces of the formyloxyl radical. Minima and transition-state geometries were determined by an MCSCF procedure. The energies were then refined by large CI calculations. These calculations show the radical to have a σ ground state and a low-energy π excited state. On the ground-state surface, the lowest C_{2v} $^2B_2$ and $^2A_1$ energies are connected by a low-energy path passing through $^2A'$ points with unequal C-O bond lengths. This surface contacts the second $^2A'$ surface at the $^2B_2$-$^2A_1$ crossing point to form a Jahn-Teller double cone. On the lowest surface for a π radical, a C_{2v} $^2A_2$ energy is found to be a minimum, but there is very little energy change of large-amplitude asymmetric stretching. The transition states for fragmentation of HCO_2. to H.+CO_2 and for rearrangement to .CO_2H have also been determined. (20 refs.)

70792 Molecular orbital study of proton transfer in $(H_3NHOH_2)^+$. S.Scheiner (Dept. of Chem. & Biochem., Southern Illinois Univ., Carbondale, IL, USA), L.B.Harding.
J. Phys. Chem. (USA), vol.87, no.7, p.1145-53 (31 March 1983).
Ab initio molecular orbital methods are used to study transfer of the central proton in the asymmetric $(H_3NHOH_2)^+$ system. Calculations are performed at the Hartree-Fock level with basis sets of split-valence (4-31G) and double-ζ plus polarization function (DZP) quality. The effects of electron correlation upon the transfer potentials are computed via the generalized valence bond (GVB) and polarization configuration interaction (POL-CI) techniques. The barrier to proton transfer between NH_3 and OH_2 heightens as the distance between the latter two molecules is increased. At the equilibrium R(NO) hydrogen-bond length, the transfer potential contains a single minimum, $(H_3NH...OH_2)^+$, in which the central proton is more closely associated with NH_3. In both the rapid and adiabatic models of proton transfer, there is no energy barrier to decay of $(H_3N...HOH_2)^+$ to the equilibrium $(H_3NH...OH_2)^+$ structure. While all the calculations agree on the above points, there are some notable quantitative discrepancies between the various methods. Enlargement of the basis set at the Hartree-Fock level results in higher transfer barriers with subsequent inclusion of electron correlation (POL-CI) leads to barrier reductions. The GVB procedure, with its partial treatment of correlation, produces changes in the potentials opposite to those observed for the more complete POL-CI treatment. (43 refs.)

70793 Applicability of a pseudopotential CI method to the investigation of ground and excited states of molecular systems: NaCO, Li_2H, Al_2 and AlH. G.Pacchioni (Inst. fur Phys. Chem., Freie Univ. Berlin, Berlin, Germany).
Theor. Chim. Acta (Germany), vol.62, no.5, p.461-75 (1983).
The potential energy curves for the ground and first excited states of some molecules involved in very different problems of theoretical chemistry have been determined employing the pseudopotential (PP) SCF procedure followed by multireference double-excitation configuration interaction treatment (MRD CI). The influence of the choice of the basis set is widely discussed. The PP results are overall in excellent agreement with the results obtained from the analogous all electron (AE) calculations when sufficiently flexible basis sets are adopted. Some small discrepancies encountered are due to the use of minimal basis sets. (36 refs.)

31.50 EXCITED STATES

70795 **Triplet 4*d* states of H_2: experimental observation and comparison with an ab initio model for Rydberg-state energies.** E.E.Eyler, F.M.Pipkin (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA).
Phys. Rev. A (USA), vol.27, no.5, p.a2462-78 (May 1983).
The triplet 4*d* states of H_2 have been studied by using a tunable single-mode dye laser to excite metastable molecules in the $2p\ ^3\Pi_u$ state to the 4*s* and 4*d* triplet states. Ninety-three transitions were detected and their line positions measured. Some of these states decay primarily to predissociation. A simple model for the energies of the Rydberg states was developed; the model depends upon the polarizability and quadrupole interactions of the Rydberg electron with the H_2^+ core. It provides a remarkably good description of the measured energy intervals. (29 refs.)

70796 **Comparisons of approximate bases for hydrogen in a magnetic field.** M.L.Zimmerman, R.G.Hulet, D.Kleppner (Dept. of Phys., MIT, Cambridge, MA, USA).
Phys. Rev. A (USA), vol.27, no.5, p.2731-4 (May 1983).
Solutions to the diamagnetic Hamiltonian for Rydberg states of hydrogen are studied in the low-magnetic-field regime where term mixing can be ignored. Several recently proposed approximate bases are compared by calculating the overlap integrals with an accurate numerically generated basis. (12 refs.)

70797 **High resolution laser spectroscopy of low-lying *p*-states in Sr I and Ba I.** E.R.Eliel, W.Hogervorst (Natuurkundig Lab., Vrije Univ., Amsterdam, Netherlands), T.Olsson, L.R.Pendrill.
Z. Phys. A (Germany), vol.311, no.1-2, p.1-6 (1983).
Hyperfine structure and isotope shifts of the second excited *P* states of SrI and Ba I have been measured. In addition, the Sr I first resonance line has been studied. The present results are combined with existing data on both high-lying and lower-lying excited states, in a simple parametric study of the level isotopic shifts in Sr I. (22 refs.)

Chem. Phys. (Netherlands), vol.76, no.2, p.203-18 (15 April 1983).
Local normal-mode analysis for a collinear potential energy surface generates a system of curvilinear coordinates, which are orthogonal in the mass-skewed system. The motion is locally separable in these coordinates. The author compares the utility of one of the normal modes as a transversal-vibration coordinate, with the conventional choice of the direction perpendicular to the reaction coordinate in the mass-skewed system. The comparison is done for two commonly used reaction coordinates: BEBO and the steepest-descent path. Results differ for different choices of directions and reaction coordinates. Future work should concentrate on a choice of a reaction coordinate which is itself one of the normal modes. (38 refs.)

(inc. properties other than energy)

70799 **Scaled diatomics-in-molecules (SDIM) theory. I. General theory and preliminary applications to H_3 and H_4.** F.O.Ellison (Dept. of Chem., Univ. of Pittsburgh, Pittsburgh, PA, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5024-30 (15 April 1983).
Diatomics-in-molecules (DIM) is an established semiempirical theory for calculating atomization energies and potential energy surfaces for polyatomic systems in ground and excited states. A fundamental deficiency of this method must be considered its omission of optimum scaling of the diatomic and polyatomic wave functions. A new scaled DIM (SDIM) theory is proposed which utilizes a basis of scaled exact atomic state eigenfunctions. Scaled atoms-in-molecules (SAIM) theory [Theor. Chim. Acta, vol.51, p.241 (1979)] is employed to generate approximate optimumly scaled diatomic fragment eigenfunctions. Rigorous theory is formulated for independent variational scaling of polyatomic state functions using established DIM algorithms. Polyatomic eigenvalue equations are solved in terms of diatomic and monatomic eigenvector and empirical eigenvalue input; no complex electronic integral computations are required, except for overlap (as in ordinary DIM theory) and kinetic energy integrals. Initial applications to H_3 and H_4 using a minimal basis set are reported. (31 refs.)

32.00 ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS

32.20 ATOMIC SPECTRA GROUPED BY WAVELENGTH RANGES

70800 Crystal-split electronic states of an atom in a rare gas crystal. Calculation of the absorption and fluorescence spectra of trapped oxygen (^3P, ^1D, ^1S) atoms. D.Maillard, J.Fournier, H.H.Mohammed (Lab. de Spectrochimie Moleculaire, Univ. Pierre et Marie Curie, Paris, France), C.Girardet.
J. Chem. Phys. (USA), vol.78, no.9, p.5480-92 (1 May 1983).
A method is proposed to determine the (crystal perturbed) energy levels of a guest species at any point inside the trapping site of an inclusion distorted host crystal. It relies on available pair potential energy curves, usually deduced from ab initio data supplemented by long-range dispersion energy when necessary. It is applied here to oxygen in its atomlike ^3P, ^1D or ^1S state imbedded in Ne, Ar, Kr, and Xe Matrix and allows reproduction of transition energies within 0.03 eV, and other experimental features. Its broad field of application could find many other exploitations, some of which are proposed. (36 refs.)

70801 Non-monotonic variation of the quantum defect in Cs nD$_J$ term series. C.-J.Lorenzen, K.Niemax (Inst. fur Experimentalphys., Univ. Kiel, Kiel, Germany).
Z. Phys. A (Germany), vol.311, no.3, p.249-50 (1983).
The nS and nD$_J$ levels of Cs have been measured with a thermionic diode applying Doppler-free two-photon spectroscopy and a vacuum wavemeter. The ionisation energy of Cs was derived to high precision from Rydberg-Ritz fitting procedure. The quantum defects of the nD$_J$ series have a surprising, non-monotonic dependence on n. (9 refs.)

32.20B Radiofrequency, microwave, and infrared spectra

(inc. magnetic resonance spectra)

70802 Radio-frequency and laser spectroscopy studies of low-lying states in SrI. P.Grundevik, M.Gustavsson, I.Lindgren, G.Olsson, T.Olsson, A.Rosen (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).
Z. Phys. A (Germany), vol.311, no.3, p.143-9 (1983).
Precision hyperfine structure (HFS) measurements in the $5s4d\ ^1D_2$ metastable state of ^{87}Sr were performed using the laser radio-frequency double resonance method. The magnetic dipole and electric quadrupole interaction constants were $a=-5.5734(4)$ MHz and $b=55.421(6)$ MHz. In addition high-resolution laser spectroscopy experiments were performed in the $5s4d^1D_2\rightleftharpoons 5s6p^1P_1$ and $5s4d^1D_2\rightleftharpoons 5p4d^1D_2$ transitions in SrI. The isotope shifts in the transitions and the HFS in the upper states were determined. Comparison of the experimental results with corresponding relativistic self-consistent-field (SCF) calculations shows that the states involved are very strongly perturbed. Therefore no reliable nuclear quadrupole moment for ^{87}Sr can be deduced from the data without more detailed calculations. A relativistic SCF calculation of the electron density at the nucleus was used in combination with muonic values of the nuclear mean square radii to evaluate the field shifts. From the experimental isotope shifts the specific mass shifts in the two transitions can then be deduced. This shift was found to be particularly large in the transition $5s4d^1D_2\rightleftharpoons 5s6p^1P_1$. (22 refs.)

70803 Hyperfine structure of low-lying even levels of ^{161,163}Dy and ^{167}Er by atomic-beam laser-RF double resonance. W.J.Childs, L.S.Goodman, V.Pfeufer (Argonne Nat. Lab., Argonne, IL, USA).
Z. Phys. A (Germany), vol.311, no.3, p.251-2 (1983).
Radiofrequency measurements of the zero-field hyperfine intervals in low levels of ^{167}Er and ^{161,163}Dy have been made as part of a systematic study of the second half of the $4f^N6s^2$ configuration of the neutral rare-earth atoms. Almost no precise HFS data exist for this region, and a preliminary analysis indicates systematic differences between ab initio theory and experiment. (17 refs.)

32.20J Visible and ultraviolet spectra

(for fluorescence and phosphorescence spectra, see 32.50)

70804 Absorption spectrum of atomic bromine (Br I) in the vacuum ultraviolet region. V.N.Sarma, Y.N.Joshi (Phys. Dept., St. Francis Xavier Univ., Antigonish, Nova Scotia, Canada).
J. Phys. B (GB), vol.16, no.10, p.1671-83 (28 May 1983).
The absorption spectrum of bromine was photographed in the region 900-1700 Å on a three-metre normal-incidence spectrograph. The absorption cell consisted of a flash pyrolysis system and the background continuum source was a Garston flash lamp. The Rydberg series converging on $4p^4\ ^3P_2$, $^3P_1$, $^3P_0$ and $^1D_2$ have been greatly extended. One hundred and fourteen additional lines have been classified, more than doubling the number of the classified lines in this region. (16 refs.)

70805 Transitions between excited energy levels of Zr VII. Z.A.Khan, M.S.Z.Chaghtai, K.Rahimullah (Phys. Dept., Muslim Univ., Aligarh, India).
J. Phys. B (GB), vol.16, no.10, p.1685-93 (28 May 1983).
Based on the spectrograms recorded at Lund University, 249 newly classified lines of six times ionised zirconium atoms (Zr VII) are reported. All the 38 energy levels of the $4p^34d$ configuration along with 24 of the $4p^35p$ and 39 of the $4p^34f$ configurations are now established through the transitions $4p^4$-$4p^34d$, $4p^3$(4d-4f, 5p) and $4p^3$(5s-5p) which lie in the wavelength region 290-2500 Å. 32.20R X-ray spectra

70806 Dependence of X-ray energy on number of optical electrons in ions. N.A.Kulagin (Khar'kov State Univ., Khar'kov, Ukrainian SSR).
J. Phys. B (GB), vol.16, no.10, p.1695-702 (28 May 1983).
The paper is devoted to obtaining the dependence of the characteristic X-ray radiation energy of ions on the number of electrons of the nl^N configuration. The common dependence is a fourth degree polynomial in N. Numerical results are derived for the Cr ion. Through a comparison of the theoretical expression with experimental data the electronic states of the Sn ion are determined in various crystals. The X-ray energy values for 3d and 4f ions are deduced. (15 refs.)

32.50 FLUORESCENCE, PHOSPHORESCENCE

(inc. quenching)

70807 Laser studies of electronic energy transfer in atomic copper. Hao-Lin Chen, G.Erbert (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.4985-90 (15 April 1983).
Laser-induced fluorescence and crossed-beam optical pumping and probing techniques were used to study the cross sections of collisional mixing deactivation of electronically excited copper atoms ($^2P_{3/2}$, $^2P_{1/2}$, $^2D_{3/2}$, and $^2D_{5/2}$) in various buffer gases. The cross sections for total deactivation of metastable status ($^2D_{5/2}$, and $^2D_{3/2}$) to the ground state by the collision partners He, Ne, Ar, H_2, D_2 and N_2 at 1450°C are less than 10^{-20} cm^2. Cross sections for the collisional mixing of $^2D_{5/2}$ and $^2D_{3/2}$ levels are more than an order of magnitude larger. However, collisional mixing of the $^2P_{3/2}$ and $^2P_{1/2}$ levels by the buffer gases does take place more rapidly with cross sections in the range of 10^{-16} cm^2. The cross sections for total deactivation of Cu($^2D_{5/3}$) to ground state, collisional mixing of the $^2P_{3/2,1/2}$ levels, and collisional mixing of the $^2D_{5/2,3/2}$ levels by atomic Cu at 1450°C are 4.8×10^{-17}, 8.7×10^{-15}, and 1.7×10^{-15} cm^2, respectively. (10 refs.)

70808 Thermal reservoir effects in resonance fluorescence. G.P.Hildred (Dept. of Math., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England), S.S.Hassan, R.R.Puri, R.K.Bullough.
J. Phys. B (GB), vol.16, no.10, p.1703-19 (28 May 1983).
The authors investigate the resonance fluorescence of a single coherently driven atom in the presence of an additional incoherent field. The analysis is based on a master equation describing the driven atom coupled to a reservoir and the incoherent field may be the black-body field associated with the finite temperature of the reservoir. The incoherent field induces asymmetries in the usual three-peaked Stark spectrum and these are compared with asymmetries derived from other models—notably the 'laser diffusion' model, and a more fundamental analysis. The theory is extended to the case of two or more atoms; the additional side bands (dips) in the fluorescence (absorption) spectrum occurring at higher harmonics of the laser Rabi frequency are also affected by the thermal field. (32 refs.)

70809 Deexcitation rates and fluorescence yields of highly stripped atoms. E.Arndt, E.Hartmann (Zentralinst. fur Isotopen- und Strahlenforschung, Akad. der Wissenschaften, Leipzig, Germany).
Phys. Lett. A (Netherlands), vol.95A, no.3-4, p.146-7 (25 April 1983).
Relativistic calculations of X-ray transition rates, Auger transition rates and fluorescence yields have been performed for highly stripped atomic lead ions. The fluorescence yield is nearly unaffected by the removal of outer-shell electrons and can be calculated from statistical scaling using the transition matrix elements of an atom with one inner-shell vacancy. (5 refs.)

70810 Distribution of photons and atomic momentum in resonance fluorescence. S.Stenholm (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA).
Phys. Rev. A (USA), vol.27, no.5, p.2513-22 (May 1983).
Discusses the connection betwee the atomic-momentum distribution due to photon recoil and photon statistics. A new formulation is presented based on a Fourier transform with respect to momentum. The asymptotic approximation that is equivalent to a Fokker-Planck treatment is found. Resonance fluorescence is treated in detail. The anomalous diffusion contribution recently found by Ashkin, Gordon, and Cook is separated, and its physical significance is discussed. In particular, it is pointed out that it signifies the coherence between successive photon recoil events. It follows that to obtain the correct diffusion expression one must perform the adiabatic elimination of internal atomic degrees of freedom in the frame moving with the atom, including the deflection caused by light-pressure force. Connections to earlier work are discussed. (24 refs.)

32.60 ZEEMAN AND STARK EFFECTS

70811 Zeeman effect at the hydrogen atom in the new Dirac field theory. J.Brana, K.Ljolje, S.Vobornik (Dept. of Phys., Univ. of Sarajevo, Sarajevo, Yugoslavia).
Fizika (Yugoslavia), vol.15, no.1, p.63-74 (Jan.-March 1983).
The weak constant magnetic field effect at the hydrogen atom is considered in the new Dirac field theory. The difference from the conventional theory is found beginning with the Z^2a^2 term. (8 refs.)

70812 Stark effect at the hydrogen atom in the new Dirac field theory. J.Brana, K.Ljolje (Dept. of Phys., Univ. of Sarajevo, Sarajevo, Yugoslavia).
Fizika (Yugoslavia), vol.15, no.1, p.75-81 (Jan.-March 1983).
The weak constant electric field effect at the hydrogen atom is considered in the new Dirac field theory. The difference from the standard theory is found. They begin with the Z^2a^2 term. (7 refs.)

70813 Variation of tensor polarisability in the interacting 5s*n*d ^{1}D$_2$ Sr Rydberg series. G.Gessert, P.Kulina, R.-H.Rinkleff (Inst. fur Atom- und Molekulphys., Abteilung Spektroskopie, Univ. Hannover, Hannover, Germany).
J. Phys. B (GB), vol.16, no.10, p.L313-16 (28 May 1983).
Stark splittings of 5s*n*d ^{1}D$_2$ Sr Rydberg states were measured between $n=11$ and 20 by quantum beat spectroscopy at very low electric field strengths, allowing the determination of tensor polarisabilities. The irregular behaviour of these polarisabilities was confirmed by Coulomb approximation calculations and explained by a simple quantum defect analysis. (4 refs.)

70814 Precision measurement of the Stark shift of the 6*S*-7*S* transition in atomic cesium. R.N.Watts, S.L.Gilbert, C.E.Wieman (Randall Phys. Lab., Univ. of Michigan, Ann Arbor, MI, USA).
Phys. Rev. A (USA), vol.27, no.5, p.2769-72 (May 1983).
The authors measured the Stark shift of the 6*S*-7*S* transition in a beam of atomic cesium with the use of laser spectroscopy. They find this shift to be 0.7103(24) Hz (V/cm)$^{-2}$. From this value the authors determine the static polarizability of the 7*S* state, $\alpha_{7\mathrm{S}}=[6111(21)]a_0^3$, and the 7*P*-7*S* oscillator strength, $f_{7\mathrm{P},7\mathrm{S}}=1.540(7)$. Finally, they derive a new empirical value for the 6*S*-7*S* Stark-induced electric dipole transition probability. (16 refs.)

32.70 SPECTRAL LINE SHAPES AND INTENSITIES

70815 Analysis of the 4d^9-4d^{8}5P transitions in nine-times ionized zenon (Xe X). V.Kaufman, J.Sugar, J.L.Tech (NBS, Washington, DC, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.691-3 (May 1983).
The 4d^9-4d^{8}5p transition array of nine-times ionized xenon at 130-160 Å was photographically observed with the National Bureau of Standards 10.7-m grazing-incidence vacuum spectrograph. The spectral source was a high-voltage spark between carbon electrodes triggered by insertion of a small quantity of xenon. Forty-seven lines were classified as transitions from 34 levels of the $4d^85p$ configuration to the two levels of the $4d^9\ ^2D$ ground term. An excellent correlation was found between the observed and calculated relative intensities. Least-squares-fitted parameter values and their ratios to the Hartree-Fock values are given. (9 refs.)

70816 Precision isotope shifts for the heavy elements. II. Neutral thorium. R.Engelman,Jr., B.A.Palmer (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.694-701 (May 1983).
For pt.I see ibid., vol.70, p.308 (1980). High-resolution spectra of a $^{232}\mathrm{ThI}_4/^{230}\mathrm{ThI}_4$ electrodeless discharge lamp were obtained from 5600 to 36000 cm^{-1} with a Fourier-transform spectrometer. The splittings of more than 2800 Th I isotopic doublets were measured to an accuracy of 0.001 cm^{-1}. Level isotope shifts were determined for 274 even and 318 odd levels of Th I. (15 refs.)

70817 Comment on the note of C.B. Shaw, Jr. on the statistical inference of four ArII transition probabilities. K.-P.Nick, V.Helbig (Inst. fur Experimentalphys., Univ. of Kiel, Kiel, Germany).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.465-7 (May 1983).
Absolute transition probabilities are given for four ArII lines investigated by Shaw (see ibid., vol.24, p.259, 1980). Shaw used regression analysis on a large number of intensity measurements of four ArII lines with different upper-level excitation energies to correct transition probabilities of Schnapauff (1968). Shaw's data were obtained from photographic measurements with a flow-stabilized Ar arc. The authors find that the results obtained by Shaw are in error by as much as his applied correction on a relative scale. It is likely that Shaw made systematic errors. The absolute scale of Shaw's corrected values is off by about 50%. (14 refs.)

70818 Absorption and emission line profile coefficients of multilevel atoms. I. Atomic profile coefficients. I.Hubeny (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia), J.Oxenius, E.Simonneau.
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.6, p.477-93 (June 1983).
The line profile coefficients for absorption and emission appearing in the radiative transfer equation are formulated in terms of atomic line profile coefficients and velocity distribution functions. In order to derive the atomic profile coefficients of a multilevel atom, one defines generalized atomic redistribution functions that describe the correlations between photons involved in a consecutive radiative transitions of the atom. Besides their dependence on the radiation field, the atomic line profile coefficients of a multilevel atom depend on the velocity distributions of the atoms in the various excitation states, in contrast to the case of a two-level atom where only the radiation intensity but not the velocity distributions affect the atomic emission profile. Closed expressions of the atomic profile coefficients in terms of generalized redistribution functions are obtained if stimulated emissions are neglected, and one is led to an iterative approximation scheme if stimulated emissions are taken into account. The possibility of a nonlocal character of the atomic profile coefficients is pointed out, and the effect of elastic, velocity-changing collisions with excited atoms is discussed. A major aim of the paper is to draw attention to the fact that ordinary redistribution functions that describe only the correlations between the absorbed and reemitted photons in the same spectral line are not sufficient to formulate the line profile coefficients of a multilevel atom. (8 refs.)

70819 Absorption and emission line profile coefficients of multilevel atoms. II. Velocity-averaged profile coefficients. I.Hubeny (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia), J.Oxenius, E.Simonneau.
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.6, p.495-506 (June 1983).
For pt.I see ibid., vol.29, no.6, p.477 (1983). Starting from the atomic profile coefficients of a multilevel atom derived in the previous first part of this paper, the authors consider the velocity-averaged line profile coefficients appearing in the radiative transfer equation for the important special case that the velocity distribution of atoms in the ground state is Maxwellian and that the streaming of excited atoms is negligible. Elastic velocity-changing collisions of excited atoms with other particles are taken into account in the framework of a strong-collision model. Neglecting stimulated emissions, they obtain explicit, albeit in some cases approximate, expressions for the line profile coefficients of a three-level atom in terms of the specific radiation intensity locally present. The emission and absorption profile coefficients are written in a form that exhibits the various physical effects responsible for deviations of these profiles from complete redistribution. The case of two-level atoms in the presence of elastic collisions with the excited atoms is also treated. (9 refs.)

70820 Oscillator strengths of neutral and singly ionised molybdenum. S.E.Schnehage, K.Danzmann, R.Kunnemeyer, M.Kock (Inst. fur Plasmaphys., Univ. Hannover, Hannover, Germany).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.6, p.507-16 (June 1983).
Oscillator strengths of 174 Mo(I) and 58 Mo(II) lines in the range 2470-5570 Å were obtained from wall-stabilised arc and hollow cathode measurements. Sets of relative *f*-values were determined by a combination of hook and emission measurements requiring no assumptions concerning the plasma state. The sets have been enlarged considerably by evaluating spectra recorded with a Fourier spectrometer. The relative Mo(I) *f*-values were converted to an absolute scale by means of radiative lifetimes measured by P. Zimmermann and his group. The overall uncertainties are within 10-35%. Since lifetimes of Mo(II) levels are not yet available, only relative Mo(II) *f*-values are presented. (20 refs.)

70821 Improved Ar(II) transition probabilities. K.Danzmann, M.Kock (Inst. fur Plasmaphys., Univ. Hannover, Hannover, Germany).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.6, p.517-20 (June 1983).
Precise Ar(II) branching ratios have been measured on a high current hollow cathode with a 1-m Fourier transform spectrometer. Absolute transition probabilities for 11 Ar(II) lines were calculated from these branching ratios and lifetime measurements published by Mohamed et al. (1976). For the prominent 4806 Å line, the present result is $A_{\mathrm{ik}}=7.12\times10^7\ \mathrm{s}^{-1}\pm2.8\%$, which is in excellent agreement with recent literature data derived from pure argon diagnostics, two-wavelength-interferometry, and H$_\beta$-diagnostics when using the theoretical data of Vidal et al. (1973). (25 refs.)

70822 Lifetime measurements in the case of weak luminescence intensities. E.Geneux (Inst. de Phys. Appliquee, Univ. de Berne, Berne, Switzerland).
Phys. Lett. A (Netherlands), vol.95A, no.2, p.85-8 (18 April 1983). In French.
A simple method concerning the possibility of lifetime's measurement in the case of low light level 20 photons/s, is described. Application to some n^1S$_0$ and ^{1}D$_2$ excited states of the Hg atom is given. (4 refs.)

70823 Radiative lifetimes of some excited levels in Eu II. A.Arnesen, R.Hallin, C.Nording, O.Staaf, O.Vogel, L.Ward (Inst. of Phys., Univ. of Uppsala, Uppsala, Sweden).
Z. Phys. A (Germany), vol.310, no.4, p.251-3 (1983).
Radiative lifetimes of the six levels $6p_{3/2}(7/2,3/2)_{2,3,4,5}$ and $6p_{1/2}(7/2,1/2)_{3,4}$ in Eu II are measured with a laser-ion beam technique using intracavity excitation and tandem pumping. (8 refs.)

32.80 PHOTON INTERACTIONS WITH ATOMS

70824 High-resolution laser spectroscopy of alkali atoms. S.Nakayama (Kyoto Inst. of Technol., Kyoto, Japan).
Mem. Fac. Ind. Arts Kyoto Tech. Univ. Sci. & Technol. (Japan), vol.31, p.40-58 (Dec. 1982). [received: May 1983]
New laser techniques, pulsed and continuous, which make it possible to see optical spectra without Doppler broadening and to enhance sensitivity, are opening new fields with many applications. The determination of structures of alkali atoms is attractive because, being relatively simple atoms with one-electron system, they are good subjects for theoretical studies of modern atomic physics. Some of these measurements of alkali atoms by using high-resolution laser spectroscopy are among the most precise tests of quantum electrodynamics. Quantum beat spectroscopy by a pulsed laser and polarization spectroscopy by a continuous laser are presented as promising high-

resolution spectroscopic techniques for the study of alkali atoms. Lifetimes, hyperfine structures, collisional cross sections of Rydberg (highly-excited) states of cesium have been investigated by quantum beat spectroscopy. Radiative lifetimes and hyperfine interaction constants are found to follow the trends established for lower values of principal quantum numbers, but the measured collisional cross sections are smaller than the extrapolated values. Hyperfine and Zeeman structures of sodium have been examined by using polarization spectroscopy. Although the principal Zeeman structures are resolved, the signals are confusing because of the very large number of cross-over resonances. An interpretation is given, based on a combination of a first-order theory of optical pumping with the theory of dichroism and Faraday rotation. (33 refs.)

Electron scattering in intense laser fields .... See Entry 71013

32.80B Level crossing and optical pumping

70825 Steady state signal in the limit of weak optical pumping with D_1 or D_2 line. S.Legowski, P.Rudecki (Inst. of Phys., Nicholas Copernicus Univ., Torun, Poland).
Z. Phys. A (Germany), vol.310, no.4, p.263-7 (1983).
The simplified rate equations for electronic polarization of alkali atoms in the hyperfine ground states are shown for circularly polarized D_1 and D_2 lines in the limit of weak pumping. The rate equations include effects due to collisional and spin exchange relaxation of atoms in the ground state. Analytical forms of the repopulation pumping terms are shown assuming the standard J-randomization model for relaxation of alkali atoms in resonant ^2P_J states and neglecting energy transfer. Analyses of the analytical steady state solutions have been performed to determine the conditions at which the longitudinal electronic orientation of alkali atoms $\langle S_z \rangle$ and the orientation of atoms in hyperfine sublevels $\langle S_z \rangle_F$ pass through zero. (21 refs.)

32.80D Autoionization

70826 Autoionisation of the higher shells of an atom during β-decay. T.A.Churakova, Yu.G.Smirnov (Voronezh State Univ., Voronezh, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.71-5 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.910-13 (1982). [received: May 1983] (Materials of the Thirty-First All-Union Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, Samarkand, USSR, April 1981).
Describes a further generalisation of the expressions derived by Batkin et al. (1981) for the case of autoionisation of an arbitrary shell during β-decay of any forbiddenness order. The specific numerical calculations were carried out in the nonrelativistic approximation in a more realistic screened potential for the case autoionisation of the L-shell for β-decay of ^{143}Pr, ^{147}Pm, ^{152}Sm, ^{204}Tl and ^{210}Bi. (17 refs.)

70827 Perturbation of the Ba 6sng series at n=24 by zero-field spectroscopy and forced autoionization. T.F.Gallagher, F.Gounand, R.Kachru, N.H.Tran, P.Pillet (SRI Internat., Menlo Park, CA, USA).
Phys. Rev. A (USA), vol.27, no.5, p.2485-92 (May 1983).
The authors report the study of a sharp perturbation of the Ba $6sng\ ^1G_4$ series at $n=24$ by a $5d7d$ level converging to the excited Ba^+5d limit. They compare the traditional spectroscopic approach of determining the strength of the configuration interaction by energy-level perturbations to the values obtained by forced autoionization in an electric field. While the energy of the perturbing $5d7d$ level can be determined accurately by either approach they find a significant difference in the apparent strengths of the configuration interaction. (19 refs.)

32.80F Photoionization and photodetachment

70828 Wave operators for atomic photo-ionisation. H.G.Muller, A.Tip (FOM-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands).
J. Phys. A (GB), vol.16, no.8, p.1641-60 (1 June 1983).
The time development of a system consisting of an atom in an external electromagnetic field with fixed propagation direction is studied (vector potential $A(x,t)=A(x_3-ct)$). It is shown that the Moller wave-operators, relevant for photo-ionisation, exist, provided the components $A_\sigma(u)$ of A decay as $|u|^{-1-\epsilon}$, $\epsilon>0$, for large argument u. Since $A(x,t)$ is not necessarily spatially homogeneous, the above results can serve as a starting point for an investigation of field-gradient effects on photo-ionisation processes. (17 refs.)

70829 Inner-shell photoionisation in molecules: the carbon monoxide case. S.Krummacher, V.Schmidt (Fakultat fur Phys., Univ. Freiburg, Freiburg, Germany), F.Wuilleumier, J.M.Bizau, D.Ederer.
J. Phys. B (GB), vol.16, no.10, p.1733-47 (28 May 1983).
The inner-valence-shell photoionisation of CO has been studied by electron spectrometry using monochromatised synchrotron radiation in the region of 34 to 100 eV. The analysis of the experimental data and the quantitative comparison with theoretical calculations illustrate the important role electron correlation and shape resonances play in the explanation of the main features of these photoelectron spectra. (40 refs.)

70830 Relativistic many-body approach to the photoionization of cesium. W.R.Johnson (Inst. fur Theoretische Phys., Johann Wolfgang Goethe-Univ., Frankfurt am Main, Germany), G.Soff.
Phys. Rev. Lett. (USA), vol.50, no.18, p.1361-4 (2 May 1983).
A relativistic many-body technique which includes particle-hole excitations of the atomic core is developed to describe the photoexcitation of alkali atoms. The technique is used to study the photoionization of cesium near threshold, where the dipole amplitudes are sensitive to both relativistic and correlation effects. The predicted photoionization amplitudes are free from the gauge ambiguities of Dirac-Fock calculations and are in good agreement with semiempirical calculations and with measurements. (20 refs.)

70831 Multiply charged ions induced by multiphoton absorption in rare gases at 0.53 μm. A.l'Huillier, L.A.Lompre, G.Mainfray, C.Manus (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France).
Phys. Rev. A (USA), vol.27, no.5, p.2503-12 (May 1983).
Up to quadruply charged ions are induced in Xe atoms by a 50-psec laser pulse at 0.53 μm in the 10^{12} W cm^{-2} range. The mechanism of the formation of Xe^{2+} ions is elucidated. In the lowest intensity range, Xe^{2+} ions are produced by direct 15-photon absorption from the ground state of the atoms, while at a higher intensity Xe^{2+} ions are produced by a stepwise process via Xe$^+$ ions. These two processes take place at distinctly different intensities. A kinetic model using rate equations affords a good fit with experimental results. Moreover, for the first time it was possible to obtain the multiphoton ionization cross sections related to the two-electron removal from Xe atoms, as well as the one-electron removal from Xe$^+$ ions. (19 refs.)

70832 Angular distribution of 3d photoelectrons in the 3p resonance region of atomic Mn. M.O.Krause, T.A.Carlson (Chem. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.31-2
The authors characterized the resonance region around the 3p level of atomic manganese by both the 3d partial cross section and the 3d photoelectron angular distribution parameter. They study the energy range from 25 to 100 eV, but emphasize the resonance region between about 47 and 60 eV. (3 refs.)

32.80H Auger effect and inner-shell ionization

70833 The *KLL* Auger spectrum of manganese. V.Brabec, O.Dragoun, M.Rysavy, M.Fiser, A.Kovalik (Nuclear Phys. Inst., Czechoslovak Acad. of Sci., Prague, Czechoslovakia), I.Cserny, I.Kadar.
Z. Phys. A (Germany), vol.311, no.1-2, p.37-9 (1983).
The *KLL* Auger electrons of manganese (Z=25) emitted in the ^{55}Fe decay were measured using an electrostatic spectrometer. The computer analysis of the spectra yielded intensity ratios, which agree in all but one item within one standard deviation with the relativistic calculations in the intermediate coupling scheme with configuration interaction. (9 refs.)

Deexcitation rates and fluorescence yields of highly stripped atoms .... See Entry 70809

32.80K Multiphoton processes

70834 Non-Hermitian dynamics of multiphoton ionisation. H.C.Baker (Dept. of Phys. & Astron., Univ. of Kentucky, Lexington, KY, USA).
Phys. Rev. Lett. (USA), vol.50, no.20, p.1579-82 (16 May 1983).
The construction of physical transition probabilities in non-Hermitian, effective-Hamiltonian models of multiphoton ionisation is analysed. Eigenstates of the effective Hamiltonians, $\bar{H}$ and $\bar{H}^\dagger$, are respectively determined to be projected incoming and outgoing states. These models are found to be intrinsically S-matrix models, and the adiabatic eigenstates are used to construct appropriate transition amplitudes. The intermediate-time bound-electron population differs quantitatively from customary norm-of-state constructions. (10 refs.)

33.00 MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS

33.10 CALCULATION OF MOLECULAR SPECTRA

70835 On the rotational distribution of N_2 in the Ar-N_2-discharge. The O-O-band of the second positive system. D.Venzke (Zentralinst. fur Elektronenphys., Acad. der Wissenschaften, Institutsteil IV, Berlin, Germany), J.Mizeraczyk, H.Szczepanska, E.Korn.
Beitr. Plasma Phys. (Germany), vol.23, no.2, p.145-51 (1983).
The rotational distribution of the O-O-band of the second positive system of N_2 was determined by the Ornstein method in the glow discharge of an argon-nitrogen mixture at medium pressure. Evidently, for the rotational R- and P-lines some straight lines can be fitted for rotational quantum numbers between 2 and 60 according to usual representation. The slopes of the curves indicate that the Boltzmann distribution does not exist for all the levels. For each of these straight lines can be declared a value of rotational temperature. The dependence of the several rotational temperatures on the discharge current is essentially lower than the corresponding dependence of the gas temperature, which is calculated by means of the energy balance. The influence of the energy transfer from metastable argon atoms to ground-state nitrogen molecules on the rotational distribution seems to be insignificant. Comparisons with rotational distributions in pure nitrogen plasmas point at the influence of interactions between nitrogen species. (16 refs.)

70836 Ab initio second-order Moller-Plesset calculations of the vibrational spectra of cyclobutadiene and its isotopic derivatives. B.A.Hess,Jr., P.Carsky, L.J.Schaad (Dept. of Chem., Vanderbilt Univ., Nashville, TN, USA).
J. Am. Chem. Soc. (USA), vol.105, no.4, p.695-701 (23 Feb. 1983).
Optimum geometry, IR frequencies and intensities were calculated for cyclobutadiene and seven isotopically substituted derivatives with use of SCF/6-31G* and MP2/6-31G* wave functions. Theoretical spectra agree well with experimental where they are known, except that a result that had been interpreted as showing cyclobutadiene to be square is reinterpreted in terms of a mixture of two nonequivalent dideuterio rectangular structures. (22 refs.)

70837 The $B(^2\Sigma^+)\rightarrow X(^2\Sigma^+)$ transition (4050-4500 Å) in HgI. K.S.Viswanathan, J.Tellinghuisen (Dept. of Chem., Vanderbilt Univ., Nashville, TN, USA).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.185-98 (March 1983).
The $B\rightarrow X$ band system (4050-4500 Å) of HgI is photographed and vibrationally analyzed for the isotopically pure species ^{200}Hg^{127}I and ^{200}Hg^{129}I. The assigned bands span v'' levels 5-26 and v' levels 0-13. The least-squares analysis indicates that the previously accepted v'' numbering for this system is one unit too high. Band-profile simulations and Franck-Condon calculations indicate that the internuclear separation (R'_e-R''_e) is 0.49 Å. The ground-state dissociation energy ($\mathcal{D}_e$) is estimated to be 2750±80 cm^{-1}. Spin splitting is found to contribute significantly to the band structure. (24 refs.)

70838 Coiolis intensity perturbations of the ν_4 band of SF_6. W.B.Person, B.J.Krohn (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.229-57 (March 1983).
In the ν_4 band of $^{32}SF_6$ the intensity of absorption by the *R* branch has been found to exceed that of the *P* branch by 38%. This is substantially larger than the 15% excess that one calculates from ordinary rotational statistics and the nonnegligible width of the band. The authors attribute this imbalance to Coriolis interactions between the rovibrational sublevels (a) of the ν_3 and ν_4 excited vibrational states, and (b) of the ground vibrational state and the $l=1$ (F_{1g}) level of the $\nu_3+\nu_4$ combination state. The intensities of the observed *P*- and *R*-branch lines have a superposed Herman-Wallis type F factor of the form $F(m)=(1+\xi_4 m)^2$, where $m=-J$ for the *P* branch, 0 for the *Q* branch, and $+(J+1)$ for the *R* branch, and *J* is the rotational sublevel in the ground state. The authors determined ξ_4 by a new method from the relative intensities of the *P*, *Q*, and *R* branches. New evidence is reported that supports an earlier conclusion that the first derivatives of the dipole moment function, $\mu_3=\partial\mu/\partial q_3$ and $\mu_4=\partial\mu/\partial q_4$, have the same sign. The corresponding Coriolis effect is calculated for UF_6. It is predicted that Coriolis interactions induce weak absorption in the ν_6 bands of SF_6 and UF_6, which would otherwise be inactive according to selection rules for strong infrared absorption or Raman scattering. An order-of-magnitude estimate of the absorption intensity of the induced ν_6 band of SF_6 agrees with a recent observation of that infrared spectral region. (50 refs.)

70839 *r*-centroids and Franck-Condon factors for the *b′-X* and *b′-b* band systems of the NO^+ molecule. R.R.Reddy (Dept. of Phys., KSRM Coll. of Engng., Cuddapah, India), T.V.R.Rao.
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.6, p.563-4 (June 1983).
The *r*-centroids and Franck-Condon factors for bands of the *b′-X* and *b′-b* systems of the NO^+ molecule have been evaluated by using an approximate analytical method of Jarmain and Fraser (1953). The appearance of some of the bands is discussed in terms of FC factors. (4 refs.)

70840 Vibrational-vibrational and vibrational-translational/rotational processes in methane, oxygen gas-phase mixtures optoacoustic measurements. E.Avramides, T.F.Hunter (School of Chem. Sci., Univ. of East Anglia, Norwich, England).
Mol. Phys. (GB), vol.48, no.6, p.1331-43 (20 April 1983).
Various methane-oxygen mixtures of different compositions and total pressures were studied optoacoustically for vibrational-vibrational and vibrational-rotational/translational characteristics. *V-R*, *T* rates for CH_4-CH_4 and CH_4-O_2 were measured as respectively 0.645 and 0.105 μs^{-1} atm^{-1}. The rate-constants for transfer between the $CH_4(\nu_2, \nu_4)$ bending modes and the oxygen fundamental, ν, are 12 ± 2 μs^{-1} atm^{-1} for $\nu\rightarrow(\nu_2, \nu_4)$ and 1.1 ± 0.2 μs^{-1} atm^{-1} for $(\nu_2, \nu_4)\rightarrow\nu$. The excitation was to $CH_4(\nu_3)$ with a He-Ne laser and, following very fast equilibration with $CH_4(\nu_1)$, three routes of deactivation were followed in O_2 collisions: (i) to the $CH_4(2\nu_4)$ level and thence by CH_4 collisions to the ν_4 fundamental, (ii) to the O_2 overtone (2ν), followed by the O_2 intermolecular process to the fundamental, and (iii) to the O_2 fundamental plus one CH_4 bending mode. Rate constants for routes (i), (ii) and (iii) are given. (15 refs.)

70841 Application of the perturbation-matrix method to exact calculations of the energies and matrix elements of the vibrational-rotational transitions in diatomic molecules. I.I.Tugov, V.P.Chernyavskii.
Opt. & Spectrosc. (USA), vol.53, no.3, p.256-60 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.435-42 (Sept. 1982). [received: May 1983]
A general approach to the solution of the radial Schrodinger equation with an effective internuclear potential, which is essentially the analytical method of the perturbed Morse oscillator and, in its calculation technique, the perturbation matrix method, is examined. The exact solutions and matrix elements are determined by means of recurrence matrix relationships. In contrast to numerical integration methods, solutions can readily be obtained for high vibrational levels ν and large $\Delta\nu$. The efficiency of the method is demonstrated for the case of CO. The accuracy of the calculation of the characteristic values of the energy reaches 5×10^{-5} cm^{-1}. The results of calculations of the matrix elements of vibrational-rotational transitions for ν=0-35, $\Delta\nu$=0-4, and J=0, 50, 100 are given. (25 refs.)

70842 Normal coordinates analysis of the hexamminochromium (III) ion. A simplified $M(NX)_6$ model. R.Acevedo (Dept. of Chem. Engng., Univ. of Chile, Santiago, Chile), G.Diaz.
Spectrosc. Lett. (USA), vol.16, no.3, p.199-206 (1983).
A normal coordinates analysis for the hexamminochromium (III) ion in octahedral symmetry has been undertaken. A simplified $M(NX)_6$ model has been adopted, since many of the gerade vibrational frequencies are still unknown. A very simple and consistent force field is able to reproduce the observed vibrational frequencies as well as giving a reasonable set of force constant for this complex ion. This calculation supports the assignments made in literature by several workers. (14 refs.)

70843 Condensed aromatics. XIX. Perylene. S.J.Cyvin, B.N.Cyvin (Div. of Phys. Chem., Univ. of Trondheim, Trondheim, Norway), P.Klaeboe.
Spectrosc. Lett. (USA), vol.16, no.4, p.239-48 (1983).
The simple five-parameter force-field approximations were applied to perylene. The vibrational frequencies were recalculated. New experimental data from infrared and Raman measurements are reported. The force field was used to calculate mean amplitude of vibration and perpendicular amplitude correction coefficients. (17 refs.)

70844 Revised normal coordinate analysis for the $[Fe(CN)_5NO]$ ion. B.N.Cyvin, S.J.Cyvin (Div. of Phys. Chem., Univ. of Trondheim, Trondheim, Norway), A.Zabokrzycka, B.B.Kedzia.
Spectrosc. Lett. (USA), vol.16, no.4, p.249-54 (1983).
A new normal coordinate analysis for $[Fe(CN)_5NO]$ (symmetry C_{4v}) was performed, using Urey-Bradley force constants from a previous analysis (Kedzia et al., 1972). A few errors in the previous work are corrected. Most of the calculated vibrational frequencies are reproduced within 2 cm^{-1}, but one serious discrepancy occurred. In the new set the lowest frequency of species B_1 is 61 cm^{-1} in contrast to the previously reported value of 223 cm^{-1}. (3 refs.)

70845 Spectra of infrared transitions between highly excited states of polyatomic molecules. A.A.Makarov, V.V.Tyakht (Inst. of Spectroscopy, Acad. of Sci., Troitsk, USSR).
Sov. Phys.-JETP (USA), vol.56, no.2, p.274-81 (Aug. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.2, p.502-15 (Aug. 1982). [received: May 1983]
It is shown that the average spectral characteristics of a highly excited polyatomic molecule (anharmonic shift, broadening, and integrated absorption cross section) can be determined from the constants of the vibrational spectra of low-lying levels. A study is made of the relationship between the intramolecular broadening of harmonic levels and the spectrum of IR transitions in a quasicontinuum of vibrational states. By way of illustration, a calculation is made for the ν_1 mode of a CF_3I molecule. (25 refs.)

33.20 MOLECULAR SPECTRA GROUPED BY WAVELENGTH RANGES

(for magneto-optical and electro-optical spectra, see 33.45; for fluorescence and phosphorescence spectra, see 33.50; for photoelectron spectra, see 33.65)

70846 Electronic spectra of biphenylene and diazabiphenylenes. H.Yamaguchi, M.Ata (Dept. of Chem., Kumamoto Univ., Kumamoto, Japan), J.F.W.McOmie, J.W.Barton, H.Baumann.
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.4, p.599-609 (April 1983).
The absorption, linear dichroism (l.d.) and magnetic circular dichroism (m.c.d.) spectra of biphenylene (**1**), 1,8-diazabiphenylene (**2**) and 2,7-diazabiphenylene (**3**) have been measured. The c.d. spectra of the β-cyclodextrin complexes with **1**, **2** and **3** have also been measured. The first $[(23.0\text{-}36.0)\times10^3\ \mathrm{cm}^{-1}]$ and second $[(36.0\text{-}50.0)\times10^3\ \mathrm{cm}^{-1}]$ absorption bands of **1**, **2** and **3** have been assigned by using the observed spectra and the results of CNDO/S CI calculations. It is concluded that the b_{3u} vibration with a frequency of ca. 780 cm^{-1} takes part in the vibronic coupling between the first and second excited singlet states of **1** and that the second absorption band of **1** is composed of two electronic transitions polarised along the short and long axes. (43 refs.)

70847 Spectroscopy, structure and bonding of high temperature metal halide vapor complexes. G.N.Papatheodorou (Dept. of Chem. Engng., Univ. of Patras, Patras, Greece).
In book: *Current topics in materials science. Vol.10*, E.Kaldis [Ed.], p.249-352. Amsterdam, Netherlands: North-Holland (1982), vi+515 pp. [0 444 86321 4]
The author reviews the available spectroscopic information on the electronic (mainly absorption) and vibrational (mainly Raman) properties of metal halide vapor complexes. Conclusions regarding molecular structures and the correlation of structure with thermodynamic properties are also reviewed. (180 refs.)

70848 Fluorescence excitation of CO in comets. K.S.Krishna Swamy (Tata Inst. of Fundamental Res., Bombay, India).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.882-5 (15 April 1983).
A complete modeling of the CO molecule based on the resonance fluorescence excitation process shows that the triplet-singlet transitions (Cameron bands) should be observable in comets. The expected intensities of these bands for Comet West (1976 VI) are consistent with the observations of Smith et al. (1980). The Angstrom bands arising out of the singlet states may also be observable. The expected intensities of vibrational and rotational transitions are also discussed briefly. (17 refs.)

70849 Determination of the dipole moment of nitrosyl fluoride in the (001) and (101) states by combination of microwave and laser Stark data. G.Cazzoli, C.Degli Esposti, P.G.Favero (Centro di Studio di Spettroscopia a Microonde, Univ. di Bologna, Bologna, Italy).
Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.664-8 (29 April 1983).
The combination of microwave measurements of the Stark effect in the (001) excited vibrational state with fourteen laser Stark transitions of the hot band $(101)\leftarrow(001)$, previously reported in the literature, yielded the values of the dipole moment of ONF both in the (001) and (101) states. (7 refs.)

70850 Electric dipole moments of $(HC^{15}N)_2$ and $HC^{15}NH^{35}Cl$. E.J.Campbell, S.G.Kukolich (School of Chem. Sci., Univ. of Illinois, Urbana, IL, USA).
Chem. Phys. (Netherlands), vol.76, no.2, p.225-9 (15 April 1983).
The electric dipole moments of two linear hydrogen-bound complexes containing HCN have been measured using pulsed Fourier-transform microwave spectroscopy carried out in a Fabry-Perot cavity. The dipole moment of $(HC^{15}N)_2$ is 6.552(35) D and the dipole moment of $HC^{15}NH^{35}Cl$ is 4.817(24) D. Both measurements refer to the vibrational ground state. (21 refs.)

70851 The microwave spectrum of the DO_2 radical. S.Saito, Y.Endo, E.Hirota (Inst. for Molecular Sci., Okazaki, Japan).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.138-45 (March 1983).
The *a*-type $N=1\leftarrow0$, $2\leftarrow1$, and $3\leftarrow2$ and the *b*-type, $1_{11}\leftarrow2_{02}$, $2_{12}\leftarrow3_{03}$, $3_{13}\leftarrow4_{04}$, $6_{06}\leftarrow5_{15}$, and $7_{07}\leftarrow6_{16}$ transitions, 14 in total, of the DO_2 free radical in the ground vibronic state were observed by microwave spectroscopy in the frequency region up to 200 GHz. The DO_2 radical was generated in a free-space absorption cell by a DC discharge in a mixture of CH_3OD and O_2. From the observed spectra the rotational constants, centrifugal distortion constants, spin-rotation coupling constants, and magnetic hyperfine coupling constants were determined with good precision. The hyperfine coupling constants of DO_2 were determined by the present work for the first time. A comparison of the in-plane components of the dipole-dipole interaction tensor of DO_2 with those of HO_2 made it possible to determine the off-diagonal component T_{ab}, and thus the principal values and the principal axes of the tensor. (22 refs.)

70852 1-butyne microwave spectrum, barrier to internal rotation, and molecular dipole moment. B.M.Landsberg (Univ. Coll. of North Wales, Bangor, Wales), R.D.Suenram.
J. Mol. Spectrosc. (USA), vol.98, no.1, p.210-20 (March 1983).
Measurements of rotational transitions of 1-butyne have been made in the range of $\sim$20-130 GHz. Both *a*-type transitions up to $J=46$ and *b*-type transitions up to $J=42$ have been measured and fitted to a rotational Hamiltonian which includes centrifugal distortion terms. In addition to the five quartic centrifugal distortion constants, three sextic coefficients had to be included to reproduce the observed frequencies to within experimental error. The results of the analysis are sufficient for the prediction of all strong transitions throughout the millimeterwave range. A barrier to internal rotation of the methyl group of 3.260 kcal/mole (1 kcal/mole=4.18 kJ/mole) has been derived from the first excited torsional state. Analysis of the second-order Stark effect has led to an accurate determination of both μ_a and μ_b with $\mu_a=0.763(3)$ D and $\mu_b=0.170(4)$ D. (13 refs.)

70853 Microwave spectral study of cyclopentyl acetylene. R.N.Nandi, M.D.Harmony (Dept. of Chem., Univ. of Kansas, Lawrence, KS, USA).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.221-8 (March 1983).
The microwave spectrum of cyclopentyl has been observed and analyzed in the 26.5-40 GHz frequency range. Rotational constants have been obtained for the axial and equatorial conformers as follows (in MHz): $A=4264.820\pm0.429$, $B=2168.762\pm0.009$, $C=2032.080\pm0.009$ for the axial; $A=6349.374\pm0.399$, $B=1765.183\pm0.012$, $C=1480.549\pm0.013$ for the equatorial. Relative intensity measurements showed the equatorial conformer to be more stable by 270±70 cal/mole. A low-frequency ring mode having a fundamental frequency of $40\pm20\ \mathrm{cm}^{-1}$ was observed up to $v=6$. The conformational parameters and pseudorotational potential energy surfaces for various monosubstituted cyclopentanes have been compared and discussed. (14 refs.)

70854 Rotational *l*-type doubling in the $kl=+1$ levels of the ν_4 state of PH_3. S.P.Belov, A.F.Krupnov (Inst. for Appl. Phys., Acad. of Sci., Gorkii, USSR), D.Papousek, S.Urban, G.Cazzoli.
J. Mol. Spectrosc. (USA), vol.98, no.1, p.265-8 (March 1983).
High resolution infrared and microwave studies of rotational *l*-type doubling in symmetric top molecules give valuable information on the anharmonicity of the molecular potential function. It has also been shown recently that transitions between the *l*-type doublets are suitable for interesting microwave-infrared double resonance experiments. Scappini and Schwartz (1981) and Guarnieri et al. (1981) have recently measured the first three direct $(\Delta J=0)$ *l*-doublet transitions in the $\nu_4=1$ state of $PH_3(kl=+1;\ J=1,\ 2,\ 3)$. The authors have extended this measurement to the $J=4$ state and to the $J+1\leftarrow J$ transitions for $J=1$, 2. The microwave $(\Delta J=0)$ and submillimeterwave $(\Delta J=+1)$ transition frequencies are internally consistent within the accuracy of experiment; they are also consistent with the assignments of the ν_4 band transition frequencies published by Tarrago et al. (1981). (12 refs.)

70855 Submillimeter rotational spectrum of nitrogen dioxide $^{14}N^{16}O_2$. O.I.Baskakov, M.V.Moskienko, S.F.Dyubko.
Opt. & Spectrosc. (USA), vol.53, no.3, p.270-2 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.457-61 (Sept. 1982). [received: May 1983]
The frequencies of 96 rotational lines of the ground vibrational state of the $^{14}N^{16}O_2$ molecule have been measured and identified in two sections of the submillimeter range: 300-400 and 657-670 GHz. The rotational, centrifugal, spin-rotational, and spin-spin constants have been calculated. (22 refs.)

Infrared-microwave two-photon spectra of the ν_3 bands of $^{12}CH_3F$ and $^{13}CH_3F$ .... See Entry 70974

Structure and quadrupole coupling measurements on the NO dimer .... See Entry 71036

33.20E Infrared spectra

70856 IR bandshapes of weakly H-bonded systems. II. Complexes of methyl-phenol derivatives with dioxane. B.Czarnik-Matusewicz, J.P.Hawranek (Inst. of Chem., Univ. of Wroclaw, Wroclaw, Poland).
Acta Phys. Pol. A (Poland), vol.A63, no.4, p.563-9 (April 1983).
IR spectra of hydrogen-bonded complexes of four methyl-phenol derivatives with dioxane were measured. A detailed analysis of shape of the stretching vibration band of the proton donor group in these systems was carried out both for the absorbance spectrum $A(\nu)$ and absorption index spectrum $k(\nu)$, yielding profile parameters, band moments, asymmetry factors, correlation functions and correlation times. The results were discussed in terms of Robertson's and Yarwood's theory (1978). (15 refs.)

70857 Methylenecyclohexenes: inversion barriers from the far-infrared spectra. T.L.Smithson, N.Ibrahim, H.Wieser (Dept. of Chem., Univ. of Calgary, Calgary, Alberta, Canada).
Can. J. Chem. (Canada), vol.61, no.3, p.442-53 (March 1983).
The far-infrared spectra of 3-methylenecyclohexene, 4-methylenecyclohexene, and 1-methyl-3-methylenecyclohexene in the region of 80-400 cm^{-1} are reported and interpreted mainly with a view to the two lowest out-of-plane deformations of the cyclohexene ring. Typical C-type band sequences are observed and interpreted in terms of ring inversion modes. Barriers to inversion are determined by means of a one-dimensional Hamiltonian with a quadratic-quartic potential function. Possible ground state geometries and forms of the inversion coordinates are discussed and compared to those thought to occur in the analogous cyclohexenones. (22 refs.)

70858 Vibrational kinetics in He-CO reacting discharges. S.De Benedictis, C.Gorse, M.Cacciatore, M.Capitelli, F.Cramarossa, R.D'Agostino (Dipartimento di Chimica, Univ. Bari, Bari, Italy), E.Molinari.
Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.674-7 (29 April 1983).
Combined measurements of vibrational distributions (N_v) of CO and CO_2 yields (β) in He-CO discharges have been performed at different residence times in radiofrequency discharges. The experimental results on N_v have been obtained by IR emission spectroscopy and on β by gas-chromatographic and mass-spectrometric techniques. A theoretical model including the most important relaxation channels of the vibrational energy has been set up and coupled to the plasma chemistry describing the rate of formation of species such as CO_2, C, and O. Theoretical and experimental results are in good agreement, emphasizing the role of a vibrational mechanism in dissociating CO in He-CO mixtures. (14 refs.)

70859 Infrared and Raman spectra of Ag(I) and Hg(II) complexes of 1-methylthymine. F.Guay, A.L.Beauchamp (Dept. de Chimie, Univ. de Montreal, Montreal, Quebec, Canada), C.Gilbert, R.Savoie.
Can. J. Spectrosc. (Canada), vol.28, no.1, p.13-20 (1983).
The infrared (4000-200 cm^{-1}) and Raman spectra (3100-50 cm^{-1}) of solid samples of 1-methylthymine, the N3-deuterated derivative, and the complexes with CH_3Hg^+, Ag^+ and Hg^{2+} are reported. The Raman spectra of H_2O and D_2O solutions of 1-methylthymine, the anionic form (pH 12) and the CH_3Hg^+ complex are also described. The most interesting regions of these spectra are discussed in connection with the deprotonation and complexation taking place at position N3, and with the secondary interactions involving the carbonyl groups. (31 refs.)

70860 Infrared and Raman orientation correlation functions of the ν_3 vibration of N_2O mixed with rare gases. C.Dreyfus, R.Ouillon, L.Berreby (Dept. de Recherches Phys., Univ. Pierre & Marie Curie, Paris, France).
J. Chem. Phys. (USA), vol.78, no.9, p.5379-83 (1 May 1983).
IR and Raman orientational correlation functions are obtained from the corresponding profiles of the ν_3 band of N_2O at near-identical experimental conditions. The influence of the leak of polarized light is estimated for Raman scattering. The experimental correlation functions corrected for hot bands, are compared to the usual theoretical rotational diffusion models. None of the models fits both the IR and Raman correlation functions. A very good agreement is observed with the Steele perturbation theory, which introduces as the only parameter the mean square torque exerted on the molecule by the medium. (13 refs.)

70861 IR-spectroscopic study of isotope effects on the MH/ND-stretching bands of meso-tetraphenylporphine and vibrational hydrogen tunneling. H.-H.Limbach, J.Hennig, J.Stulz (Inst. fur Phys. Chem., Univ. Freiburg, Freiburg, Germany).
J. Chem. Phys. (USA), vol.78, no.9, p.5432-6 (1 May 1983).
The IR spectra of meso-tetraphenylporphine (TPP) dissolved in CCl_4 have been measured in the NH and ND stretching band region as a function of isotope substitution using a newly constructed vacuum IR cell. Thus, it was possible for the first time to localize the NH and ND stretching bands of TPP-HD, which are characterized by the wave numbers 3335 and 2493 cm^{-1}. TPP-H_2 and TPP-D_2 were found to absorb at lower frequencies, namely 3318 and 2482 cm^{-1}. The observation of this band shift allows one to identify the observed NH and ND stretching bands in TPP-H_2 and TPP-D_2. They arise from antisymmetric stretching vibrations, the symmetric bands being forbidden in the IR spectra. NH/ND stretching bandwidths of the order of 20 cm^{-1} were observed, which is usually small for proton transfer systems. This observation further confirms the authors previous conclusions from the primary HH/HD/DD kinetic isotope effects on the tautomerism in this molecule, namely that the motion of the hydrogen atoms takes place in a coupled manner from discrete vibrational NH stretching levels without substantial coupling to the motion of heavy atoms. Since the symmetric NH stretching vibration has a higher frequency than the antisymmetric stretching vibration, the interaction between the two inner hydrogen atoms in TPP is repulsive. (46 refs.)

70862 Low-temperature infrared spectrum of chlorine nitrate and evidence for the existence of ClOONO. S.C.Bhatla, M.George-Taylor, C.W.Merideth, J.H.Hall,Jr. (School of Geophys. Sci., Georgia Inst. of Technol., Atlanta, GA, USA).
J. Phys. Chem. (USA), vol.87, no.7, p.1091-3 (31 March 1983).
The authors report the matrix-isolated-infrared spectra of chlorine nitrate. The spectra of both synthetic chlorine nitrate and chlorine nitrate produced in the $ClO+NO_2+M\rightarrow products+M$ reaction show infrared absorptions which may be associated with $ClONO_2$ and ClOONO isomers. The infrared absorption frequencies for ClOONO are assigned. (17 refs.)

70863 Interconversion studies and characterization of asymmetric and symmetric dinitrogen trioxide in nitric oxide matrices by Raman and infrared spectroscopy. E.M.Nour, L.-H.Chen, J.Laane (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).
J. Phys. Chem. (USA), vol.87, no.7, p.1113-20 (31 March 1983).
The first laser Raman spectra of both asymmetric dinitrogen trioxide (O_2NNO) and symmetric dinitrogen trioxide (ONONO) have been collected by stabilizing these species in nitric oxide matrices at 12K. Laser irradiation at wavelengths from 5682 to 7526 Å converts as-N_2O_3 to *s*-N_2O_3 but wavelengths of 5145 or 4880 Å convert the symmetric isomer back to the asymmetric one. The Raman data along with the infrared spectra of several isotopic species (with ^{15}N and/or ^{18}O) for both molecules made it possible to resolve previous ambiguities in the vibrational assignments of these isomers and to carry out meaningful force constant calculations for them. The N-N stretching frequency at 266 cm^{-1} for as-N_2O_3 and its stretching force constant of $f_{NN}=0.57$ mdyn/Å both are characteristic of a very weak bond, although these values are higher than previously proposed. The N-O single bond stretching force constant for *s*-N_2O_3 was determined to be 3.61 mdyn/Å. (17 refs.)

70864 Involvement of amine protons in *n*-butylamine-cresol hydrogen bonding. A.Al Awar, M.Codd, N.Pratt, R.M.Scott (Dept. of Chem., Eastern Michigan Univ., Ypsilanti, MI, USA).
J. Phys. Chem. (USA), vol.87, no.7, p.1188-91 (31 March 1983).
Studies of the hydrogen bonding of cresols with *n*-butylamine by difference spectroscopy in the infrared range reveal participation of protons from both the phenols and the amines. A cyclic structure for the interaction is proposed. (11 refs.)

70865 High-resolution photofragment spectroscopy of the O_2^+ $b^4\Sigma_g^-(v'=5\text{-}8)\leftarrow a^4\Pi_u(v''=6\text{-}9)$ first negative system. J.C.Hansen, J.T.Moseley (Phys. Dept., Univ. of Oregon, Eugene, OR, USA), P.C.Cosby.
J. Mol. Spectrosc. (USA), vol.98, no.1, p.48-63 (March 1983).
A laser-ion coaxial beams photofragment spectometer was used to observe absorptions from O_2^+ $a^4\Pi_u(v''=5\text{-}9)$ to predissociated O_2^+ $b^4\Sigma_g^-$ levels in the $v'=5$, 6, 7, and 8 vibrational manifolds. The bands studied were (5,6), (5,7), (6,7), (7,8), and (8,9). The coaxial beams technique was used with a single-mode dye laser and velocity tuning to obtain an overall resolution of 0.003 cm^{-1} in the best cases. A reanalysis of the first negative system, including these data, other bands previously observed in predissociation, and the bands observed in emission at high resolution was performed. The Hamiltonian representation used to determine the molecular constants was that used in the previous study, with the addition of a fine structure term of the form $L_zS_z^3$ in the effective Hamiltonian for the $a^4\Pi_u$ state. This term was significant in the fits for all v'' levels except 8 and 9, where the data are of relatively poor resolution, and improved the fit for the $v''=4$ level by a factor of 5, bringing it into agreement with the experimental uncertainty. In addition to the band-by-band molecular constants, the interconnected bands were combined to calculate merged constants and Dunham coefficients. These constants should provide substantially the most accurate and comprehensive description of the *a* and *b* states of O_2^+ that is currently available. (17 refs.)

70866 Infrared spectra of the matrix-isolated chlorides of iron, cobalt, and nickel. D.W.Green (Chem. Technol. Div., Argonne Nat. Lab., Argonne, IL, USA), D.P.McDermott, A.Bergman.
J. Mol. Spectrosc. (USA), vol.98, no.1, p.111-24 (March 1983).
Iron, cobalt, and nickel metal cathodes were sputtered with various mixtures of $^{37}Cl_2/^{35}Cl_2/Ar$ to produce Ar matrices at 14K that contained the mono-, di-, and trichlorides of the corresponding metal. The measured infrared absorption spectra of these matrices allowed the identification and characterization of $FeCl_2$, $FeCl_3$, CoCl, $CoCl_2$, $CoCl_3$, and $NiCl_2$. The derived vibrational constants of the electronic ground state of $^{59}Co^{35}Cl$ are $\omega_e=457.8\pm3.0$ cm^{-1} and $\omega_ex_e=2.0\pm1.5$ cm^{-1}. The antisymmetric stretching mode frequencies of six isotopomers of $FeCl_2$ and three isotopomers of $CoCl_2$ were identified and measured. The dichlorides of iron, cobalt, and nickel were all determined, in contrast with previous work, to be nonlinear with bond angles of 161, 157, and 161°, respectively. The estimated uncertainty is 5°. For both iron and cobalt trichlorides, the measured stretching mode frequencies were used to derive a Cl-M-Cl angle in excess of 120°, as would be expected for planar molecules with somewhat anharmonic vibrations. Observed adsorption peaks could be assigned to the $\nu_3(E)$ modes of planar (D_{3h}) Fe and Co trichlorides and the corresponding modes of the isotopomers. These observations strongly suggest that recent data supporting a pyramidal geometry for $FeCl_3$ should be reexamined. The geometry of $CoCl_3$ has not previously been determined. (20 refs.)

70867 Infrared spectrum of stannous oxide (SnO). A.G.Maki, F.J.Lovas (Molecular Spectroscopy Div., NBS, Washington, DC, USA).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.146-53 (March 1983).
A tunable diode laser has been used to measure the infrared spectrum of stannous oxide (SnO) in the gas phase between 830 and 868 cm^{-1}. Measurements of the $v=1\text{-}0$, 2-1, 3-2, and 4-3 transitions have been made at temperatures ranging from 930 to 1150°C. Over 175 infrared transitions of the nine most abundant SnO isotopic species have been combined with microwave measurements reported by others in a single least-squares analysis of the data to yield a set of eight Dunham coefficients for the $X^1\Sigma^+$ state of SnO. The data have also been fit by a nonlinear least-squares procedure to obtain B_e, ω_e, and the first five Dunham potential constants. The band center for the vibrational transition of $^{120}Sn^{16}O$ is found at ν_0 $(v=1\text{-}0)=814.70249\pm0.00027$ cm^{-1}. (17 refs.)

70868 Infrared emission spectrum and potential constants of HCl. C.M.Clayton, D.W.Merdes, J.Pliva, T.K.McCubbin,Jr. (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA), R.H.Tipping.
J. Mol. Spectrosc. (USA), vol.98, no.1, p.168-84 (March 1983).
The emission spectrum from a low-pressure hydrogen chloride flame has been recorded in the 3.1-5.3 μm region at high resolution using a 4.5-m grating spectrometer coupled to a PDP-15 computer. The data obtained for the $v\rightarrow v-1$ band sequence, with $v=1$ to 6 for $H^{35}Cl$ and $v=1$ to 5 for $H^{37}Cl$, were combined with other accurate data and analyzed to obtain the vibrational and rotational constants and Dunham coefficients for the $H^{35}Cl$ and $H^{37}Cl$ molecules. Using this information, eighth-order nonlinear least-squares estimates of the Dunham, Simons-Parr-Finlan (1973), Ogilvie (1981), and Sandeman potential constants were computed. While the values of all four sets of constants display a lack of convergence, the constants of Sandeman's expansion exhibit better statistical behavior than the other three. This suggests that a Sandeman-like inversion of the Simons-Parr-Finlan and Ogilvie potential constants would be worthwhile. (33 refs.)

70869 Vibrational spectra and force constants of symmetric tops. Rotational analysis of ν_3 and several hot bands of $H_3Si^{79}Br$ and $H_3Si^{81}Br$ near 430 cm^{-1}. H.Burger, G.Schippel (Anorganische Chem., Univ. Wuppertal, Wuppertal, Germany).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.199-209 (March 1983).
The gas-phase infrared spectra of monoisotope $H_3Si^{79}Br$ and $H_3Si^{81}Br$ in the ν_3 region near 430 cm^{-1} were recorded with a resolution of 0.04 cm^{-1}. The rotational *J* structure of the transitions ν_3, $2\nu_3$-ν_3, $3\nu_3$-$2\nu_3$ $(\nu_3+\nu_6)$-ν_6, and ν_3 of the ^{29}Si isotopomers was analyzed by means of polynomial methods up to *J* values of about 100, and the apparent *k* structure was evaluated by a band contour simulation. The molecular parameters ν_3^0, x_{33}, x_{36}, α_3^A, α_3^B, and D_j have been determined. (14 refs.)

70870 Coriolis perturbation in the fundamentals ν_{11} and ν_{23} of cis, cis-1,4-D_2-buta-1,3-diene. L.Nemes (Res. Lab. for Inorganic Chem., Hungarian Acad. of Sci., Budapest, Hungary), G.Keresztury, G.Jalsovszky, Yu.N.Panchenko, A.-S.Makhniov.
J. Mol. Spectrosc. (USA), vol.98, no.1, p.262-4 (March 1983).
The authors study of vibrational and rotational assignments and Coriolis perturbations for the modes ν_{11} and ν_{23} of the D_2 derivative of 1,3-diene. The perturbations in ν_{11} and ν_{23} bands are strictly analogous to those observed in the parent molecule. Such effects are manifested in the rotational *K* structure which is well resolved in the infrared spectra run on a Nicolet 7199 FT-IR spectrometer at a resolution of 0.06 cm^{-1}. The ground state rotational constants of the dideutero derivative were estimated using the r_{av} geometrical parameters. These estimates, when applied in ground state combination differences, are useful for confirming the *K* assignments of the *Q* branches for perpendicular bands. (9 refs.)

70871 Line strength measurements using diode lasers: the ν_2 band of H_2S. L.L.Strow (NASA/Goddard Space Flight Center, Greenbelt, MD, USA).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.395-406 (May 1983).
The strengths of 94 lines in the ν_2 band of H_2S have been measured with an average accuracy of 3% using a tunable diode laser. The line strengths are determined from the peak absorption of nearly Doppler-shaped lines. A detailed error analysis of this measurement method is given. Ratios of the measured line strengths to strengths calculated assuming no vibration-rotation interactions are shown to range from as low as 0.057 to as high as 4.71. (30 refs.)

70872 Absorptivity of nitric oxide in the fundamental vibrational band. R.F.Holland, M.C.Vasquez, W.H.Beattie, R.S.McDowell (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.435-8 (May 1983).
From observations of the spectral absorbance of mixtures of nitric oxide in nitrogen at room temperature, the authors derive an integrated absorptivity for the NO fundamental band of 137.3±4.6 cm^{-2} atm^{-1} at 0°C. The indicated uncertainty is the estimated maximum error. (14 refs.)

70873 Infrared spectroscopic studies of Cu(II) complexes of purine and pyrimidine bases in D_2O solution. C.R.Krishnamoorthy, M.M.Taqui Khan (Dept. of Chem., Indian Inst. of Technol., Madras, India).
J. Coord. Chem. (GB), vol.12, no.4, p.313-16 (1983).
Studies of metal complexes of purine and pyrimidine bases and their derivatives have received considerable attention recently. The present investigation aims to elucidate the proton ionization sites and metal ion binding sites in these ligands in aqueous solution from IR spectroscopic study of these systems in D_2O. The method employed consisted of the IR study of the ligands in pure D_2O solution in the absence and presence of metal ion at a definite pD value. A pH meter with a mini combination glass and calomel electrode was used to measure the pH of the solution. A spectrophotometer using a cell with a teflon spacing of 0.1 mm was used for all IR measurements. (30 refs.)

70874 Vibrational spectra and force constants of symmetric tops—rotational analysis of the ν_2, ν_5, $\nu_3+\nu_6$ infrared system of H_3SiI near 900 cm^{-1}. F.Lattanzi (Dipartimento di Chimica, Univ. della Calabria, Cosenza, Italy), C.di Lauro, H.Burger, P.Schulz.
Mol. Phys. (GB), vol.48, no.6, p.1209-19 (20 April 1983).
The infrared spectrum of H_3SiI in the 800-1050 cm^{-1} region has been recorded with a resolution of 0.04 cm^{-1} and rotationally analysed. Features related to the Fermi resonance between ν_5 and $\nu_3+\nu_6$ and to the Coriolis x, y resonance between ν_2 and ν_5 have been explained, and a set of vibration-rotation parameters for the three bands has been determined by least-squares calculations, $\sigma(J, K)=9.4\times10^{-3}$ cm^{-1}. The Fermi resonance matrix element $|W_{356}|$ is found to be 3.7859(7) cm^{-1} and the vibrational frequencies are $\nu_2{}^0=904.551(1)$, $\nu_5{}^0=941.0746(8)$ and $(\nu_3+\nu_6)^0=953.688(3)$ cm^{-1}. The anharmonicity constant, $x_{36}=-1.745(9)$ cm^{-1}, has been determined. Comparison is made with $\nu_2/\nu_5/\nu_3+\nu_6$ of H_3SiCl, H_3SiBr and H_3GeBr. (15 refs.)

70875 Excitation and relaxation of the ν_3 vibration of the OsO_4 molecule in a low-temperature xenon matrix. A.V.Evseev, N.P.Furzikov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.261-5 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.443-9 (Sept. 1982). [received: May 1983]
OsO_4 molecules in a Xe matrix at $T=9$K and concentrations of 1/400 and 1/800 have been excited to the level $\nu_3=1$ by pulsed IR radiation in resonance with the ν_3 vibration with a frequency of 956 cm^{-1}. Significant multiphoton absorption of the IR radiation was not detected. The IR-IR double resonance method has been used to record the absorption spectrum of vibrationally excited molecules; the spectrum has maxima at frequencies of 949.5 and 946.0 cm^{-1}. The first of these corresponds to the transition $\nu_3=1\rightarrow\nu_3=2$ and the second to a presumably mixed vibrational-librational transition. The measured relaxation time of the level $\nu_3=1$ is 90±35 nsec. (10 refs.)

70876 Studies of isolated GeH stretching frequencies. I. Data, assignments and effects of conformation. D.C.McKean, I.Torto, M.W.Mackenzie, A.R.Morrisson (Dept. of Chem., Univ. of Aberdeen, Aberdeen, Scotland).
Spectrochim. Acta Part A (GB), vol.39A, no.5, p.387-98 (1983).
Isolated GeH stretching frequencies are reported or derived from earlier work for 51 substituted germanes in the gas phase, the substituents including Me, Et, i-Pr, CF_3, Ph, CN, C_2H and X=F, Cl, Br, I. In a number of cases, very small positive stretch-stretch interaction force constants are obtained which reflect the virtual decoupling of bond stretching motions in GeH_3 or GeH_2 groups where the bonds differ but slightly in strength. This may be described as 'local mode' behaviour, in the fundamental region. β-effects of Me, X and lone pairs of electrons are found which produce conformational variations in ν^{is}GeH comparable with those found in carbon analogues. These may be used inter alia to study conformer abundancies. Solid state spectra of GeH_3NCO and GeH_3NCS suggest that both of these have non-linear skeletons in this phase. (53 refs.)

70877 Studies of isolated GeH stretching frequencies. II. Substituent and inductive effects. D.C.McKean, I.Torto, M.W.Mackenzie (Dept. of Chem., Univ. of Aberdeen, Aberdeen, Scotland).
Spectrochim. Acta Part A (GB), vol.39A, no.5, p.399-408 (1983).
For pt.I see ibid., vol.39a, no.5, p.387 (1983). ν^{is}GeH data from the preceding paper are examined for the additivity of substituent effects and for correlation with Taft σ^* values. It is essential to correct for conformational variations in ν^{is}GeH and the evidence indicates that gas based values are preferable to condensed phase ones. α effects of Cl, Me, Et, i-Pr are roughly additive, but successive fluorination increases the increase in νGeH, whereas for other groups effects diminish with further substitution. For alkyl germanes and GeH_4. ν^{is}GeH correlates well with $\Sigma\sigma^*$ according to $\nu=2037+47\ \Sigma\sigma^*$, but data for all other substituents are incompatible and no single correlation is possible, in contrast to earlier findings in this field. Possible reasons for the very different behaviour of alkyl [+1] groups and electronegative [−1] ones are considered. Attempts to evaluate $d_\pi-p_\pi$ bonding contributions from νGeH data should be abandoned. (12 refs.)

70878 Vibrational spectroscopic studies on some 2-substituted 1,3-dithia-2-phospha- and 2-arsa-cyclopentanes. G.Davidson, K.P.Ewer (Dept. of Chem., Univ. of Nottingham, Nottingham, England).
Spectrochim. Acta Part A (GB), vol.39A, no.5, p.419-28 (1983).
Infrared and Raman spectra are reported for dithiaphosphacyclopentanes ($(CH_2)_2S_2E.X$), where E=P,X=Cl, OMe, SMe, NMe_2 or Ph; and E=As, X=Cl, I or NMe_2. Assignments of skeletal modes are made in each case assuming a molecular symmetry of C_s. Internal modes of X can be assigned under the appropriate 'local' symmetry. The skeletal mode assignments for E=P and As are compared, showing that many of them are surprisingly insensitive to changing the ring atom. (21 refs.)

70879 Matrix isolation infrared spectra of methylacetate. I. Monomer and dimer absorptions in argon. G.Maes (Dept. of Chem., Univ. of Leuven, Heverlee, Belgium).
Spectrosc. Lett. (USA), vol.16, no.4, p.311-24 (1983).
The infrared spectrum of methyl acetate is presented in argon matrices at 12K. An assignment of monomer and dimer absorptions is proposed. The ester molecules are believed to be H-bonded in the dimer system. (29 refs.)

70880 Franck-Condon effect in resonance Raman scattering of TCNQ-radical. The excitation profiles of 336 cm^{-1} and 2192 cm^{-1} fundamentals. M.Pawlikowski (Inst. of Chem., Jagellonian Univ., Cracow, Poland).
Acta Phys. Pol. A (Poland), vol.A63, no.4, p.547-50 (April 1983).
Simple model based on the Franck-Condon principle is used to reproduce the absorption spectrum and excitation profiles of totally symmetric vibrations of TCNQ-radical. The excitation profiles of 336 cm^{-1} (C=C ring stretch+-C=C wing stretch) and 2192 cm^{-1} (C≡N stretch) fundamentals are quantitatively analyzed within $^2B_{3g}\rightarrow{}^2B_{1u}$ electronic absorption band. This analysis provides the estimation for the shifts in vibrational equilibrium position between $^2B_{3g}$ and $^2B_{1u}$ electronic states. (11 refs.)

70881 Spectroscopic studies of the v_2 mode of methyl iodide by Raman spectroscopy. F.G.Baglin, H.Versmold (Phys. Chem., Univ. of Dortmund, Dortmund, Germany).
Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.656-7 (29 April 1983).
Polarized Raman studies of the ν_2 mode in methyl iodide at 1 and 1600 bar have confirmed, through an independent route, the results previously found by isotopic-dilution studies. By using a cubic-close-packed approximation of the liquid state and a $1/r^6$ interaction potential for dipolar dephasing between molecules, the data may be reconciled. This result is interpreted to be strong evidence for the dominance of the intermolecular transition-dipole dephasing mechanism. (8 refs.)

70882 Jahn-Teller effect and resonance Raman spectra of highly spin-degenerate molecules with application to $FeBr_4{}^-$. M.T.Bourgeois, M.Jacon (Lab. de Recherches Optiques, Faculte des Sci. de Reims, Reims, France).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.107-13 (6 May 1983).
Gives a model calculation of the resonance Raman amplitude of spin-degenerate molecules that are subject to Jahn-Teller distortion. The method is applied to the resonance Raman excitation profiles of the $\nu_3(t_2)$ and $\nu_1(a_{1g})$ modes of $FeBr_4{}^-$. (11 refs.)

70883 Determination of A_0 and D_K for CD_3I from the ν_4 Raman and IR bands. C.Poulsen, S.Brodersen (Dept. of Chem., Univ. of Aarhus, Aarhus, Denmark).
J. Raman Spectrosc. (GB), vol.14, no.2, p.77-82 (April 1983).
The ν_4 Raman band of CD_3I has been recorded at a resolution of 0.28 cm^{-1}. A weighted least-squares analysis, including data from the ν_4 infrared band recorded by Peterson and Edwards (1971), gave $A_0=2.59608\pm0.00010$ cm^{-1} and $D_K=(1.98\pm0.10)\times10^{-5}$ cm^{-1} in addition to values for ν_0, $(A\zeta)_4$, ΔA and ΔB. The ν_4 state is essentially unperturbed. Using literature values for α^A constants, A_e was calculated as 2.6200 ± 0.0008 cm^{-1}, indicating a value of $r_e=1.03192\pm0.00015$ Å for the distance of the deuterium atoms from the figure axis. (23 refs.)

70884 Time-resolved resonance Raman study of transient benzooxazolinic merocyanines. J.L.Albert, J.Aubard, J.E.Dubois (Inst. de Topologie et de Dynamique des Systems, Univ. Paris VII, Paris, France).
J. Raman Spectrosc. (GB), vol.14, no.2, p.83-6 (April 1983).
The time-resolved resonance Raman spectrum (excitation: 532 nm, 30 ns laser pulse; optical multichannel detection) of the short-lived species generated by UV flash irradiation of a benzooxazolinic spiropyran in toluene or benzene, has been obtained. The CW resonance Raman spectrum of a related permanent benzooxazolinic merocyanine closely resembles the spectrum of the transient species. A tentative assignment of the Raman bands is proposed in order to characterize the bonds directly involved in the π-electron delocalization of the merocyanines. (13 refs.)

70885 Vibrational spectra of bromocyclopropane. C.J.Wurrey, R.J.Berry, Y.Y.Yeh (Dept. of Chem., Univ. of Missouri, Kansas City, MO, USA), T.S.Little, V.F.Kalasinsky.
J. Raman Spectrosc. (GB), vol.14, no.2, p.87-92 (April 1983).
Fourier transform infrared spectra of bromocyclopropane at a resolution of 0.5 cm^{-1} have been recorded as well as liquid phase infrared spectra of this molecule from 4000-400 cm^{-1}. For the first time, gas phase Raman spectra and solid phase infrared spectra of bromocyclopropane have been obtained. By combining all of the spectral data available it has been possible to assign all 21 normal modes of vibration of bromocyclopropane (as well as several overtones and combination bands) with a high degree of confidence. This proposed assignment is in excellent agreement with assignments for similar molecules and with anticipated cyclopropyl group frequencies. (13 refs.)

70886 Applications of four-channel Raman difference spectroscopy to studies in hydrogen-bonded systems. H.Takahashi, B.P.Asthana, W.Hafner, W.Kiefer (Phys. Inst., Univ. Bayreuth, Bayreuth, Germany).
J. Raman Spectrosc. (GB), vol.14, no.2, p.102-5 (April 1983).
The authors report on some potential applications and advantages of the four-channel Raman detection technique developed recently at their laboratory. The capability of recording four different Raman signals simultaneously and processing them electronically by scaling of each signal in order to obtain a desired linear combination, has been fully exploited. The simultaneous measurement of $I_\parallel$ and $I_\perp$ of the Raman spectra of pyridine and a mixture of pyridine+methanol, thus allows one to derive the isotropic Raman bandwidths of ν_1 and ν_{8b} vibrations in the hydrogen-bonded species $C_5H_5N...HOCH_3$ and at the same time very small frequency shifts of vibrations of the non hydrogen-bonded pyridine (in mixture) as compared to pure pyridine. The smallest shift that could be measured was 0.045 cm^{-1}. It has been demonstrated that four-channel Raman difference spectroscopy has a distinct advantage for studying the vibrations of complex systems such as a hydrogen-bonded species. (11 refs.)

70887 Coherent anti-Stokes Raman spectra of isoalloxazines. F.Muller, J.Vervoort, J.Lee, M.Horowitz, L.A.Carreira (Univ. of Georgia, Athens, GA, USA).
J. Raman Spectrosc. (GB), vol.14, no.2, p.106-17 (April 1983).
Coherent anti-Stokes Raman spectra (1700-1100 cm^{-1}) of 7,8-dimethyl-10-tetraacetylisoalloxazine (tetraacetylriboflavin) in chloroform and several other

solvents of higher polarity and proton availability are reported. Solvent polarity has no influence on either the intensities or frequencies of the Raman modes, whereas the influence of protic solvents is more marked. As well as altering the effective mass of the particular atoms in the isoalloxazine involved, hydrogen bonding is known to change the bond hybridization throughout the entire ring system. A similarly mild electronic perturbation can be produced by changing the methyl substitution on the benzene subnucleus of the isoalloxazine, and this is shown to produce significant changes in the Raman spectrum. Isotopic substitution with ^{13}C and ^{15}N is used to mimic the effective mass changes that would occur on hydrogen bonding. For the model compounds in chloroform, the effect of isotopic substitution on some modes is different from that reported for the same substitution in riboflavin bound to riboflavin binding protein. Frequencies of the prominent bands in all spectra were determined by lineshape analysis. On the basis of these results a tentative interpretation is made of the changes that occur in the Raman spectra of flavins when they bind to flavoproteins. (30 refs.)

70888 UV-excited resonance Raman spectra of methyl orange and its complex with cetyltrimethylammonium bromide. H.Lee, K.Machida (Faculty of Pharmaceutical Sci., Kyoto Univ., Kyoto, Japan), A.Kuwae, I.Harada.
J. Raman Spectrosc. (GB), vol.14, no.2, p.126-9 (April 1983).
Resonance Raman spectra of methyl orange and its ring-deuterated and ^{15}N-azo derivatives were measured with the excitation line at 350.7 nm of a Kr^+ laser, and the spectral changes on the complex formation between the dye and cetyltrimethylammonium bromide were studied. In the presence, as well as the absence, of the surfactant, the UV-excited resonance Raman spectrum of each isotope of methyl orange is appreciably different from the corresponding spectrum excited with the Ar^+ 488.0 nm line. The UV-excited spectrum of the pure aqueous solution of the dye is attributed to the non-hydrated monomeric species of the dye anion responsible for the absorption band around 420 nm. The spectral pattern between 1500 and 1300 cm^{-1} of the mixed solution of the dye and the surfactant changes in two steps on increase of the surfactant concentration in accordance with the change of the absorption spectrum in the UV-visible region due to the formation of micelles. The UV-excited resonance Raman spectra of acidic solutions of the isotopic methyl orange zwitterions were also measured. By combining the data relating to the effect of pH and the concentration of the surfactant, the N-N stretching frequency in the Raman spectrum was shown to be correlated closely with the π-π^* transition frequency in the absorption spectrum. (10 refs.)

70889 Vibrational spectra and analysis of Te_6^{4+}, a trigonal-prismatic cluster cation. R.C.Burns, R.J.Gillespie (Dept. of Chem., McMaster Univ., Hamilton, Ontario, Canada).
Spectrochim. Acta Part A (GB), vol.39A, no.5, p.439-47 (1983).
Raman and infrared spectra have been recorded on a number of compounds of the Te_6^{4+} cation, and assignments have been made on the basis of a trigonal-prismatic geometry with D_{3h} symmetry. A vibrational analysis has been carried out using a modified valence force field, giving Te-Te stretching force constants of 1.13 and 0.93/0.64 mdyn $Å^{-1}$ for the two non-equivalent bonds of the trigonal prism. Comparisons are made with data for other species which have Te-Te bonds. The force constants for Te_6^{4+} are consistent with the bonding models that have been proposed for this species. (18 refs.)

33.20K Visible spectra

70890 The electronic absorption spectrum of I-C≡C-C≡C-I^+ in a Ne matrix. S.Leutwyler, J.P.Maier, U.Spittel (Phys.-Chem. Inst., Univ. Basel, Basel, Switzerland).
Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.645-8 (29 April 1983).
The optical absorption spectrum of diiododiacetylene cation was obtained in a 4.5K Ne matrix in the wavelength range 2800-9000 Å. The $\tilde{A}^2\Pi_{3/2,u} \leftarrow \tilde{X}^2\Pi_{3/2,g}$ transition was observed and vibrationally analyzed. (13 refs.)

70891 Rotational analysis of the $^2B_1$ ($K'=0$)$\leftarrow$$^2A_1$ ($K''=1$) bands with $\nu_2'=6$, 7 and 10 in the excitation spectrum of NO_2. S.Takezawa (Gunma Univ., Showamachi, Gunma, Japan), N.Sugimoto, N.Takeuchi.
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.77-80 (6 May 1983).
The rotational structure of the $^2B_1$ state of NO_2 is analyzed by means of the time-gated excitation spectrum, monitored at the $^3\nu_2$ band. The band origins ν_0 and the rotational constants are evaluated from the observed data: $\nu_0=20204.86$ cm^{-1}, $\bar{B}'=0.374$ for $\nu'=6$; $\nu_0=21104.49$ cm^{-1}, $\bar{B}'=0.374$ cm^{-1} for $\nu'=7$, and $\nu_0=23791.36$ cm^{-1}, $\bar{B}'=0.361$ for $\nu'=10$. (7 refs.)

70892 Spectroscopy of naphthalene in simple molecular liquids. F.Li, J.Lee, E.R.Bernstein (Dept. of Chem., Colorado State Univ., Fort Collins, CO, USA).
J. Phys. Chem. (USA), vol.87, no.7, p.1175-80 (31 March 1983).
Optical spectra of the first excited singlet state ($1B_{3u}$) of naphthalene in cryogenic molecular hydrocarbon alkane and alkene liquids (CH_4, C_2H_4, C_2H_6, C_3H_6, C_3H_8, 1-C_4H_8) have been obtained and are discussed in terms of the solute-solvent intermolecular interaction. Data include gas-to-liquid shifts, Frank-Condon shifts, line widths for absorption and emission and their temperature dependences. Naphthalene line widths and their temperature dependences and Franck-Condon shifts are smaller than those found for benzene but the gas-to-liquid shifts for both systems are quite similar. Based on these results and the comparison with similar benzene data, the ground- and excited-state Lennard-Jones type potential curves for naphthalene-solvent interactions can be generated. The main conclusions are that naphthalene has a stronger interaction with the solvent than does benzene, the interaction scales with solvent polarizability, and the change in cavity radius upon excitation is greater for benzene than for naphthalene. Lifetime data have also been obtained for the naphthalene fluorescence. At low temperature, the liquid-state lifetime for fluorescence is roughly the same as that found in the low-pressure gas (~300 ns). A small temperature dependence is characterized for these low-concentration solutions leading to an activation energy for naphthalene collision-induced intersystem crossing of ~100 cm^{-1}. The excimer formation and monomer regeneration mechanism reported for benzene is also observed in naphthalene C_3H_6 and C_3H_8 solutions but it is of much less importance to the overall kinetics. (22 refs.)

70893 Spectroscopic studies of toluene in simple molecular liquids. J.Lee, F.Li, E.R.Bernstein (Dept. of Chem., Colorado State Univ., Fort Collins, CO, USA).
J. Phys. Chem. (USA), vol.87, no.7, p.1180-3 (31 March 1983).
Absorption and emission spectra and fluorescence lifetimes are reported for the $^1B_1$ state of toluene in a number of simple hydrocarbon solvents (CH_4, C_2H_6, C_3H_8, C_2H_4, C_3H_6, and 1-C_4H_8). Spectroscopic data such as gas-to-liquid shifts, intermolecular Franck-Condon shifts, line widths, and their temperature dependences can be employed to study potentials present in the cryogenic liquid near the equilibrium separation for solvent and solute. Lifetimes as a function of concentration and temperature indicate that toluene excimers do not form, apparently due to steric hindrance. The results for toluene are compared and contrasted to those of benzene. The intermolecular interactions are nearly identical for the two systems, suggesting that polarizabilities and not dipole moments are important for C_nH_m solvents and hydrocarbon probe systems. Toluene relaxation kinetics and their temperature dependences are discussed. (11 refs.)

70894 Visible and ultraviolet absorption spectrum of UCl_6 dissolved in liquid Xe. W.B.II.Maier, R.F.Holland, W.H.Beattie (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Spectrosc. Lett. (USA), vol.16, no.3, p.233-8 (1983).
The visible and ultraviolet absorption spectrum of UCl_6 dissolved in liquid xenon is measured. Some structure is observed, and the absorptions extend into the red. (9 refs.)

33.20L Ultraviolet spectra

70895 The UV spectrum of ^{18}OD. M.Nuss, K.-H.Gericke, F.J.Comes (Inst. fur Phys. und Theoretische Chem., Frankfurt, Germany), W.A.Guillory.
J. Mol. Spectrosc. (USA), vol.98, no.1, p.154-60 (March 1983).
The combined high-resolution ultraviolet (uv) absorption spectrum of ^{16}OD and ^{18}OD was obtained. State selective measurements of the transitions from the electronic ground state to the first excited electronic state, $\tilde{A}^2\Sigma^+ \leftarrow \tilde{X}^2\Pi$, in the 0-0 vibronic band were performed by means of a narrow bandwidth dye laser system. Evaluation of these transition frequencies in wave-numbers yielded molecular constants as well as rotational term values for each of the isotopic species. A computer program based on a linearized least-squares procedure was used to determine the molecular constants and term values. The term value formulas which were employed for this purpose, take into account the Λ splitting and the centrifugal distortion of the diatomic species. The transitions, recalculated from the semiempirically determined term values agree with the measured absorption lines to better than 0.1 cm^{-1}. The following molecular constants are reported: B, D, H, the rotational constants of the $^2\Pi$ and $^2\Sigma^+$ states; O_0, P_0, Q_0, the constants of the Λ splitting of the $^2\Pi$ state; A and A_j; the constants of the spin-orbit coupling of the $^2\Pi$ state; and γ_0, the constant of the ρ doubling of the $^2\Sigma^+$ state. Furthermore, term values up to J'' and J' of 25.5 and the corresponding UV transitions are given. (13 refs.)

70896 Extensive study of the $1_g(^3P_2)$ ion pair state of I_2. J.P.Perrot, M.Broyer, J.Chevaleyre, B.Femelat (Lab. de Spectrometrie Ionique et Moleculaire, Univ. Lyon, Villeurbanne, France).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.161-7 (March 1983).
Presents extensive spectroscopic study of the $1_g(^3P_2)$ ion pair state of I_2, recently observed and assigned. The results lead to a definitive vibrational numbering that changes by −2 the former v numbering by King et al. (Chem. Phys. 56, 145-156 (1981)). Greatly improved spectroscopic constants have been deduced for the $1_g(^3P_2)$ state as well as for the formerly best known $O_g^+(^3P_2)$ state. (19 refs.)

33.20N Vacuum ultraviolet spectra

70897 Spectroscopic investigation of the electronic structure of the chlorine molecule in the VUV. T.Moeller, B.Jordan, P.Gurtler, G.Zimmerer (II. Inst. fur Experimentalphys., Univ. Hamburg, Hamburg, Germany), D.Haaks, J.le Calve, M.-C.Castex.
Chem. Phys. (Netherlands), vol.76, no.2, p.295-306 (15 April 1983).
Vacuum ultraviolet absorption spectroscopy and fluorescence analysis under selective optical excitation have been combined to deduce the electronic structure of Cl_2. Between 73000 and 81000 cm^{-1} five bound electronic states could be analysed. Some of them are affected by pronounced Rydberg-valence mixing. Especially the $1^1\Sigma_u^+$ state clearly yields a double-well structure which results from an avoided crossing between an ionic valence and a Rydberg

state. The double-well structure is responsible for an irregular vibrational sequence between 73000 and 74500 cm^{-1} which either prevented an analysis in earlier investigations or lead to wrong assignments. The FC factors of the $1^1\Sigma_u{}^+$ fluorescence with its bound-bound and bound-free contributions between $\approx$73000 and 50000 cm^{-1} are also severely affected by the double-well structure. The results are compared with the first ab initio calculations of the electronic structure of Cl_2. In general, excellent agreement is found. (27 refs.)

70898 The vacuum ultraviolet absorption spectrum of SiO in rare gas matrices. J.Hormes, M.Sauer, R.Scullman (Phys. Inst., Univ. Bonn, Bonn, Germany).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.1-19 (March 1983).
The vacuum ultraviolet absorption spectrum of the SiO molecule in four rare gas matrices was investigated using the 2.5-GeV synchrotron in Bonn as a continuum light source. Three different vibrational progressions of bands are observed in the wavelength region 1050-2500 Å. They are interpreted as corresponding to bands of the $A^1\Pi$-$X^1\Sigma^+$, $E^1\Sigma^+$-$X^1\Sigma^+$, and $G^1\Pi$-$X^1\Sigma^+$ systems of gas phase SiO. Additional unclassified absorption lines may possibly originate from transitions from the ground state to Rydberg states. (25 refs.)

33.20R X-ray spectra

70899 X-ray absorption spectra of water and ammonia molecules. V.N.Akimov, A.S.Vinoradov, T.M.Zimkina.
Opt. & Spectrosc. (USA), vol.53, no.3, p.280-2 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.476-9 (Sept. 1982). [received: May 1983]
The *K* absorption spectra of nitrogen and oxygen atoms in NH_3 and H_2O molecules were investigated with an instrumental resolution of ~0.2 and 0.5 eV. The fine structure of the spectra was identified as the result of electronic transitions to orbitals of the valence-Rydberg and Rydberg types by comparison with data on VUV spectra and with the results of theoretical calculations. Within the framework of the combined-atom model, the *K*-absorption spectra of isoelectronic series H_2O-NH_3-CH_4-Ne were compared, and a good correlation between the structures of these spectra was noted. The values 0.6 and 0.8 eV were, respectively, obtained in the NH_3 and H_2O molecules for the energy splitting value of the orbitals corresponding to the 3*p* orbitals of the Ne atom in the combined-atom model. (16 refs.)

33.25 NUCLEAR MAGNETIC RESONANCE AND RELAXATION; NUCLEAR QUADRUPOLE RESONANCE (NQR)

70900 Carbon-13 chemical shifts as a probe for conformational and electronic effects in alkyl vinyl ethers. J.G.K.Webb, D.K.Yung (Coll. of Pharmacy, Dalhousie Univ., Halifax, NS, Canada).
Can. J. Chem. (Canada), vol.61, no.3, p.488-93 (March 1983).
The principle of additivity of substituent chemical shifts (SCS) is applied to the carbon-13 chemical shifts of β carbons (δ_β) in a number of 1,1-disubstituted ethylenes and propenes, which includes some α-substituted alkyl vinyl ethers. An additivity relationship is observed for 34 compounds that indicates an independent polarization mechanism across the double bond for each geminal substituent. Positive deviations from additivity are observed for compounds bearing bulky substituents. The magnitude of deviations is taken as an indication of the severity of steric interactions among substituents. Reductions in efficiency of transmission of substituent effects in ring substituted α-phenyl alkyl vinyl ethers, relative to para-substituted styrenes, are interpreted as the result of a variable dihedral angle between the ring and vinyl group. An explanation of the relationship between conformation and transmission of substituent effects is presented as an alternative to existing views. An angular dependence of π-polarization and resonance effects is consistent with the chemical shift data. (38 refs.)

70901 ^{23}Na nuclear magnetic resonance linewidth studies of sodium tetraethylaluminate: complexes with hexamethylphosphoramide in benzene. J.H.Medley, E.S.Mooberry, M.C.Day (Dept. of Chem., Louisiana State Univ., Baton Rouge, LA, USA).
Can. J. Chem. (Canada), vol.61, no.3, p.558-61 (March 1983).
The linewidth of the ^{23}Na resonance in sodium tetraethylaluminate in benzene has been measured as a function of the ratio of [donor]:[Na^+] using the strong complexing agent hexamethylphosphoramide. In this system changes in the sodium linewidth arise primarily from changes in the nuclear quadrupole relaxation at the sodium nucleus which in turn arise from changes in the electric field gradient. As the ratio of hexamethylphosphoramide to sodium ion is increased up to 3:1 the ^{23}Na linewidth progressively decreases due to an increase in cation-anion distance in the ion pair. After a ratio of 4:1 is reached, essentially no linewidth change is noted, indicating a stable solvation number of 4 for hexamethylphosphoramide. The results of this study indicate that this is a new and promising approach to the determination of solvation numbers of the sodium ion. (29 refs.)

70902 On the structure of water NMR spectra in membranes. V.V.Mank, N.I.Lebovka (A.V. Dumanski Inst. of Colloid & Water Chem., Acad. of Sci., Kiev, Ukrainian SSR).
Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.626-30 (29 April 1983).
Proton magnetic resonance spectra of water in magnetically non-uniform heterogeneous systems is analysed. It is shown that the multiple structure of spectra for different heterogeneous objects, including membranes, may be determined by the effects of magnetic inhomogeneity providing the ordered distribution for water-filled pores of anisotropic form exists. (29 refs.)

70903 ^{13}C and ^{1}H NMR analysis of isotopically labeled Benzo[*a*]pyrenes. C.J.Unkefer, R.E.London, T.W.Whaley, G.H.Daub (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Am. Chem. Soc. (USA), vol.105, no.4, p.733-5 (23 Feb. 1983).
^{13}C AND ^{1}H NMR spectra of each of the 12 isotopomers of benzo[*a*]pyrene specifically labeled with carbon-13 at a methine position have been obtained. These studies lead to reassignment of 11 of the 20 ^{13}C resonances of benzo[*a*]pyrene, and to unambiguous ^{1}H assignments. $^1J_{CC}$ values were found to follow Hansen's rule, although the specific parameterization varied significantly depending on the source of the bond-length data. The optimum fit for the methine carbons was determined to be $^1J_{CC}=-143l+257$; for coupling between methine and quaternary carbons, $^1J_{CC}=-119l+227$. Vicinal couplings between ^{13}C atoms do not show a significant correlation with the bond order of the central bond in the vicinal coupling pathway; however, coupling between vicinal carbons which are trans along the periphery of the ring system (class I) have a mean of 5.45 Hz compared with the vicinal trans coupling through the ring (class II) with a mean of 3.06 Hz. (23 refs.)

70904 Chemical shift anisotropy and second-sphere hydrogen bonding in cobalt (III) complexes. S.C.F.Au-Yeung, D.R.Eaton (Dept. of Chem., McMaster Univ., Hamilton, Ontario, Canada).
J. Magn. Resonance (USA), vol.52, no.3, p.351-65 (May 1983).
The linewidths of the ^{59}Co NMR resonances of 22 Co(III) complexes were measured at fields of 2.114, 5.872, and 9.395 T. The linewidths for octahedral complexes show no field dependence. Less symmetric compounds show differences in linewidth of as much as 10 kHz between the highest field and the lowest field. The linewidth changes parallel the chemical shift anisotropies calculated from optical absorption spectral data. For complexes with high symmetry the increase in width is proportional to the square of the field strength. For complexes of lower symmetry, plots against field squared show a pronounced curvature. If the increase in linewidth is calculated from the chemical shift anisotropies obtained from optical data (or from single-crystal measurements reported in the literature) and correlation times derived from quadrupole coupling constants the calculated increases in width are more than two orders of magnitude smaller than the observed increases. Correlation times of the order 10^{-9} to 10^{-10} sec rather than the accepted 10^{-11} sec for rotational correlation times are required to fit the data. It is suggested that these long correlation times are associated with the lifetimes of hydrogen bonds with second-sphere solvent molecules. (44 refs.)

70905 The solvent and field dependence of ^{59}Co NMR linewidths. S.C.F.Au-Yeung, D.R.Eaton (Dept. of Chem., McMaster Univ., Hamilton, Ontario, Canada).
J. Magn. Resonance (USA), vol.52, no.3, p.366-73 (May 1983).
The chemical shifts and linewidths of the ^{59}Co resonances of six cobalt (III) complexes of low symmetry are discussed. Measurements at three different field strengths and in a variety of solvents are reported. Both the linewidths and their field dependence differ markedly in different solvents. The results are correlated with the hydrogen bonding abilities of the solvents. The field-independent part of the linewidth is attributed to quadrupolar relaxation and it is inferred that both the quadrupolar coupling constant and the correlation time vary with solvent. The field-dependent contribution is substantial in strongly hydrogen bonding solvents and small in weakly hydrogen bonding solvents indicating that the field dependence of ^{59}Co relaxation times is associated with second coordination sphere interactions. (15 refs.)

70906 ^{13}C isotope effects on the parameters of proton magnetic resonance spectra of benzene. V.A.Chertkov, N.M.Sergeyev (Dept. of Chem., Moscow State Univ., Moscow, USSR).
J. Magn. Resonance (USA), vol.52, no.3, p.400-6 (May 1983).
The proton-coupled ^{13}C NMR spectra and the ^{13}C satellites in the ^{1}H NMR spectra of commercial benzene containing about 6.6% of benzene-1-^{13}C were measured and analyzed using the iterative LACX program; 271 lines were assigned and used in the calculations (105 lines from the proton-coupled ^{13}C NMR spectra, 118 lines from outer satellites, and 48 lines from inner satellites in the ^{1}H NMR spectra). The exact values of the ^{13}C-^{1}H coupling constants were obtained with the standard deviations not exceeding 0.004 Hz. The ^{12}C/^{13}C-induced proton isotope chemical shifts were found to be $^1\Delta=2.44$; $^2\Delta=1.34$; $^3\Delta=0.51$; and $^4\Delta=0.33$ (in parts per billion). The ^{12}C/^{13}C- induced isotope effects on the proton-proton coupling constants do not exceed 0.005 Hz. (17 refs.)

70907 A numerical calculation of the NMR lineshape using the finite difference method. J.I.Kaplan, K.V.Vasavada (Dept. of Phys., Indiana Purdue Univ., Indianapolis, IN, USA).
J. Magn. Resonance (USA), vol.52, no.3, p.475-9 (May 1983).
A procedure is given for calculating the NMR lineshape of a cluster of spins imbedded in a molecule which is rotating with free or restricted motion. It is shown that for the isotropic diffusion model (assuming a correlation time τ_c such that $1/\tau_c \gg H_{DD}/\hbar$ where H_{DD} is the dipole interaction) the line shape is Lorentzian as expected and has a width equal to that obtained from a standard T_2 calculation using the appropriate autocorrelation function. For τ_c which do not satisfy this condition the lineshape is no longer Lorentzian, and an example for this condition is shown. The usefulness of the procedure lies in obtaining lineshapes for systems whose motion is too complex for an autocorrelation function to be obtained unambiguously. (9 refs.)

70908 Carbon-13 spin-lattice relaxation mechanisms for the t-butyl cation in superacid. Importance of chemical shift anisotropy to the relaxation of cationic carbons. D.P.Kelly, D.R.Leslie (Dept. of Organic Chem., Univ. of Melbourne, Parkville, Victoria, Australia), R.A.Craig.
J. Magn. Resonance (USA), vol.52, no.3, p.480-91 (May 1983).
The contributions to the spin-lattice relaxation rates of the methyl and cationic carbons of the t-butyl carbocation in superacid were determined from the observed T_1 values at 213K and different field strengths. Chemical shift anisotropy (CSA) contributes 20% to the relaxation rate of the cationic carbon at 14.1 kG and 80% at 58.8 kG. The large contribution from CSA is due both to the shielding anisotropy (450 ppm) and to $\tau_{eff}{}^{CSA} > \tau_{eff}{}^{DD}$. This anisotropy is larger than observed previously in neutral molecules. Most of the remaining contribution is due to intramolecular C-H dipole-dipole interactions as no spin-rotation contribution was detected. The spin-rotation mechanism also makes no contribution to the relaxation of the methyl carbons, which is dominated by similar dipole-dipole interactions. Application of the Woessner equations (1969) to this anisotropically reorienting species provides the ratio of the diffusion constants $\rho=D_\parallel/D_\perp$ but not the internal methyl diffusion coefficient D_i. The calculated ratio is sensitive to methyl group geometry and it is concluded that the C^+-C-H angle is closer to 113 than 109.47°. (45 refs.)

70909 Effects of cross relaxation on the analysis of T_1 data in paramagnetic proteins. E.Sletten, J.T.Jackson, P.D.Burns, G.N.La Mar (Dept. of Chem., Univ. of California, Davis, CA, USA).
J. Magn. Resonance (USA), vol.52, no.3, p.492-6 (May 1983).
Several paramagnetic proteins with molecular weights in the range 10000-20000 are presently being studied by ^{1}H NMR. Semilogarithmic T_1 plots for all these proteins exhibit pronounced curvature for at least several of the resonances. The authors have been studying the Gd^{3+}-induced paramagnetic relaxation of the low spin ($S=1/2$) horse heart ferricytochrome *c* (cyto. *c*). Specific Gd^{3+} binding to the protein results in differential broadening of various resonances. These hyperfine shifted resonances arise from the assigned heme, axial methionine, as well as some as yet unassigned probable amino acid protons. Analysis of this Gd^{3+}-induced dipolar relaxation, which varies as the inverse sixth power of the distance to the Gd^{3+}, using the assigned resonances is expected to define a binding site, which in turn can be used to assign new resonances. While the binding site is not yet defined, the studies have produced some interesting observations relevant to the interpretation of such data. (13 refs.)

70910 Variation of NMR chemical shifts induced by $[Fe(CN)_6]^{3-}$. Zhong-Xian Huang, G.R.Moore (Inorganic Chem. Lab., Oxford, England).
J. Magn. Resonance (USA), vol.52, no.3, p.505-10 (May 1983).
Paramagnetic ions are widely used to perturb NMR spectra either to simplify them or to provide specific chemical and biochemical information. One such reagent that has become increasingly important in this respect is $[Fe(CN_6)]^{3-}$. $[Fe(CN)_6]^{3-}$ is a low-spin d^5 ion ($S={}^1/_2$) that causes perturbations to resonance chemical shifts without appreciably affecting linewidths and as a result it has been used extensively to simplify spectra to study ion-pair formation in solution and in a solid, and as a structural probe to obtain conformational parameters. The mechanism of the shift was investigated by the study of ^1H NMR spectra of a variety of aliphatic amines and the quarternary aromatic amine methylviologen (also known as paraquat), and from a study of ^{13}CNMR spectra of trimethyllysine. (22 refs.)

70911 ^{13}C spin-echo modulation through ^{13}C, ^2H spin-spin coupling: elimination of solvent signals and analysis of partially deuterated systems. P.Schmitt, J.R.Wesener, H.Gunther (Fachbereich 8, Univ. of Siegen, Siegen, Germany).
J. Magn. Resonance (USA), vol.52, no.3, p.511-14 (May 1983).
J modulation of spin-echo signals has become a well-known technique, and applications reach from signal assignments in ^{13}C NMR spectroscopy to *J*-resolved two-dimensional ^{13}C spectra. The authors describe a straight-forward extension to deuterated molecules, where they use scalar ^{13}C, ^2H spin-spin coupling to modulate transverse ^{13}C magnetization. These experiments require ^2H decoupling and, for example, a ^{19}F lock channel, since additional ^1H decoupling is desirable in most cases for various reasons (sensitivity enhancement, simplified spectra). Practical applications are the elimination of ^{13}C NMR signals from deuterated solvents and the ^{13}C NMR analysis of mixtures of partially deuterated systems. (7 refs.)

70912 Analytic solution of fourth degree secular equations: $I=3/2$ Zeeman-quadrupole interactions and $I=7/2$ pure quadrupole interaction. R.B.Creel (Dept. of Phys., Univ. of Akron, Akron, OH, USA).
J. Magn. Resonance (USA), vol.52, no.3, p.515-17 (May 1983).
An analytic solution is presented for any fourth degree secular equation arising from a traceless spin Hamiltonian. The energy levels are derived as functions of the interaction parameters. The solutions are applied to two specific Hamiltonians which generate quartic secular equations; the $I={}^3/_2$ combined Zeeman-quadrupole interactions and the $I={}^7/_2$ pure quadrupole interaction. (7 refs.)

70913 Multipulse techniques to edit ^{13} NMR spectra of deuterated compounds. Useful methods to follow deuterium in biosynthesis. D.M.Doddrell, J.Staunton, E.D.Laue (Univ. Chem. Labs., Univ. of Cambridge, Cambridge, England).
J. Magn. Resonance (USA), vol.52, no.3, p.523-8 (May 1983).
A variety of one-dimensional multipulse techniques have been developed recently to edit ^{13}C NMR spectra into nonprotonated, CH, CH_2, and CH_3 subspectra. These methods rely on controlled precession via the one-bond CH scalar coupling (J_{CH}) and the relative constancy of these values in a complex molecule. However, spin-echo techniques are relatively sensitive to variation in J_{CH} (2,3) when compared with polarization-transfer methods such as DEPT. The authors consider some of the possible spin-echo methods likely to be useful to edit ^{13}C spectra based on one-bond ^{13}C-^2H scalar coupling. These methods are likely to be extremely useful in following the fate of deuterium atoms in biosynthetic and reaction mechanism studies, which involve a high dilution of the deuterium label. (9 refs.)

70914 Proton and carbon-13 nuclear magnetic resonance spectra and INDO study of serotonine, tryptamine and L-tryptophan. S.Biagini, A.Lai, M.Monduzzi, G.Saba (Istituto Chimica Fisica e Industriale, Univ. di Cagliari, Cagliari, Italy).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.4, p.491-6 (April 1983).
An NMR investigation on serotonine, tryptamine and L-tryptophan in aqueous solution is reported. Homonuclear proton coupling constants are compared with those calculated at an INDO level and the results are discussed in terms of different conformations. A deuterium substitution study on serotonine provided information on the couplings of indole and aliphatic protons. Deuterium incorporation rates are shown to correlate with π INDO excess charges. (17 refs.)

70915 Positive temperature coefficient of the iodine quadrupole resonance frequency in ammonium tri-iodide due to reorientation of the ammonium ion. Y.Yoshioka, N.Nakamura, H.Chihara (Dept. of Chemistry, Osaka Univ., Osaka, Japan).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.4, p.497-504 (April 1983).
A large increase in the nuclear quadrupole resonance (NQR) frequency of a terminal iodine atom I_a of the I_3 anion in NH_4I_3 is explained by a simple theory which relates the reorientation of the ammonium ion to a concerted change in the relative weights of the resonance structures of the I_3 anion through formation and scission of the N-H...I_a hydrogen bond. The weight of the structure (I_a^- I-I) oscillates between 0.75 (hydrogen-bonded) and 0.48 (non-bonded) as the NH_4 cation is reoriented. The proton spin-lattice relaxation time was measured between 77 and 240 K; a minimum of 2.45 ms occurs at 80K. The activation energy for ammonium reorientation is 7.53 kJ mol^{-1}. The energy of a hydrogen bond, including the effect of the change in relative weights of I_3, was derived as 5.20 kJ mol^{-1}. (12 refs.)

70916 Pressure dependence of ^1H and ^{19}F chemical shifts in 1,1-difluoroethylene gas and in gaseous mixtures. S.K.Singh (Dept. of Phys., Ravenshaw Coll., Cuttack, India), S.Mohanty.
Mol. Phys. (GB), vol.48, no.6, p.1383-7 (20 April 1983).
The authors have measured the chemical shifts, δ, and 'second virial shielding coefficient', σ_1, for gaseous 1,1-difluoroethylene and its mixture with other gases at varying pressures (~10-45 atmospheres). The δ vs. ρ (density) plot for ^1H and ^{19}F resonances is found to be linear within the pressure range studied. The sign of σ_1 is negative. The influence of perturbers on δ and σ_1 is in the following order: $Xe>SF_6>Kr>SiF_4>CH_4>CF_4$ (spherical top molecules) and $C_2H_6>C_2H_4>HCl>CO_2$ (nonspherical top molecules). These trends are true for polar and nonpolar solutes. (13 refs.)

70917 ^1H NMR and ^{13}C NMR spectra of B-aminothiosulphonic derivatives related to pseudonorthioephedrine. B.Kone, M.Gelbcke (Lab. de Chimie Pharmaceutique Organique et de Bromatologie, Univ. Libre de Bruxelles, Bruxelles, Belgium).
Spectrochim. Acta Part A (GB), vol.39A, no.5, p.409-13 (1983). In French.
A series of β-aminothiosulfonic acids related to nor- and pseudonorthioephedrine (N-CH_3; N-C_2H_5; N-iC_3H_7 acid N-t C_4H_9) has been synthesized. The study of their ^1H-NMR and ^{13}C-NMR spectra allowed the differentiation of them. The substitution by a tertiary butyl group give rise to important modifications and produce an unexpected γ deshielding effect. (32 refs.)

70918 Study of a steric interaction effect in the benzofuran series. J.Belleney, J.Vebrel (Lab. de Chimie Appliquee, Univ. de Franche-Comte, Besancon, France), N.Platzer, F.Theobald.
Spectrochim. Acta Part A (GB), vol.39A, no.5, p.429-38 (1983). In French.
The synthesis of dimethoxypoxycarbonyl-2,3 benzofuran, of its four monomethyl derivatives and of some di- and tri-methyl derivatives allowed the authors to perform their structural analysis by ^{13}C NMR and mass spectrometry. These studies showed the importance of electronic and steric interactions in these compounds. The special properties of the dimethoxycarbonyl-2,3 methyl-4 benzofuran leads one to determine its crystalline structure. (18 refs.)

70919 Carbon-13 nuclear magnetic resonance studies of aspergillomarasmine A anhydroaspergillomarasmine B and of aspergillomarasmine A Ca^{+2} chelate. M.Barbier (CNRS, Gif-sur-Yvette, France).
Spectrosc. Lett. (USA), vol.16, no.4, p.255-65 (1983).
Carbon-13 NMR determinations have been carried out on aspergillomarasmine A, anhydroaspergillomarasmine B, isolated from different species of fungi and comparisons allow the attribution of the signals to all carbon atoms. Changes observed in the spectrum by forming the 1:1 chelate of aspergillomarasmine A and the fact that aspergillomarasmine B cannot give chelates, lead to a proposal for the structure of this complex. (8 refs.)

33.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

70920 Experimental and theoretical study on cation radicals of cyclopropane, cyclobutane and cyclopentane. K.Ohta, H.Nakatsuji (Dept. of Hydrocarbon Chem., Kyoto Univ., Kyoto, Japan), H.Kubodera, T.Shida.
Chem. Phys. (Netherlands), vol.76, no.2, p.271-81 (15 April 1983).
Cation radicals of cycloalkanes have been produced for the first time in γ-irradiated rigid solutions using fluoromethane as a matrix. Observed ESR spectra are analyzed by ab initio MO calculations; molecular geometries of the cations are optimized for several low-lying doublet states by the energy gradient method. Based on the optimized geometry thus determined the hyperfine splitting constants are calculated by the pseudo-orbital theory. Large Jahn-Teller distortions are calculated for the carbon rings and the H-C-H frames of the cation radicals. The distortions are consistent with the nodal picture of singly occupied orbitals. The calculated HFS constants are sensitive to the change in geometry due to a large contribution of spin-delocalization. The average of the calculated proton HFS constants is compatible with the observed ESR spectra which indicates that all the protons of the individual cations have become equivalent owing to the dynamic Jahn-Teller distortion. (28 refs.)

70921 Electron spin resonance studies of radical cations of five-membered heteroaromatics. Furan, thiophene, pyrrole, and related compounds. M.Shiotani, Y.Nagata, M.Tasaki, J.Sohma (Faculty of Engng., Hokkaido Univ., Sapporo, Japan).
J. Phys. Chem. (USA), vol.87, no.7, p.1170-4 (31 March 1983).
Radical cations of several five-membered heteroaromatics (furan, thiophene, pyrrole, 2-methylfuran, 2-methylthiophene, 3-methylthiophene, and 2,5-dimethylfuran) have been detected and identified by ESR studies on solid solutions of the parent molecules in various fluorinated matrices. The matrices used include CCl_3F, SF_6, c-C_6F_{12}, c-$C_6F_{11}CH_3$, and c-C_4F_8. The spin density distribution obtained by the ESR analysis suggests that the unpaired electron resides in the π orbital of $1a_2$ nature for all the radical cations studied. This is consistent with the photoelectron spectra of the parent molecules and with the INDO calculation for the respective cations. Using c-$C_6F_{11}CF_3$ as matrix, we observed well-resolved ESR spectra for 2-methylfuran, 2-methylthiophene, 3-methylthiophene, and 2,5-dimethlyfuran cation radicals. The effect of CH_3 substitution on the spin distribution is discussed. Furthermore, bimolecular reactions between a radical cation and a neutral molecule of furan in a matrix were briefly discussed. (42 refs.)

70922 Metal-nitroxyl interactions. XXIX. EPR studies of spin-labeled copper complexes in frozen solution. S.S.Eaton (Dept. of Chem., Univ. of Colorado, Denver, CO, USA), K.M.More, B.M.Sawant, P.M.Boymel, G.R.Eaton.
J. Magn. Resonance (USA), vol.52, no.3, p.435-49 (May 1983).
Frozen solution EPR spectra have been obtained for 12 spin-labeled copper complexes. A perturbation calculation including both exchange and dipolar interaction was used to simulate the spectra. The distances between the two spins ranged from 7.5 to 13.5 Å. The absolute value of the electron-electron exchange coupling constant ranged from 0 to about 2000×10^{-4} cm^{-1}. (24 refs.)

Simulation of electron spin resonance spectra by fast Fourier transform ....See Entry 72657

33.35 DOUBLE RESONANCES AND OTHER MULTIPLE RESONANCES

70923 Triplet emission from furil in different crystalline environments: optical and ODMR studies. C.J.Sandroff, I.Y.Chan (Dept. of Chem., Brandeis Univ., Waltham, MA, USA).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.60-5 (6 May 1983).
The excited triplet state of furil was examined in single crystals of 4,4'-dibromodiphenyl ether and benzophenone. Phosphorescence and ODMR spectra reveal several distinct emitting species. In both crystals at low temperatures furil is probably trans-planar. In benzophenone at elevated temperatures two emitting furil species transfer energy on a 100 μs time scale. (8 refs.)

70924 The hyperfine structure of akaline-earth monohalide radicals: new methods and new results 1980-1982. W.J.Childs (Argonne Nat. Lab., Argonne, IL, USA).
Comments At. & Mol. Phys. (GB), vol.13, no.1, p.37-50 (1983).
The first observation of the hyperfine structure of a fully isolated alkaline-earth monohalide radical was published in 1980. This review summarizes the various approaches used since then, and outlines the present status of knowledge. Particular attention is given to the contributions of the molecular-beam, laser-RF, double-resonance technique. Sophisticated ab initio calculations are needed for comparison with the large body of high quality data now at hand. (24 refs.)

70925 Transient effects in homonuclear double resonance. G.Tomlinson (IBM Instruments Inc., Danbury, CT, USA).
J. Magn. Resonance (USA), vol.52, no.3, p.374-85 (May 1983).
The effect of transient excitation on homonuclear double resonance spectra of spin 1/2 nuclei is investigated. An analysis is given which accurately describes the experimental results presented. The signal received at the irradiation frequency is experimentally verified to be due to a spin transition and not due to 'decoupler breakthrough'. Stationary states calculated by combining spin and quantized radiation states in the laboratory reference frame are used to facilitate the transition probability calculation. (9 refs.)

70926 Comparison of decoupling and spatial randomization methods for use in editing ^{13}C spectra. M.R.Bendall, D.T.Pegg, D.M.Doddrell (School of Sci., Griffith Univ., Nathan, Queensland, Australia).
J. Magn. Resonance (USA), vol.52, no.3, p.407-23 (May 1983).
Two known spin randomization techniques, which might be used for separating a methylene (CH_2)/quarternary (q) ^{13}C subspectrum into separate CH_2 and q subspectra, are compared. Both techniques utilise the heteronuclear scalar coupling interaction between the carbon and directly bonded proton spins. However, the first technique involves randomization of the ^{13}C spins in the transverse plane of the rotating reference frame as a result of off-resonance ^1H decoupling, whereas the second technique involves randomization of the ^1H spins in three dimensions by a powerful noise-modulated pulse. The latter method is superior in that it is much less sensitive to the nonequivalence of methylene protons. (21 refs.)

70927 Assignment of ^{13}C resonances and ^{13}C, X spin-spin coupling constants via double-quantum coherence. P.Schmitt, H.Gunther (Fachbereich 8, Univ. of Siegen, Siegen, Germany).
J. Magn. Resonance (USA), vol.52, no.3, p.497-9 (May 1983).
The observation of ^{13}C, ^{13}C spin-spin coupling constants in natural abundance is greatly facilitated through the use of the INADEQUATE pulse technique, which allows a suppression of the S_0 magnetization from molecules with only one isolated ^{13}C. The original pulse sequence (1) $90°(x)$-τ-$180°(y)$-τ-$90°(x)$-Δ-$90°(\phi)$, FID contains a very short delay Δ (10 μsec) needed for resetting the radiofrequency pulse. The authors show that Δ can be used to advantage as an additional evolution period t_1' that allows one to select a particular double-quantum coherence which arises during the first part of the INADEQUATE sequence. 33.45 MAGNETO-OPTICAL AND ELECTRO-OPTICAL SPECTRA; DICHROISM

70928 Electrostatic solvent effect on the circular dichroism of the carbonyl $n \to \pi^*$ transition. M.F.Ruiz-Lopez, D.Rinaldi (Lab. de Chimie Theorique, CNRS, Vandoeuvre-les-Nancy, France).
THEOCHEM (Netherlands), vol.10, p.277-81 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The rotatory strength of the $n \to \pi^*$ transition in a simple chiral molecule containing a carbonyl group is computed by means of the CNDO/S technique with the use of configuration interaction. A method is proposed to study the modification by a solvent of both position and intensity of the CD spectrum. The calculations allow to separate solvent effects on the electronic distribution and the nuclear geometry. A detailed analysis of the influence of electronic polarization and geometry perturbations induced by the solvent on the CD spectrum is given. In addition, a reversal of the relative stabilities of some conformers in solution is predicted. (14 refs.)

33.45B Zeeman and Stark effects

70929 Stark effect in azo compounds with long hydrocarbon tail. L.M.Blinov, V.T.Lazareva, S.G.Yudin.
Opt. & Spectrosc. (USA), vol.53, no.3, p.272-6 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.462-8 (Sept. 1982). [received: May 1983]
Spectra of the optical density and the quadratic Stark effect were measured in the 250-420-nm region for azo compounds that have donor [a long hydrocarbon tail $CH_3(CH_2)_{17}O$] and acceptor ($CN, NO_2, COOH$) groups. The differences in the dipole moments $\Delta\mu$ between the ground state and its closest excited state of molecules as well as the corresponding differences in electrical polarizabilities $\Delta\alpha$ are calculated from experimental data. The results are of interest for determination of the degree of orientation of molecules of such compounds in multilayers from measurements of the linear Stark effect. (14 refs.)

33.45C Magnetic circular dichroism

70930 Magnetic circular dichroism studies. LXII. Sign variation in the magnetic circular dichroism spectra of some perimeter symmetric free-base porphyrins. J.D.Keegan, E.Bunnenberg, C.Djerassi (Dept. of Chem., Stanford Univ., Stanford, CA, USA).
Spectrosc. Lett. (USA), vol.16, no.4, p.275-86 (1983).
For pt.LXI see J. Am. Chem. Soc., vol.104, no.16, p.4317 (1982). The MCD bands associated with the four lowest energy electronic transitions of perimeter symmetric porphyrin free-bases have commonly exhibited the 'normal' sign pattern of $-+-+$ in the order of increasing energy. The first known exceptions to this rule, found in a series of tetrakis(o,o'-dihalophenyl)porphyrins, are presented. The sign inversions in the Q bands as well as the normal sign pattern in the Soret bands (overall pattern: $+--+$) can be understood on the basis of Michl's perimeter model (1978). (22 refs.)

33.50 FLUORESCENCE, PHOSPHORESCENCE; RADIATIONLESS TRANSITIONS (INTERSYSTEM CROSSING, INTERNAL CONVERSION)

70931 Influence of the energy transfer between excited molecules on delayed luminescence decay in rigid luminophors. F.Burak (Inst. of Phys., Tech. Univ., Gdansk, Poland).
Acta Phys. Pol. A (Poland), vol.A63, no.4, p.519-29 (April 1983).
An analysis of the kinetics of the processes deactivating singlet states (S) and triplet states (T) in the luminophor emitting phosphorescence (P) and thermally activated delayed fluorescence (EDF) has been carried out. Among the processes causing the deactivation of excited molecules, apart from the monomolecular processes, the action of an intermolecular process of singlet-triplet (S-T) energy transfer has been regarded. The obtained rate of delayed luminescence decay as a function of emitted luminescence intensity has been applied for the description of the experimental rates of delayed luminescence decay of fluoresceine solutions in boric acid glass. (18 refs.)

70932 Rotationally resolved photofragment alignment and the vacuum ultraviolet photodissociation of H_2O. J.P.Simons, A.J.Smith (Dept. of Chem., Univ. of Nottingham, Nottingham, England).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.1-3 (6 May 1983).
The photodissociation of H_2O in the vacuum UV ($\lambda<135$ nm) generates rotationally aligned populations of $OH(A^2\Sigma^+)$ fragments. Measurements of their rotationally resolved fluorescence polarisation following photolysis at 130.4 nm reinforces the suggestion that the vibrational structure in the $\tilde{B}^1A_1 \leftarrow \tilde{X}^1A_1$ continuum is associated with long-lived 'resonances' in the excited state. The low levels of alignment at 121.6 nm reflect a delay in the radiationless transfer out of the quasi-bound $\tilde{D}^1A_1$ Rydberg state initially populated. (16 refs.)

70933 Delayed fluorescence $S_2 \to S_0$ from 4,6,8-trimethylazulene due to homo-triplet-triplet annihilation. D.Klemp, B.Nickel (Abteilung Spektroskopie, Max-Planck-Inst. fur Biophys. Chem., Gottingen, Germany).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.66-71 (6 May 1983).
A delayed fluorescence $S_2 \to S_0$ from the second excited singlet state (S_2) of 4,6,8-trimethylazulene (TMA), resulting from homo-triplet-triplet annihilation $T_1+T_1 \sim\to S_2+S_0$, has been observed. No delayed fluorescence from an upper excimer state of TMA was found. The extrapolated low-temperature triplet lifetime of TMA is $\approx$140 μs. (23 refs.)

70934 Oscillatory continuum emission from Br_2 following vacuum ultraviolet laser excitation. M.MacDonald, R.J.Donovan (Dept. of Chem., Univ. of Edinburgh, Edinburgh, Scotland), M.C.Gower.
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.72-6 (6 May 1983).
Laser-induced fluorescence from Br_2 following excitation at 158 nm (F_2 laser) is reported. The most intense emission features are associated with three bound-free transitions (oscillatory continua) in the region 210-440 nm. Efficient collisional interstate transfer, by SF_6, N_2 and He, is observed and the possibility of constructing an optically pumped Br_2 laser is noted. (12 refs.)

70935 Phosphorescence of *s*-triazine vapor. N.Ohta, M.Fujita, T.Takemura, Y.Shindo, H.Baba (Div. of Chem., Hokkaido Univ., Sapporo, Japan).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.81-4 (6 May 1983).
The phosphorescence of *s*-triazine vapor has been observed by means of time-resolved emission spectroscopy. The phosphorescence spectrum is diffuse with a faint vibronic structure in the shorter-wavelength region. The phosphorescence quantum yield is 3.0×10^{-5} for excitation at the 6_0^2 absorption band of the $S_0 \to S_1$ transition, and the lifetime is 7.1×10^{-6} s. (17 refs.)

70936 Singlet energy transfer from the charge-transfer excited state of tris(2,2'-bipyridine)ruthenium(II) to laser dyes. K.Mandal, T.D.L.Pearson, W.P.Krug, J.N.Demas (Dept. of Chem., Univ. of Virginia, Charlottesville, VA, USA).
J. Am. Chem. Soc. (USA), vol.105, no.4, p.701-7 (23 Feb. 1983).
Efficient singlet energy transfer from the charge-transfer (CT) excited state of $[Ru(bpy)_3]^{2+}$ (bpy=2,2'-bipyridine) to several laser dyes has been demonstrated. The limiting efficiencies of dye singlet state formation are 1.00 which shows the efficiency of formation of the sensitizing state of $[Ru(bpy)_3]^{2+}$ is unity. For most of the dyes in methanol, energy transfer is shown to be predominantly by diffusion-assisted Forster transfer. For Rhodamine 101, however, energy transfer is predominantly by a contact exchange transfer. This result shows that the CT state of the sensitizer has a great deal of singlet character and should be referred to as a spin-orbit state. (31 refs.)

70937 Emission and laser excitation spectra of rotationally cooled cations: $A\sim{}^2\Pi_u \leftrightarrows X\sim{}^2\Pi_g$ band systems of $X(C{\equiv}C)_2X^+$, X=Cl,Br. D.Klapstein, J.P.Maier, L.Misev (Phys.-Chem. Inst., Univ. Basel, Basel, Switzerland).
J. Chem. Phys. (USA), vol.78, no.9, p.5393-402 (1 May 1983).
The $\tilde{A}^2\Pi_{\Omega,u} \leftrightarrows X\sim{}^2\Pi_{\Omega,g}$, $\Omega=3/2$, 1/2, electronic transitions of rotationally and vibrationally cooled dichlorodiacetylene and dibromodiacetylene cations in the gas phase have been studied by emission and laser excitation spectroscopies. The emission spectra were obtained by electron impact excitation of the molecules seeded in a supersonic helium free jet and the excitation spectra by laser-excited fluorescence of cations cooled to liquid nitrogen temperature. The narrowing of the vibronic bands in the spectra allow the vibrational frequencies for these cations in the $\tilde{X}^2\Pi_{\Omega,g}$ and $\tilde{A}^2\Pi_{\Omega,u}$ states to be inferred to within 1-2 cm^{-1}. Complementary use of both sets of data enable the spin-orbit components to be unambiguously identified and many spectral features to be interpreted. The vibrational frequency trends are also discussed. (11 refs.)

70938 The spectroscopy and single vibronic level fluorescence quantum yields of jet cooled trans-stilbene and its Van der Waals complexes. T.S.Zwier, E.Carrasquillo M., D.H.Levy (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5493-505 (1 May 1983).
This paper reports results on the spectroscopy and dynamics of trans-stilbene seeded in a supersonic free jet. The cooling provided by the expansion results in well-resolved vibronic structure near the origin. Fluorescence excitation spectra reveal two low frequency vibrational modes at 82 and 95 cm^{-1} above the origin. By 1800 cm^{-1} above the origin the discrete vibronic structure has given way to a continuous absorption which extends to 6200 cm^{-1} blue of the origin. The fluorescence excitation spectrum is combined with a direct absorption measurement in the jet using a Xe lamp in order to obtain SVL fluorescence quantum yields for the isolated trans-stilbene molecule. The fluorescence quantum yields show no mode dependence, indicating that vibrational relaxation within the trans configuration is much faster than isomerization to the perpendicular configuration. Stilbene van der Waals complexes with helium and argon have been identified in fluorescence excitation spectra at higher nozzle backing pressures. Dispersed fluorescence spectra of these complexes place an upper bound on the stilbene-He binding energy in the excited state of 82 cm^{-1}. Several features of the photodissociation of these complexes are discussed. (20 refs.)

70939 Excited-state dynamics of 3-hydroxyflavone. A.J.G.Strandord, S.H.Courtney, D.M.Friedrich, P.F.Barbara (Dept. of Chem., Univ. of Minnesota, Minneapolis, MN, USA).
J. Phys. Chem. (USA), vol.87, no.7, p.1125-33 (31 March 1983).
The authors have investigated the time- and wavelength-resolved fluorescence spectroscopy of 3-hydroxyflavone (3HF) in several solvents and find that the photodynamics are well described by a kinetic model that includes two pathways for excited-state intramolecular proton transfer (ESIPT). They are unable, at present, to identify a single dominant effect that controls the ESIPT kinetics in all solvents. Their data reveal an irreversible excited-state isomerization that occurs at a rate which is temperature and solvent dependent. This rate is exceptionally small (10^8-$10^{11}s^{-1}$) as compared to the published unresolvably rapid kinetics ($>10^{11}$ s^{-1}) observed for the other ESIPT molecules studied to date. In the paper they describe in detail the fluorescence kinetics of 3HF and propose some preliminary mechanistic interpretations of these data. (27 refs.)

70940 Excited-state intramolecular proton transfer and vibrational relaxation in 2-(2-hydroxyphenyl)benzothiazole. K.Ding, S.J.Courtney, A.J.Strandjord, S.Flom, D.Friedrich, P.F.Barbara (Dept. of Chem., Univ. of Minnesota, Minneapolis, MN, USA).
J. Phys. Chem. (USA), vol.87, no.7, p.1184-8 (31 March 1983).
The time and wavelength-resolved electronic fluorescence of 2-(2-hydroxyphenyl)benzothiazole in argon at 12K has been investigated under high-resolution conditions. The 475-nm emission band is produced <10 ps after optical excitation and exhibits rapid band-shape evolution. No emission is observed at <450 nm. The implication of these results on the understanding of the mechanism for excited-state intramolecular proton transfer of this molecule is discussed. (16 refs.)

70941 Time-resolved fluorescence spectra of rotationally cooled NO_2. W.R.Ferrell, C.H.Chen, M.G.Payne (Chem. Phys. Section, Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
J. Phys. B (GB), vol.16, no.10, p.1721-32 (28 May 1983).
A tunable, pulsed dye laser was used to selectively excite rotationally cooled NO_2. Excitation fluorescence spectra, as well as wavelength-resolved fluorescence spectra, are presented. The radiative decay modes for various transitions are determined by examining the temporal dependence of the wavelength-resolved fluorescence lines. Single exponential decays were observed. (18 refs.)

70942 Experimental lifetimes, Lande factors and relaxation rates in $^{130}Te_2$. M.Ya.Tamanis.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.1, p.13-21 (1983). In Russian.
Spontaneous lifetimes for the (ν',J′) levels of the $A0_u{}^+$ and $B0_u{}^+$ states of $^{130}Te_2$ have been measured by means of laser-excited time-resolved fluorescence. The Hanle effect of $A0_u{}^+$, $B0_u{}^+$ and $X0_g{}^+$ states was studied. Using measured lifetimes the Lande factors from Hanle contours have been obtained. Relaxation cross sections in collisions with Te_2, Xe and He are presented. (13 refs.)

70943 Simultaneous transitions in light-scattering spectra induced by collisions between molecules. M.O.Bulanin, A.P.Kouzov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.266-9 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.450-6 (Sept. 1982). [received: May 1983]
Within the framework of the dipole-induced-dipole model with the assistance of an irreducible-spherical tensor formalism, the polarizability induced under binary interactions of anisotropic molecules was calculated. It was shown that the contribution to induced polarizability, which is proportional to the product of anisotropies $\gamma_a\gamma_b$, determines the possibility of simultaneous rotational excitation for a pair of molecules *ab* under light scattering. Measurements of contours for simultaneous-transition bands are promising from the standpoint of the study of the internal dynamics of condensed systems. An estimation for liquid hydrogen demonstrates that the intensity of the effect is sufficiently high to be detected experimentally. (24 refs.)

70944 Fluorescence yields from photodissociation of NH_3 and H_2O_2. M.Suto, L.C.Lee (Dept. of Electrical & Computer Engng., San Diego State Univ., San Diego, CA, USA).
Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.50-1
The photoabsorption cross sections and photoemission cross sections of NH_3 were measured in the 1060-2000 Å region. The fluorescence from photofragment of NH_3 was measured by a PMT sensitive in the 1900-8000 Å region. The fluorescence cross sections were determined by calibrating the fluorescence intensities against the $OH(A^2\Sigma^+ \rightarrow X^2\Pi_i)$ emission from photodissociation of H_2O, for which the cross section is known. The absorption cross sections and photoemission cross sections of H_2O_2 were measured in the 1060-1900 Å region. (no refs.)

33.65 PHOTOELECTRON SPECTRA

70945 The first band in the He(I) photoelectron spectrum of the CH_2Cl free radical. L.Andrews, J.M.Dyke, N.Jonathan, N.Keddar, A.Morris, A.Ridha (Dept. of Chem., Univ. Southampton, Southampton, England).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.89-93 (6 May 1983).
The fluorine atom reaction with CH_3Cl provides the CH_2Cl free radical for observation of a structured photoelectron band at 8.88±0.01 eV vertical ionization energy with 1020±40 cm^{-1} vibrational intervals. This spacing is appropriate for the C-Cl fundamental in CH_2Cl^+ based on increase (p-p)π bonding in the cation as compared to the free radical. (33 refs.)

70946 Photoelectron spectra of 1,2,3-triazine and its methyl derivatives. R.Gleiter, J.Spanget-Larsen, R.Bartetzko (Inst. fur Organische Chem., Univ. Heidelberg, Heidelberg, Germany), H.Neunhoeffer, M.Clausen.
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.94-7 (6 May 1983).
The He(Iα) photoelectron (PE) spectra of 1,2,3-triazabenzene and its five mono-, di-, and tri-methyl derivatives are reported. The PE bands are assigned by comparison with the results of molecular orbital (MO) calculations and empirical correlation procedures. (10 refs.)

70947 Laser photoelectron spectroscopy of MnH^- and FeH^-: electronic structures of the metal hydrides, identification of a low-spin excited state of MnH, and evidence for a low-spin ground state of FeH. A.E.Stevens, G.S.Feigerle, W.C.Lineberger (Dept. of Chem., Univ. of Colorado, Boulder, CO, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5420-31 (1 May 1983).
The laser photoelectron spectra of MnH^- and MnD^-, and FeH^- and FeD^- are reported. A qualitative description of the electronic structure of the low-spin and high-spin states of the metal hydrides is developed, and used to interpret the spectra. A diagonal transition in the photodetachment to the known high-spin, $^7\Sigma^+$, ground state of MnH is observed. An intense off-diagonal transition to a state of MnH, at 1725±50 cm^{-1} excitation energy, is attributed to loss of an antibonding electron from MnH^-, to yield a low-spin quintet state of MnH. For FeH^- the photodetachment to the ground state is an off-diagonal transition, attributed to loss of the antibonding electron from FeH^-, to yield a low-spin quartet ground state of FeH. A diagonal transition results in an FeH state at 1945±55 cm^{-1}; this state of FeH is assigned as the lowest-lying high-spin sextet state of FeH. An additional excited state of MnH and two other excited states of FeH are observed. Excitation energies for all the states are reported; vibrational frequencies and bond lengths for the ions and several states of the neutrals are also determined from the spectra. The electron affinity of MnH is found to be 0.869±0.010 eV; and the electron affinity of FeH is determined to be 0.934±0.011 eV. Spectroscopic constants for the various deuterides are also reported. (47 refs.)

70948 Extra-atomic relaxation in HCl, ClF, and Cl_2 from X-ray photoelectron spectroscopy. K.D.Bomben, J.K.Gimzewski, T.D.Thomas (Dept. of Chem., Oregon State Univ., Corvallis, OR, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5437-42 (1 May 1983).
Application of the Manne-Aberg sum rule to the full photoelectron spectrum of core-ionized HCl, ClF, and Cl_2 gives relative extra-atomic relaxation energy for these molecules. The values obtained are in excellent agreement with those determined from the Auger parameter. These measurements together with the core ionization energies confirm that ClF is $Cl^{\delta+}F^{\delta-}$ rather than $Cl^{\delta-}F^{\delta+}$, as had been suggested by measurements of the molecular Zeeman effect. (41 refs.)

70949 Photoelectron spectra of the lanthanide trihalides and their interpretation. B.Ruscic, G.L.Goodman, J.Berkowitz (Argonne Nat. Lab., Argonne, IL, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5443-67 (1 May 1983).
The He I photoelectron spectra of gaseous $LaCl_3$, $LaBr_3$, LaI_3, $CeBr_3$, CeI_3, $NdBr_3$, NdI_3, ErI_3, $LuBr_3$, and LuI_3 have been obtained. They display a pronounced increase in splitting, and hence a progressively clearer definition of peaks in the valence band as either the halogen or the lanthanide increases in atomic number. These experimental features, together with a refined relativistic $X\alpha$ DVM calculation using the von Barth-Hedin potential, have enabled the authors to assign these peaks with confidence. The He II photoelectron spectra of $CeBr_3$, $NdBr_3$, and LuI_3 are also presented. They reveal that the 4*f*-like ionizations of early lanthanide members (e.g. Ce) occur at lower energy than the ligand valence band, but that those of late members (e.g. Lu) are corelike. The aforementioned calculations reproduce this behavior quantitatively. They also help to rationalize a bimodal behavior in the valence band; the spectra with less than half-filled 4*f* shell are very similar, as are those with more than half-filled 4*f* shell, but the two groups are distinctly different. The width of the valence bands, which varies over a factor 2.5, is correctly reproduced. The calculations have been extended to include fluorides, where contact is made with electron impact mass spectrometry and X-ray photoelectron spectra of solids, thereby enabling corrections to be made to the latter. The fragmentation behavior in mass spectrometry is then related to the states observed in photoelectron spectroscopy. Both the calculations and these experimental comparisons yield a picture in which the lanthanide fluorides display predominantly ionic bonding (Ln^{22+}); the bonding takes on successively more covalent character as one proceeds to chlorides ($Ln^{1.6+}$), bromides ($Ln^{1.3+}$), and iodides ($Ln^{1.0+}$). (34 refs.)

70950 A photoelectron spectroscopic study of (3+1) resonant multiphoton ionization of NO and NH_3. Y.Achiba, K.Sato, K.Shobatake, K.Kimura (Inst. for Molecular Sci., Okazaki, Japan).
J. Chem. Phys. (USA), vol.78, no.9, p.5474-9 (1 May 1983).
In the present work, the authors have measured energy spectra and angular distributions of photoelectrons emitted by three-photon resonant four-photon ionization of NO and NH_3 in the gas phase. The following conclusions have been obtained: (1) Ionization of NO through the Rydberg *F* and *H*(*H*′) states at $\nu'=0$ and 1 gives rise to the ground-state ion with $\nu=0$ and 1, respectively, by a $\Delta\nu=0$ transition; (2) Ionization of NH_3 through the Rydberg *C*′ states with $\nu'=0$-5 gives rise to the ground-state ion with $\nu=0$-5, respectively, by $\Delta\nu=0$ transitions; (3) Photoelectron angular distributions obtained for the (3+1) processes may well be interpreted in terms of cosine-square distributions. This fact strongly indicates that the ionization step takes place by one-photon direct ionization from the three-photon resonant states. (31 refs.)

70951 The HeI excited electron spectrum of phosphine—an experimental and theoretical study. R.Maripuu, I.Reineck, H.Agren, Wu Nian-Zu, Ji Ming Rong, H.Veenhuizen, S.H.Al-Shamma, L.Karlsson, K.Siegbahn (Inst. of Phys., Uppsala Univ., Uppsala, Sweden).
Mol. Phys. (GB), vol.48, no.6, p.1255-67 (20 April 1983).
The HeI excited electron spectrum of phosphine (PH_3) has been recorded with high resolution. The $^2A_1$ band reveals an extensive vibrational progression in the ν_2 bending mode with irregular structure at the low binding energy side due to hindered inversion. The existence of a barrier in the $PH_3{}^{+2}A_1$ ionic state has been confirmed by vibrational energy level and Franck-Condon factor calculations based on CASSCF calculations of the total energy. The

equilibrium angle between a P-H bond and the plane of the three hydrogen atoms in this ionic state was determined to be 15.5° and the barrier against inversion to be 160 meV. The adiabatic electron binding energy of this transition ($\tilde{X}^2A_1 \leftarrow X^1A_1$) was found to be 9.868±0.005 eV. (26 refs.)

70952 Angle-resolved photoelectron spectroscopy of organic π orbitals. P.R.Keller, M.N.Piancastelli, J.W.Taylor (Univ. of Wisconsin, Madison, WI, USA), T.A.Carlson, F.A.Grimm.

Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.29-30

A systematic gas phase study of π orbitals in a wide variety of organic molecules was accomplished using angle-resolved photoelectron spectroscopy. Angular distribution measurements were carried out as a function of photon energy in the 10 to 30 eV range. The angular distribution parameter, β, exhibited a dependence upon energy which was very similar for all the π orbitals investigated. Typically, the β value was found to be low near threshold, but it increased rapidly in the first 10 to 15 eV above threshold and then began to level off at electron energies higher than 10 or 15 eV. (7 refs.)

70953 Observation of a new Rydberg series of CO in the 450 Å region. C.Y.R.Wu, D.L.Judge (Dept. of Phys. & Space Sci. Center, Univ. of Southern California, Los Angeles, CA, USA).

Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.58

Using synchrotron radiation as a continuous background, the absorption spectrum of CO in the 380-470 Å region was obtained using a double ionization chamber. A Rydberg series in the 450 Å (27.5 eV) region has been observed to converge to the $F^2\Pi$ state, a two-electron excited state of CO. The series limit determined at 28.11 eV is in excellent agreement with the vertical ionization potential of the $F^2\Pi$ state measured by high resolution photoelectron spectroscopy. (no refs.)

33.70 INTENSITIES AND SHAPES OF MOLECULAR SPECTRAL LINES AND BANDS

70954 Comments on the vibrational structure in dye's superexcitation spectra. P.P.Kircheva.

Bulg. J. Phys. (Bulgaria), vol.10, no.1, p.74-8 (1983).

During the last two years new experiments carried out with the purpose of elucidating the nature of the absorption edge structure in dye superexcitation spectra have been reported in the literature. These experiments suggest a treatment of the absorption as apparent since it appears between two emission lines with long wavelength tails. Spectra in which the absorption cannot be assumed to be apparent are reported here. Two of the assumptions existing thus far in the literature have been discerned as most probable for the explanation of this 'non-apparent' structure. Experimental data have been used to show that the spectral change, observed in the new experiments, about the lines is obtained if the line intensity is not sufficiently high. The pumping at intensities considerably exceeding the threshold ones so as to obtain the scattering components is a condition for the occurrence of the spectral change. (12 refs.)

70955 The radiative lifetime of the $A^1\Pi$ state of CH^+ calculated from long CAS SCF expansions. M.Larsson (Res. Inst. of Phys., Stockholm, Sweden), P.E.M.Siegbahn.

Chem. Phys. (Netherlands), vol.76, no.2, p.175-84 (15 April 1983).

A theoretical study of the $A^1\Pi$-$X^1\Sigma^+$ transition of CH^+ is presented. Radiative lifetimes (τ) for the A state and the $f_{v'v''}$(A-X) oscillator strengths are calculated, using long mutually non-orthogonal CAS SCF expansions. The convergence of these properties is studied with respect to the size of the active orbital space and the basis set. Very large active spaces and basis sets are needed for obtaining reliably convergent results. The best calculated value for $\tau(v'=0)$ of 850 ns and for f_{00} of 5.45×10^{-3} are in good agreement with the results from the most recent experimental investigation, 815±25 ns and $(5.66 \pm 0.20) \times 10^{-3}$ respectively. In the calculation use has been made of experimental excitation energies and potential curves. Compared to the previously most accepted lifetime the present theoretical and the recent experimental values demand an increase of the interstellar CH^+ abundance. (32 refs.)

70956 Relative intensities of *P*, *Q*, and *R* branches of ν_4 of SF_6. S.Chin, W.B.Person (Dept. of Chem., Univ. of Florida, Gainesville, FL, USA).

J. Mol. Spectrosc. (USA), vol.98, no.1, p.258-61 (March 1983).

The authors measure the IR intensities of the branches in the FSF bending mode in ν_4 of SF_6, since the Coriolis effect is expected to be largest for that mode. The experiment consists of carefully recording the absorbance vs. wavenumber for a sample of SF_6 at known pressure and pathlength, and then measuring the integrated intensity in each branch of the absorption band. In initial attempts to do this, the authors measured the spectrum at low pressures and at high resolution (0.06 cm^{-1}) to obtain a spectrum showing resolved rotational lines (actually clusters of lines). This intensity measurement was not very reproducible and was difficult to make accurately, so they adopted the technique of pressure-broadening to smooth out the structure from individual lines to give a smooth band contour. (11 refs.)

70957 Nitrogen-, oxygen-, and air-broadened widths and relative intensities of N_2O lines near 2450 cm^{-1}. R.L.Hawkins, J.H.Shaw (Dept. of Phys., Ohio State Univ., Columbus, OH, USA).

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.6, p.543-8 (June 1983).

Spectra of the $\nu_1+2\nu_2$ and the weak underlying $\nu_1+3\nu_2-\nu_2$ band of N_2O near 2450 cm^{-1} have been analyzed by the nonlinear, least-squares, whole-band technique. The oxygen-, nitrogen-, and air-broadened line widths and the relative line intensities were determined. The air-broadened widths, for $|m|>3$, are in agreement with those in the 1980 AFGL line listing and the relative band intensities also agree, within about 20%, with the values in this listing. (21 refs.)

70958 Influence of solvents on the relaxation times of polymethine dyes in the picosecond range. B.F.Bareika, R.V.Danelyus, G.A.Dikchyus, G.G.Dyadyusha, A.A.Ishchenko, M.A.Kudinova, A.P.C.Piskarskas, V.A.Sirutkaitis, A.I.Tolmachev (V. Kapsukas State Univ., Vilnius, Lithuanian SSR).

Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1485-9 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2289-95 (Nov. 1982). [received: May 1983]

An investigation was made of the dependence of the relaxation time τ of the excited states of fourteen polymethine dyes with an absorption maximum near 1.06 μ on the nature of the solvent. The measurements were made by the direct method of picosecond flash photosecond flash photolysis. It was established that a choice of a suitable solvent could alter the value of the relaxation time τ by a factor of 1.5-5. A study of the dyes in various solvents made it possible to select materials for passive switches with relaxation times in the range from 2 to 130 psec. (17 refs.)

33.80 PHOTON INTERACTIONS WITH MOLECULES

70959 The temperature dependence of the Cotton-Mouton effect of ethane, ethene and ethyne. H.Kling, H.Geschka, W.Huttner (Abteiling Chem. Phys., Univ. Ulm, Ulm, Germany).

Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.631-5 (29 April 1983).

The magnetic-field-induced birefringence of the three gases ethane, ethene, and ethyne has been measured between −80 and +120°C, at pressures up to 1 bar. The molar Cotton-Mouton constants depend linearly on the reciprocal absolute temperature which is in agreement with the well-known theory for non-interacting molecules. Magnetic hyperpolarizability anisotropy parameters, susceptibility anisotropies, and some secondary quantities of these molecules have been determined for the first time. (19 refs.)

70960 On the interaction operator in the optical spectroscopies with spin. D.Lee, A.C.Albrecht (Dept. of Chem., Cornell Univ., Ithaca, NY, USA).

J. Chem. Phys. (USA), vol.78, no.9, p.5374-8 (1 May 1983).

Recently the formalism describing the interaction of light with matter has been examined by Yang (1982) from the point of view of gauge invariance. Here this subject is discussed at the electric-dipole approximation for spin 'forbidden' optical transitions between molecular eigenstates. It is shown how the 'position' form of the interaction operator is the correct form, just as in the case of the spin-free spectroscopies. Furthermore, direct (allowed) optical transition between states with different spin angular momenta is possible (even at the electric-dipole approximation to the field), through the interaction of the spin magnetic moments with the magnetic field that is generated by the orbital motion of the electrons within the sinusoidally varying electric field of the incident light. However, the magnitude of its contribution to a spin forbidden transition is at the level of the direct magnetic-dipole transition between pure spin states; it can be expected to be relatively weak for systems containing atoms from the second period and beyond where the usual spin-orbit coupling mechanisms dominate in making spin forbidden transitions allowed. Cross terms between transition amplitudes from different mechanisms are found to vanish after appropriate orientational averaging. Spin forbidden transitions in benzene are reexamined in detail. (28 refs.)

33.80E Autoionization, photoionization, and photodetachment

70961 Molecular beam photoionization study of H_2S. H.F.Prest, W.-B.Tzeng, J.M.Brom,Jr., C.Y.Ng (US DOE, Iowa State Univ., Ames, IA, USA).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.50, no.3, p.315-29 (15 May 1983).
Photoionization efficiency data for H_2S^+, S^+ and HS^+ have been obtained in the region 645-1190 Å using the molecular beam method. The ionization energy of H_2S was determined to be 10.4607 ± 0.0026 eV (1185.25 ± 0.30 Å). The observed autoionizing vibrational progressions are tentatively assigned to the Rydberg transitions: $5a_1 \rightarrow nsa_1$ ($n=5$ and 6) and $2b_2 \rightarrow nda_1$ ($n=4$ and 5). (39 refs.)

70962 Dissociation of benzylamine ions following infrared multiple photon absorption, electron impact ionization, and UV multiphoton ionization. J.H.Catanzarite, Y.Haas, H.Reisler, C.Wittig (Dept. of Electrical Engng. Phys. & Chem., Univ. of Southern California, Los Angeles, CA, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5506-12 (1 May 1983).
The dissociation of benzylamine ions following (i) electron impact (EI) ionization, (ii) multiphoton ionization (MPI) at 266 nm, and (iii) infrared multiple photon absorption (IRMPA) at 9.26 μm is reported. In the EI and MPI experiments, three competitive dissociation pathways are observed. In the IRMPA experiments, benzylamine ions prepared by MPI at low fluences are fragmented very efficiently following irradiation with the focused output from a pulsed CO_2 laser. However, in contrast to the EI and MPI results, the IRMPD experiments reveal only a single, lowest energy, dissociation pathway and the fragmentation pattern is consistent with a sequential mechanism in which daughter ions continue to absorb the IR radiation and dissociate. The differences are explained by the different natures of the excitation processes: in IRMPA, the relatively slow up-pumping rate and the long rise time of the CO_2 laser pulse restrict the levels of excitation in the dissociating parent ions and favor sequential processes along the lowest energy decomposition pathways. (34 refs.)

70963 Laser photodissociation of Na_2^+ ions produced by laser resonant and non-resonant ionisation of Na vapour. F.Roussel, B.Carre, P.Breger, G.Spiess (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France).
J. Phys. B (GB), vol.16, no.10, p.1749-65 (28 May 1983).
The authors report direct measurements of the photodissociation of Na_2^+ ions created when a Na vapour in the density range 10^{12}-10^{13} cm^{-3} is irradiated by a pulsed laser with intensities in the 10^5-10^6 W cm^{-2} range. The Na_2^+ ions, accelerated by a weak electric field, are photodissociated in a second laser beam tuned to 6040 Å. In a preliminary experiment the Na_2^+ ions are formed in the lowest vibrational levels and the measured photodissociation cross section is compared with existing calculations. When the Na vapour is irradiated at one of the $3S_{1/2}$-$3P_{1/2,3/2}$ resonances the photodissociation measurements show the existence of a distribution of rovibrational excited levels of the Na_2^+ ions. A discussion is given in terms of associative ionisation in collisions of two Na(3p) atoms. The origin of the Na^+ ions produced simultaneously with the Na_2^+ ions, in the vapour irradiated at resonance, is also discussed. (25 refs.)

70964 Pyrene quenching in a fluorescence, photoacoustic, and two-photon photoionization cell. E.Voigtman, J.D.Winefordner (Chem. Dept., Univ. of Florida, Gainesville, FL, USA).
Spectrosc. Lett. (USA), vol.16, no.4, p.287-97 (1983).
A nitrogen laser-excited windowless flow cell has been used to examine the effects of various quenching agents (CH_3NO_2, CCl_4, and CH_3CH_2I) on the fluorescence (FL), photoacoustic effect (PA), and two-photon photoionization (2PI) of pyrene in ethanol. The results show that both the lowest excited singlet state (S_1) and the lowest triplet (T_0) are involved as real intermediate states in the consecutive two-photon photoionization of pyrene. (20 refs.)

33.80G Diffuse spectra; predissociation, photodissociation

70965 Photodissociation and predissociation in strong electromagnetic field: distortion of the continuum. A.Lami, N.K.Rahman (Istituto di Chimica Quantistica ed Energetica Molecolare, CNR, Pisa, Italy).
THEOCHEM (Netherlands), vol.10, p.295-8 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
Continuum can be distorted by a strong external electromagnetic field. It is shown how such distortion can be induced by utilizing molecules in a generalized double resonance experiment. Some of the recent results are stressed and the role of theoretical chemistry in studying such phenomena is pointed out. (9 refs.)

70966 Weak Van der Waals complexes of the X...BC type: calculation of linewidths of metastable levels. M.Aguado, J.Salgado, C.Serrano (Facultad de Ciencias, Univ. Autonoma de Madrid, Madrid, Spain), P.Mareca, P.Villarreal, G.Delgado-Barrio.
THEOCHEM (Netherlands), vol.10, p.325-8 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The authors have applied a three-dimensional quantum model, very close to that of Beswick et al. (1980), to study the dynamics of vibrational predissociation (VP) of the He...I_2^* Van der Waals molecule near the dissociation limit of the I_2 subunit. The half-linewidth for vibrational predissociation Γ as a function of the vibrational excitation of I_2 exhibits a maximum about $v_{I2}=57$ in agreement with the experimental behaviour found by Sharfin et al. (1981). (8 refs.)

70967 Dissociation dynamics in high-energy molecule-surface collisions: the dissociation rainbow effect. R.Elber, R.B.Gerber (Dept. of Phys. Chem., Hebrew Univ. of Jerusalem, Jerusalem, Israel).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.4-8 (6 May 1983).
Molecular dissociation in collisions with chemically inert surfaces is studied by classical trajectories. Calculated scattering intensities show striking features. For softly repulsive molecule-surface interactions, fragment angular distribution has a strong nonspecular peak (new rainbow effect), the velocity distribution exhibits two maxima. Multiple-collision mechanisms conveniently interpret the results. (17 refs.)

70968 Photodissociation kinematics. II. Laboratory angular distributions of a hydride model system and the kinematic isotope effect. Kuo-Mei Chen (Dept. of Chem., Nat. Sun Yat-sen Univ., Kaohsiung, Taiwan), Cheng-Chih Pei.
Chem. Phys. (Netherlands), vol.76, no.2, p.219-24 (15 April 1983).
For pt.I see Proc. Natl. Sci. Counc., vol.6, p.148 (1982). In the study of photodissociation processes, a theoretical framework of the laboratory angular distributions of photofragments has been firmly established. Numerical calculations of $F_{l l_1 l_2}^{\,1}(x)$, which is the radial-rotational coupling coefficient in a quantum-mechanical center-of-mass to laboratory-frame transformation, are implemented. The general behavior of $F_{l l_1 l_2}^{\,1}(x)$ as a parametric function of l, l_1, l_2 and x is explored. To illustrate the calculation of the laboratory angular distributions in a photodissociation process, a hydride model system is chosen. The parametric dependences of the photofragment's angular distribution on the initial linear momentum, recoil momentum and the angular momentum of the repulsive state are demonstrated in these numerical calculations. The laboratory angular distributions of photodissociated hydrogen and deuterium atoms exhibit a kinematic isotope effect. (3 refs.)

70969 Energy levels and photopredissociation of the He-I_2 van der Waals complex in the IOS approximation. E.Segev, M.Shapiro (Dept. of Chem. Phys., Weizmann Inst. of Sci., Rehovot, Israel).
J. Chem. Phys. (USA), vol.78, no.8, p.4969-84 (15 April 1983).
Theory for bound states and photodissociation of triatomic molecules based on the IOSA is developed. The theory is applied to the energy levels and photopredissociation of the He-I_2 van der Waals complex. The observed vibrational excitations are shown to be due to the librational mode and the two peaks observed experimentally ($X'=1$ and $W'=1$ excitations) are shown to arise from interaction between librations about skewed and near collinear configuration. A small librational barrier (~ 1 cm^{-1}) is postulated to exist. Interference effects between direct photofragmentation and the resonance enhanced (predissociation) process, as well as interferences between two angular ranges leading to rotational rainbow type phenomena, are predicted to exist. (60 refs.)

70970 Photodissociation of triatomic molecules: rotational scattering effects. R.W.Heather, J.C.Light (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5513-30 (1 May 1983).
An exact quantum method for calculating the state-to-state direct photodissociation probabilities for arbitrary (linear or bent) triatomic molecules is presented. It is shown that this method, which requires the accumulation of Franck-Condon overlap integrals between the initial state and a scattering state satisfying arbitrary scattering boundary conditions, is equivalent to the solution of the driven equations of Band, Freed, and Kouri (1981). For both HCN and ICN the effects of variation of the final state potential on the vibrational and rotational distributions of the CN fragments are examined. Agreement of the authors' exact calculations with the approximate calculations of Morse and Freed (1980) is very good. (41 refs.)

70971 The dynamics of ethylene dimer infrared photodissociation in pulsed molecular beams. M.A.Hoffbauer, K.Liu, C.F.Giese, W.F.Gentry (Chem. Dynamics Lab., Univ. of Minnesota, Minneapolis, MN, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5567-81 (1 May 1983).
Molecular beam experiments have been carried out on the infrared photodissociation of the $(C_2H_4)_2$, $(C_2D_4)_2$, and $(C_2H_4).(C_2D_4)$ van der Waals molecules. Measurements of the frequency and fluence dependences of the photodissociation cross sections were performed over the CO_2 laser frequency range from 900 to 1100 cm^{-1}, which covers the region of the ν_7 out-of-plane vibration of C_2H_4 and the ν_{12} in-plane vibration of C_2D_4. In addition, the monomer product speed and angle distributions were measured in order to obtain information on the final energy disposition in the products. Absorption in either vibrational mode induces dissociation of the cluster, but the linewidth associated with excitation of the ν_7 mode of C_2H_4 is about four times larger than that associated with excitation of the ν_{12} mode of C_2D_4. Two-laser 'hole-burning' experiments demonstrate the homogeneity of the ground-state populations. The absorption intensities are not simply proportional to the number of molecules in the cluster capable of absorbing at a given frequency but instead appear to contain information on the structure of the dimer. The dissociation products are scattered isotropically in the center of mass system, with average recoil velocities which correspond to only a small fraction of the available energy appearing in translation. In the case of $(C_2H_4)_2$, the lack of vibrational modes at the corresponding product internal energies implies that the remaining energy goes into product rotation. Based on the rather detailed spectroscopic and dynamical information provided by these experiments, and the assumption of a skewed parallel structure for the dimer, qualitative arguments are presented that the observed linewidths are determined by the rates of the mode-specific anharmonic coupling of the monomer vibrations to the van der Waals coordinates, but not necessarily by the vibrational predissociation rates. (31 refs.)

70972 Bound-free spectroscopy of Cs_2^+. H.Helm, R.Moller (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).
Phys. Rev. A (USA), vol.27, no.5, p.2493-502 (May 1983).
Bound-free transitions of Cs_2^+ are studied in a fast-ion-beam photofragment spectrometer. Molecular cesium ions are produced by field ionization on a liquid cesium droplet and extracted as an ion beam. Their photodissociation is observed by monitoring the appearance and energy distribution of the charged photofragments Cs^+. In the wavelength range between 4067 and 9500 Å, three photodissociation channels are identified of the type $Cs_2^+(X\,^2\Sigma_g^+) + h\nu \rightarrow Cs_2^{+*} \rightarrow Cs^+(^1S_0) + Cs(nl) + E_{kin}$. At the longest wavelengths studied, photodissociation produces ground-state atoms Cs 6*s*. In the range between 5309 and 4545 Å, excited-state atoms Cs 6*p* are produced. Beginning at 4579 Å, photodissociation leads to formation of both Cs 6*p* and Cs 65*d*. The Cs 5*d* channel dominates at wavelengths around 4100 Å. The angular distribution of photofragments is investigated to help identify the excited molecular states involved in the photodissociation processes. An approximate relative cross section for photodissociation of Cs_2^+ over this wavelength range is obtained. At 7992.2 Å the absolute cross section for photodissociation of Cs_2^+ is measured to be 2×10^{-16} cm^2. The measurements establish, for the first time, a lower limit for the bond energy of $Cs_2^+(X\,^2\Sigma_g^+)$ of 0.59 ± 0.06 eV. This places an upper limit of 3.76 ± 0.06 eV for the ionization potential of $Cs_2(X\,^1\Sigma_g^+)$. (30 refs.)

33.80K Multiphoton processes

70973 **The discovery of a 3p Rydberg state in benzene by three-photon resonant multiphoton ionization spectroscopy.** P.M.Johnson, G.M.Korenowski (Dept. of Chem., State Univ. of New York, Stony Brook, NY, USA).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.53-6 (6 May 1983).
A new $^1E_{2u}$ $3p_{x,y}$ Rydberg state is found in the three-photon spectrum of benzene at 56080 cm^{-1}, near the previously known $^1A_{2u}$ state. The vibronic structure of these states is found to be intertwined and an e_{2g}, vibration previously assigned to the $^1A_{2u}$ state is suggested to belong to $^1E_{2u}$. This vibration is of such a frequency in both states as to indicate a considerable amount of valence character due to mixing with the nearby $^1E_{1u}$ valence state. (5 refs.)

70974 **Infrared-microwave two-photon spectra of the ν_3 bands of $^{12}CH_3F$ and $^{13}CH_3F$.** P.Shoja-Chaghervand, R.H.Schwendeman (Dept. of Chem., Michigan State Univ., East Lansing, MI, USA).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.27-40 (March 1983).
Infrared-microwave two-photon spectra have been obtained for the ν_3 bands of $^{12}CH_3F$ and $^{13}CH_3F$ with a two-photon spectrometer employing a CO_2 laser and a computer-coupled microwave source operating in the 8-18 GHz region. Even though the intensities of the spectra for the double parity levels in these molecules are inversely proportional to the square of the microwave frequency, transitions have been observed with microwave frequencies of up to 16 GHz. Comparison of these observed two-photon frequencies to frequencies predicted from infrared laser Stark spectroscopy, and to frequencies calculated from vibration-rotation parameters obtained by fitting these and other frequencies, shows agreement to within a few MHz. Spectroscopic parameters for the ground and ν_3 excited states of the two species are reported. (29 refs.)

70975 **The $\tilde{A}^1B_2$-$\tilde{X}^1A_1$ two-photon fluorescence excitation spectrum of 1,3-difluorobenzene.** J.M.Hollas, H.Musa, T.Ridley (Chem. Dept., Univ. of Reading, Reading, England).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.125-37 (March 1983).
The A^1B_2-X^1A_1 system of 1,3-difluorobenzene has been observed using the technique of two-photon fluorescence excitation obtained with a pulsed dye laser. Calibration was achieved by a combination of the neon optogalvanic spectrum and etalon fringes. In circular, compared to linear, polarization the bands divide into two groups, those which are B_2-A_1 and which retain their intensity with circular polarization, and those which are A_1-A_1 and lose about 60% of their intensity under the same conditions. These two kinds of bands also show characteristic rotational contours. All of the A_1-A_1 bands whose assignments are established obtain their intensity through vibronic interaction in which the vibration v'_{25} (v'_{14} in the Wilson numbering) mixes the A with, presumably, the X state. There is an important Fermi resonance between the 9^1 and 10^1 11^1 levels. Parts of the one-photon absorption spectrum have been photographed to identify sequences associated with the 0_0^0 band for comparison with those observed in the two-photon spectrum, and to search for bands involving odd quanta of b_2 vibrations, including v'_{25} (v'_{14}); none was found. (11 refs.)

34.00 ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS

34.10 GENERAL THEORIES AND MODELS

(inc. statistical theories, transition state, stochastic and trajectory models, etc; see also 82.20)

70976 **A new multiple (mass ratio) scale analysis of atom-diatom collisions.** B.Chang, H.Rabitz (Dept. of Chem., Princeton Univ., Princeton, NJ, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5531-50 (1 May 1983).
Atom-diatom collisions are investigated within the framework of a general mass weighted mixed coordinate systems. It is found that physically distinct parts of the Hamiltonian are controlled by functions that depend on the mass weighted mixing coefficients of the new coordinates. In principle, the mixing coefficients can be derived variationally from a stationary functional for the T-matrix. The mixed coordinate system developed in this paper can also be used to investigate a quantum mechanical decoupling approximation by parametrizing the mixing coefficients of the new coordinates in terms of the approximation's decoupling parameter. The goal of this paper is to examine the case when the mixing coefficients are expressed in terms of the ES decoupling parameter for vibrational transitions. A brief discussion is also given to the application of this technique to the investigation of the ES method for rotational transitions and vibrational transitions. This approach offers a practical avenue for improving ES results for collision systems having very small mass ratios. It is found in an example that when the collision system strongly satisfies the mass scaling criterion, the method gives uniformly accurate results for all energies and all transitions. When the collision system weakly satisfies the criterion, the method improves only the energy sudden results for multiple quantum transitions at energies which are close to the threshold limit. (39 refs.)

70977 **Approximate, non-relativistic scattering phase shifts, bound state energies, and wave function normalization factors for a screened Coulomb potential of the Hulthen type.** W.Buhring (Phys. Inst., Univ. Heidelberg, Heidelberg, Germany).
Z. Phys. A (Germany), vol.310, no.4, p.255-62 (1983).
Non-relativistic scattering phase shifts, bound state energies, and wave function normalization factors for a screened Coulomb potential of the Hulthen type are presented in the form of relatively simple analytic expressions. These formulae have been obtained by a suitable renormalization procedure applied to the quantities derived from an approximate Schrodinger equation which contains the exact Hulthen potential together with an approximate angular momentum term. When the screening exponent vanishes, the formulae reduce to the exact Coulomb expressions. The interrelation between these formulae and Pratt's 'analytic perturbation theory for screened Coulomb potentials' (1972, 1976) is discussed. (10 refs.)

34.20 INTERATOMIC AND INTERMOLECULAR POTENTIALS AND FORCES

(for molecular solids, see 31.70K)

70978 **On separation theorems for Van der Waals interactions.** A.C.Tanner, A.J.Thakkar (Guelph-Waterloo Centre for Graduate Work in Chem., Univ. of Waterloo, Waterloo, Ontario, Canada), B.Linder.
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.37-40 (6 May 1983).
Two integral representations for energy denominators, the Casimir-Polder form and a convolution form, are used to obtain separation theorems for Van der Waals interactions. The separation theorems are shown to be different and complementary; the convolution form yields the total second-order energy while the Casimir-Polder form yields the dispersion energy. (5 refs.)

70979 **Calculated ro-vibrational fine-structure spectrum and weak-field Zeeman splittings of the O_2Ar van der Waals molecule.** J.Tennyson (Inst. voor Theoretische Chem., Katholieke Univ., Toernooiveld, Nijmegen, Netherlands), J.Mettes.
Chem. Phys. (Netherlands), vol.76, no.2, p.195-202 (15 April 1983).
Ro-vibrational calculations are performed on O_2Ar explicitly including coupling to the O_2 electronic spin. Two different empirical potentials are used and give similar fine-structure spectra. The anisotropy in the potential is found to strongly perturb the O_2 fine-structure spectrum suggesting that the O_2Ar fine-structure spectrum can give detailed information about the anisotropy of the van der Waals interaction potential. Transition strengths for the complex fine-structure transitions are calculated and found to vary by two orders of magnitude. The Zeeman splitting of the levels by interaction with a weak magnetic field is also calculated. (22 refs.)

70980 **Diatomics-in-molecules potential energy surfaces of $(HeH_2)^+$: an extended basis set calculation.** F.Schneider, L.Zulicke (Central Inst. of Phys. Chem., Acad. of Sci., Berlin, Germany), R.Polak, J.Vojtik.
Chem. Phys. (Netherlands), vol.76, no.2, p.259-69 (15 April 1983).
Within the framework of the non-hermitean DIM formulation of Tully and Truesdale (1976), and using 13 symmetry-adapted polyatomic basis functions, ground-state and excited-state potential energy surfaces for $(HeH_2)^+$ have been calculated. Whereas the global shape of the potential energy surfaces is obtained in reasonable agreement with existing ab initio data, at least if scaling is introduced, there are marked differences in the details, e.g. the angular dependences and the splitting of the first and second excited-state potential energy surfaces. The dependence of the results on mixing parameters and scaling as well as implications concerning the predictive power of the DIM method are discussed. (25 refs.)

70981 **Computation of spectroscopic constants of some diatomic hydrides using Morse-Kratzer potential model.** K.Ramani, A.M.Ghodgaonkar (Univ. of Bombay, Bombay, India).
Indian J. Chem. A, vol.21A, no.8, p.803-4 (Aug. 1982). [received: April 1983]
The spectroscopic constants, namely the rotational constant (α_e), the vibrational constant ($\omega_e X_e$) and the binding energy (D_i) of some diatomic hydrides have been computed using the Morse-Kratzer potential. The computed values are in fair agreement with experimental data and rule out any sensitive dependence on arbitrary exponents used in earlier models. (8 refs.)

70982 **Solvation and conformation of methanol in water.** W.L.Jorgensen, J.D.Madura (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA).
J. Am. Chem. Soc. (USA), vol.105, no.6, p.1407-13 (23 March 1983).
Monte Carlo statistical mechanics simulations have been carried out for a dilute solution of methanol in water at 25°C and 1 atm. The water-water interactions were described with the TIP4P potential, while the methanol-water interactions were represented by a modified TIPS potential that incorporates the methyl hydrogens explicitly. The latter feature allowed the internal rotation for the methyl group to be included in the simulation. Statistics for the conformational process were enhanced by umbrella sampling over chopped rotational barriers. The computed heat of solution (-17 ± 5 kcal/mol) is in better accord with experiment (-10.8 kcal/mol) than earlier theoretical results. Furthermore, the preferred conformation of methanol in water is demonstrated to be staggered in contrast to the computed findings of Bolis, Corongiu, and Clementi (1982). Detailed structural results have also been obtained and are discussed. (39 refs.)

70983 **Dunham coefficients for seven isotopic species of CO.** G.Guelachvili, D.de Villeneuve, R.Farrenq, W.Urban, J.Verges (Lab. d'Infrarouge, Univ. de Paris-Sud, Orsay, France).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.64-79 (March 1983).
An extensive work on vibration-rotation spectra in the fundamental $^1\Sigma^+$ electronic state of CO is reported. More than 30000 Doppler-limited measurements corresponding to about 8500 transitions of 255 bands of $^{12}C^{16}O$, $^{12}C^{18}O$, $^{13}C^{16}O$, and $^{13}C^{18}O$, most of them observed for the first time, have been obtained with a high information Fourier transform interferometer on the sequences $\Delta v=1$, 2, and 3. The highest v and J values are 41 and 93, respectively. Experimental vibrational levels are then well observed up to three fourths of the dissociation energy limit. These accurate infrared wavenumbers, with an additional selected set of all previous measurements, have been simultaneously fitted to the Dunham expression in a weighted nonlinear least-squares calculation covering seven different isotopic species. It significantly improves both the number of parameters (U and Δ) obtained by the best previous work (35 instead of 23) and their corresponding standard deviations. The rms of the fit is equal to 13×10^{-6} cm^{-1} (390 KHz). Calculated wavenumbers from the 35 reduced Dunham and mass-scaling coefficients can then be used as secondary standards, even for transitions involving high v and J values of the various isotopic species. These new parameters should be a convenient and useful tool for several purposes, such as assignment of infrared

laser lines and identification of microwave and infrared transitions in astronomical spectra. The Dunham coefficients *Y* are also reported for $^{12}C^{16}O$, $^{12}C^{17}O$, $^{12}C^{18}O$, $^{13}C^{16}O$, $^{13}C^{17}O$, $^{13}C^{18}O$, and $^{14}C^{16}O$. These experimentally determined accurate *Y* should be useful for further examination of the potential energy and dipole moment formulations. (32 refs.)

70984 Evaluation of the spectroscopic constants of the modified Rittner potential by the Simon-Parr-Finlan technique. A.M.Ghodgaonkar, K.Ramani (Western Regional Instrumentation Centre, Univ. of Bombay, Bombay, India), P.D.Prabhavalkar.
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.445-9 (May 1983).
A critical examination is shown of the modified Rittner potential by use of the Simon-Parr-Finlan (SPF) technique, including contributions from the polarisability of ions and the van der Waals term. The authors develop an equation for the SPF constants, which are related to spectroscopic constants and the polarisability of the constituent ions. Their analysis indicates excellent agreement for the dissociation energies of 20 alkali halides with available experimental data. The authors also cite theoretical values of the SPF coefficients Y_{20} and Y_{11} for the 20 alkali halides; these also compare favourably with experimental data. (16 refs.)

70985 A multi-reference approach to energy decomposition for molecular interactions. F.Bernardi, M.A.Robb (Istituto Chimico 'G. Ciamician', Bologna, Italy).
Mol. Phys. (GB), vol.48, no.6, p.1345-55 (20 April 1983).
A method is proposed for the analysis of the components of molecular interaction energy using a multireference expansion of the wavefunction. The method can be applied to structural and reactivity problems. The MC-SCF orbitals of the isolated fragments are used as the basis for the construction of the wavefunctions of the molecule as a linear combination of fragment configurations. The energy decomposition is based upon the definition of no-bond and charge transfer configurations and is defined relative to a suitable reference state. The energy of an antisymmetrized product of isolated fragment wavefunctions gives the electrostatic and exchange repulsion energy, while the subsequent inclusion of the charge transfer configurations gives the valence charge transfer associated with bond formation. Orbital mixing between core and valence, core and virtual, and valence and virtual are then computed using second order perturbation theory or MC-SCF. For illustrative purposes the method has been applied to the analysis of the rotational barrier in ethane, the dimerization of methylene and the reaction of methylene and silylene. (21 refs.)

34.40 ELASTIC SCATTERING OF ATOMS AND MOLECULES

70986 Scattering off an ellipsoid: a semiclassical theory. Byung Chan Eu, M.L.Sink (Dept. of Chem., McGill Univ., Montreal, Quebec, Canada).
J. Chem. Phys. (USA), vol.78, no.8, p.4896-904 (15 April 1983).
The WKB approximation is developed for scattering of an atom by an ellipsoidal particle and elastic scattering cross sections are calculated by using the WKB phase shifts in the prolate spheroidal coordinates and uniform WKB approximations for angular spheroidal wave functions. The calculation of cross sections requires the solution of an elliptic boundary condition and is quite simple compared to the calculation in the close coupling theory in the spherical coordinate representation. A version of close coupling theory is briefly discussed in the prolate spheroidal coordinates. (14 refs.)

34.50 INELASTIC SCATTERING OF ATOMS AND MOLECULES

70987 Production of O^- from CO_2 by dissociative electron attachment. O.J.Orient, S.K.Srivastava (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.681-4 (29 April 1983).
Dissociative electron attachment cross-section measurements for the production of O^- from CO_2 have been performed utilizing a crossed target-beam-electron-beam collision geometry and a quadrupole mass spectrometer. The relative flow technique is employed to determine the absolute values of cross sections. The attachment energies corresponding to the five cross-section maxima are: 4.4 ± 0.1, 8.2 ± 0.1, 13.0 ± 0.2, 16.9 ± 0.2 and 19.4 ± 0.2 eV. The cross sections at these maxima are: 1.43×10^{-19} cm^2, 4.48×10^{-19} cm^2, 8.1×10^{-21} cm^2, 8.1×10^{-21} cm^2 and 1.2×10^{-20} cm^2, respectively. (17 refs.)

70988 Rate coefficient for ion-dipole orbiting collisions. D.R.Bates (Harvard-Smithsonian Center for Astrophys., Harvard Univ., Cambridge, MA, USA).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.19-22 (6 May 1983).
An improved version of the average dipole orientation (ADO) method is used to calculate the rate coefficient for ion-dipole orbiting (capture) rate coefficients. The results agree well with those obtained by the variational and by the statistical method. (9 refs.)

70989 On the dynamics in compressed methane gas at 3 kbar by inelastic neutron scattering. T.Johnson, L.G.Olsson (Dept. of Reactor Phys., Royal Inst. of Technol., Stockholm, Sweden).
J. Phys. B (GB), vol.16, no.10, p.1853-61 (28 May 1983).
The scattering function for methane gas at 295K and 3.0 kbar has been measured for wavevector transfers (*Q*) from 0.8 to 2.0 Å^{-1}. The maximum energy transfers vary over the range of *Q* from 13 to 26 meV. The second energy moments of the scattering function were evaluated for 1.6 Å$^{-1}\leq Q\leq2.0$ Å^{-1} showing a somewhat lower value, on average, than predictions based on decoupled translational and rotational motions. Combining this observation with the discrepancies between the measured scattering function and the calculated one, again assuming decoupled motions, there is an indication of weak coupling effects in the system. The frequency spectrum, reflecting the dynamics of the methane molecule, is estimated for energy transfers up to 17 meV, showing clear discrepancies compared with simple physical models which do not include coupling effects, e.g. the Langevin or rigid-sphere motion. (15 refs.)

70990 A differential equation method for the numerical evaluation of the Airy, Pearcey and swallowtail canonical integrals and their derivatives. J.N.L.Connor, P.R.Curtis, D.Farrelly (Dept. of Chem., Univ. of Manchester, Manchester, England).
Mol. Phys. (GB), vol.48, no.6, p.1305-30 (20 April 1983).
A method for the numerical evaluation of the swallowtail canonical integral $S(x, y, z)$ and its partial derivatives $\partial S/\partial x$, $\partial S/\partial y$ and $\partial S/\partial z$ is described. These integrals are required for applications in semiclassical collision theory and other short wavelength phenomena. The method integrates a set of three linear ordinary differential equations satisfied by $S(x, y, z)$. The authors first explain the method for the simpler cases of the Airy and Pearcey integrals. For $S(x, y, z)$, the integration starts at (0, 0, 0) and then proceeds in the *x* direction to (*x*, 0, 0). This is followed by an integration in the *y* direction to (*x*, *y*, 0). Finally integration in the *z* direction takes us to (*x*, *y*, *z*). The initial conditions at (0, 0, 0) are obtained from the exact series representation of $S(x, y, z)$. The method has been implemented on a computer and a discussion of its advantages and disadvantages is given. Isometric plots of $|S(x, y, z)|$ are presented for fixed values of *x*, *y* and *z* in order to illustrate in a systematic way the main properties of the swallowtail integral. A knowledge of the number of real stationary phase points in different regions of (*x*, *y*, *z*) space together with the shape of the swallowtail caustic are a useful way of understanding and rationalizing the structure in the $|S(x, y, z)|$ plots. (38 refs.)

34.50E Rotational and vibrational energy transfer

70991 Application of the refined Born approximation to atom-rigid rotor collision. G.Staszewska, T.Orlikowski (Inst. of Phys., Nicholas Copernicus Univ., Torun, Poland).
Acta Phys. Pol. A (Poland), vol.A63, no.4, p.531-8 (April 1983).
Coupled equations obtained by Arthurs and Dalgarno (1960) for the collision of an atom with a rigid rotor have been solved with the help of the refined Born approximation in the case of a helium-atom-hydrogen-molecule scattering problem. An appropriate choice of the trial function allowed the authors to find the solution with high accuracy. For several values of energy and several values of total angular-momentum quantum numbers they give the elements of the reactance matrix and partial cross sections. For comparison they also solved the problem by Gordon's numerical procedure. (13 refs.)

70992 Rotational energy variations of the I_2 (B) molecule by low energy collisions with He. P.Mareca (Inst. de Estructura de la Materia, CSIC, Madrid, Spain), P.Villarreal, G.Delgado-Barrio.
THEOCHEM (Netherlands), vol.10, p.283-8 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The authors present a quasi classical study of the collision between He and iodine in the state B at very low energies (<0.5 cm^{-1}). The collisional process is reduced to a transference of the rotational to kinetic energy. The rotational excitation cross section that the authors report is in good agreement with that obtained by a quantum calculation. The efficiency of this process is enhanced by the formation of collisional complexes. (22 refs.)

70993 Effects of two-quantum processes on vibrational energy transfer in atom-diatom collinear collisions. H.K.Shin (Dept. of Chem., Univ. of Nevada, Reno, NV, USA).
Chem. Phys. Lett. (Netherlands), vol.97, no.1, p.41-8 (6 May 1983).
An approximate approach is developed to study the interference of one and two-quantum processes in collinear collisions of an atom and a harmonic oscillator. In deriving an explicit expression for vibrational transition probabilities, one-quantum processes are treated rigorously, while the contributions of two-quantum processes are solved in first order. The interference is found to be strong in the collision systems such as H_2+He, especially at high collision energies. In the collisions of a light atom with a heavy diatom, the interference is found to be not important even at such high energies. (17 refs.)

70994 Rate constants for vibrational energy transfer between CO ($\nu=1$) and CH_4 and substituted methane molecules in the temperature range 300 to 80K. D.C.Allen, C.J.S.M.Simpson (Phys. Chem. Lab., Univ. of Oxford, Oxford, England).
Chem. Phys. (Netherlands), vol.76, no.2, p.231-41 (15 April 1983).
Laser fluorescence has been used to measure rate constants for vibrational energy transfer from CO($\nu=1$) to the following molecules CH_4, CD_4, CD_3H, CF_4, CF_3H and CF_3D in the temperature range 300 to 80K. The differences in the rate constants between these related molecules are greatly accentuated at low temperatures; there being a factor of 70 at 300K and 1200 at 80K between the most and least efficient of these partners. (25 refs.)

70995 Excimer laser photolysis studies of translational-to-vibrational energy transfer in collisions of H and D atoms with CO. C.A.Wight, S.R.Leone (Joint Inst. for Lab. Astrophys., NBS, Boulder, CO, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.4875-86 (15 April 1983).
Translational-to-vibrational excitation of carbon monoxide is observed as a result of collisions of high energy H and D atoms with CO. The fast atoms are produced by excimer laser photolysis of H_2S, D_2S, HCl, HBr, or HI at 193 or 248 nm. Detection of time and wavelength-resolved infrared fluorescence is used to quantify the CO vibrational state excitation. The CO ($\nu=1-6$) state distribution from H (H_2S, 193 nm, $E_{cm}=2.3$ eV)+CO collisions is 0.74 ± 0.15, 0.15 ± 0.01, 0.08 ± 0.01, 0.01 ± 0.01, 0.02 ± 0.01, and 0.01 ± 0.01. The corresponding state distribution from D (D_2S, 193 nm, $E_{cm}=2.2$ eV)+CO is 0.79 ± 0.19, 0.13 ± 0.01, 0.05 ± 0.02, 0.02 ± 0.02, 0.01 ± 0.01, and 0.01 ± 0.01. Rotational excitation is at least as significant as vibrational excitation based on estimates of the total energy transfer. Measurements of the relative vibrational excitation efficiency as a function of initial H atom energy show that the fraction of translational energy converted to CO vibration increases by more than 300% as the initial H atom energy is increased from 1.0 to 3.2 eV. Good qualitative agreement is found between the experimental results and classical trajectory calculations carried out for collinear collisions of H and D atoms with CO using a simple repulsive interaction potential. (31 refs.)

70996 Rotational and vibrational-rotational relaxation in collisions of $CO_2(01^10)$ with He atoms. D.C.Clary (Dept. of Chem., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
J. Chem. Phys. (USA), vol.78, no.8, p.4915-23 (15 April 1983).
Rotational and vibrational-rotational relaxation of $CO_2(01^10)$ in collisions with He atoms is studied theoretically. Cross sections and rate coefficients have been calculated using a vibrational close-coupling, rotational infinite-order sudden method, together with an ab initio potential energy surface. Comparisons with previous calculations and experiments on rotational relaxation in $He+CO_2(00^01)$ are made. The rotational relaxation cross sections are found to be insensitive to the vibrational dependence of the He-CO_2 potential. Transitions between even and odd rotational states of the (01^10) level have relatively small cross sections. Interesting oscillating structures are predicted for the rotational dependence of the cross section distributions for transitions involving the (01^10) level. (36 refs.)

70997 Atom-molecule collisions at very low energies: a correlation function approach. C.Cerjan, M.Lipkin, S.A.Rice (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.4929-37 (15 April 1983).
An extension of the neutron diffraction formalism to low energy atom-molecule scattering including all recoil effects is presented. The nature of the atom-molecule interaction suggests that the diffraction model should be qualitatively correct in the low collision energy regime for vibrational relaxation. The customary impulsive collision assumptions which lead to the use of the Born approximation are replaced by more general transforms which account for possible distortion of the wave function by the potential. Model calculations for a simple vibrational deexcitation process are given. (11 refs.)

70998 A theoretical analysis of very low energy collision induced vibrational relaxation in the system He-$I_2(^3\Pi_{0u}{}^+)$. C.Cerjan, S.A.Rice (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.4952-7 (15 April 1983).
Vibrational deexcitation in the low energy collisions of He with I_2 $(^3\Pi_{0u}{}^+)$ is examined within the close-coupled scattering formulation using a sum of pairwise Morse interactions to describe the potential surface. Cross sections for zero total angular momentum are given as a function of energy for various rotational and vibrational transitions with the I_2 molecule prepared in the $n=25$ vibrational state. Similar results for total angular momentum of 2, 1, and 0 are also reported for the $n=1$ initial state of I_2. These calculations are in general agreement with the known experimental results and support the arguments advanced previously to explain the unexpectedly large observed relaxation cross section. (18 refs.)

70999 Rotational energy transfer in HF ($\nu=2$): double resonance measurements and fitting law analysis. R.A.Copeland, F.F.Crim (Dept. of Chem., Univ. of Wisconsin, Madison, WI, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5551-63 (1 May 1983).
Data from overtone vibration-laser double resonance experiments show extemely rapid rotational relaxation in HF ($\nu=2$) for rotational states up to $J=6$ and serve to test energy based fitting laws for rotational energy transfer rate constants. The observed rotational states equilibrate in less than a gas kinetic collision with some individual rates being more than twice the hard sphere collision rate. Energy based fitting laws reproduce the observed evolution of the state populations to within 30% but fail systematically for higher ($J=5$ and 6) rotational levels. Fitting laws formulated for collisions between an atom and a molecule are virtually as successful as those for collisions between two molecules. The extracted rate constants show that multiple rotational quantum energy transfer is an important aspect of relaxation dynamics. (31 refs.)

71000 Impact parameter dependence of *L*- and *K*-shell excitation in I-Ag collisions. E.Morenzoni, M.Nessi, P.Burgy, Ch.Stoller, W.Wolfli (Lab. fur Kernphys., Eidgenossische Tech. Hochschule, Zurich, Switzerland).
Z. Phys. A (Germany), vol.311, no.1-2, p.7-17 (1983).
The impact parameter dependence of the *L*- and *K*-vacancy production of target and projectile was measured in I-Ag collisions at 40 MeV and 63 MeV in an X-ray particle coincidence experiment. A large *L*-vacancy production is found for impact parameters b smaller than the *L*-shell radius with a pronounced increase for $b<250$ fm. The *L*-shell excitation is discussed in terms of $4f\sigma$ excitation and vacancy transfer in the $3p\sigma$, $3d\pi$, $3d\sigma$ molecular orbitals through $3p\pi$-$3p\sigma$ and $3d\delta$-$3d\pi$-$3d\sigma$ rotational-couplings. The $2p\sigma$ excitation probability is obtained from the summed *K*-vacancy production probability, and compared with the prediction of $2p\sigma$ excitation in a multiple collision process. The latter is determined by folding the measured I *L*-shell excitation probability with the impact parameter dependence of the $2p\pi$-$2p\sigma$ rotational coupling. The discrepancy observed at small impact parameters suggests an enhanced $2p\pi$ and $2p\sigma$ excitation at small impact parameters in a one-collision process. The *L*- and *K*-vacancy sharing probabilities are found to be impact parameter independent over a large impact parameter range. (39 refs.)

71001 Orientation of ^4He (2^3S_1) atoms in collisions with optically oriented Cs atoms. A.P.Bottcher (Inst. of Phys., N. Copernicus Univ., Torun, Poland).
Acta Phys. Pol. A (Poland), vol.A63, no.4, p.551-62 (April 1983).
Reports the investigations of the orientation of helium atoms in triplet 2^3S_1 metastable state through Penning collisions with optically oriented Cs atoms. The signals of the magnetic resonance in the metastable state were obtained for a wide range of helium pressures 130-12000 Pa. The influence of the discharge parameters on the orientation degree of helium atoms in their metastable state was studied. The experimentally obtained dependence of the magnitude of resonance signal on the helium pressure, on the pumping radiation intensity and on the density of Cs atoms are presented. (15 refs.)

71002 Excitation of vibrational and electronic states in a glow discharge column in flowing N_2. B.Massabieaux, A.Plain, A.Ricard (Lab. de Phys. des Gaz et des Plasmas, Univ. Paris-Sud, Orsay, France), M.Capitelli, C.Gorse.
J. Phys. B (GB), vol.16, no.10, p.1863-74 (28 May 1983).
The excitation and ionisation number densities of different states of N_2 have been measured in a long positive column of a glow discharge in flowing N_2 when the residence time of excited species in the column was varied between 5×10^{-4} and 2.5×10^{-1} s. The vibrational population of the ground state N_2 $(X\ ^1\Sigma_g{}^+,\ \nu)$ and the electron energy distribution function (EDF) have been calculated for different values of gas pressure, electric field and electron densities. For residence times greater than 10^{-2} s the $N_2(X,\nu)$ and the EDF tails are strongly overpopulated. The vibrational population of the excited states $N_2(C^3\Pi_u,\nu')$ and $N_2{}^+(B^2\Sigma_u{}^+,\nu')$ have been experimentally determined by measuring the second positive and first negative band intensities. The measured $N_2(C,\nu')$ distributions are in good agreement with the calculated populations assuming that the $C^3\Pi_u$ state is created by electron collisions and destroyed by radiative emission. The ionic lines emitted from $N_2{}^+(B,\nu')$ have large intensities for long residence times $t>10^{-2}$ s suggesting that the heavy particle reaction: $N_2(X,\nu\geq12)+N_2{}^+(X)\rightarrow N_2(X)+N_2{}^+(B)$ is the main process. (21 refs.)

71003 *n*-changing collisions in intermediate Rydberg states of Li induced by collisions with ground-state parent atoms. B.Dubreuil (Groupe de Recherches sur l'Energetique des Milieux Ionises, CNRS, Univ. d'Orleans, Orleans, France).
Phys. Rev. A (USA), vol.27, no.5, p.2479-84 (May 1983).
Two-step laser-induced-fluorescence techniques are used to investigate n-changing collisional processes $Li(n=9)+Li(2^2S)\rightarrow Li(n'\neq n)+Li(2^2S)+\Delta E_{nn'}$ in a temperature-controlled lithium heat-pipe oven. Numerical identification of the resonance- and collision-induced fluorescences with the hydrogenic rate equations describing the time variation of the $n=7$, 8, 9, 10, 11 populations allows the determination of collisional transfer and quenching rate coefficients. n-changing collisions with $\Delta n=|n-n'|=1$ predominate, and the quenching rate coefficients are found nearly independent of n: $k_n\sim1.3\times10^{-9}$ $cm^3\ s^{-1}$. 34.70 CHARGE TRANSFER

(see also 82.30 Charge transfer reactions)

71004 Electron emission in asymmetric collisions with fast, heavy projectiles via continuum charge transfer. D.H.Jakubassa-Amundsen (Phys.-Dept., Tech. Univ. Munchen, Garching, Germany).
J. Phys. B (GB), vol.16, no.10, p.1767-81 (28 May 1983).
The ejection of electrons from light target atoms by bare heavy projectiles is described by means of electron capture to the continuum. Calculations of the energy distribution of the electrons are performed within the semiclassical impulse approximation and compared with other theories. As special cases, collisions of Kr with H and Ar with He are considered. Experimental data of the electron spectrum in the forward peak region in (Ar,He) collisions can be well explained. (25 refs.)

71005 A note on the asymptotic behaviour of asymmetric charge transfer theories. L.J.Dube (Fakultat fur Phys., Univ. Freiburg, Freiburg, Germany).
J. Phys. B (GB), vol.16, no.10, p.1783-91 (28 May 1983).
The author reduces the problem of finding the leading velocity dependence of the peaked impulse approximation (PIA), the impulse approximation (IA) and the strong-potential Born (SPB) approximation to that of examining the asymptotic behaviour of the double scattering amplitude in the second Born (B2) approximation. Although no strict mathematical proof is given, he presents evidence (both theoretical and numerical) that this procedure is indeed justified. In contrast to the ν^{-11} dependence of the B2 approximation, the post (prior) form of the PIA gives rise to a leading $\nu^{-11-2l'}$ (ν^{-11-2l}) velocity dependence irrespective of the final (initial) orbital quantum number l (l'). The origin of this discrepancy is discussed and new insight on the use of the peaking approximation is gained. He infers that the asymptotic behaviour (to leading order only) of the IA and SPB approximation agrees with that of the B2 approximation. (28 refs.)

71006 Charge exchange in low-energy $^{3}\mathrm{He}^{+}$-$^{4}\mathrm{He}^{2+}$ collisions. C.A.Falcon (Lab. d'Astrophys., Univ. de Bordeaux I, Talence, France).
J. Phys. B (GB), vol.16, no.10, p.1793-8 (28 May 1983).
Differential scattering cross sections for resonant charge transfer in $^{3}\mathrm{He}^{+}$-$^{4}\mathrm{He}^{2+}$ collisions are calculated in the centre-of-mass energy range of 20 to 100 eV using a quantal formalism of the perturbed stationary-state method. The corresponding partially-integrated cross sections are presented as a function of the acceptance angle of the detector in a typical scattering experiment. The comparison with the merging beam experiments of Jognaux et al. (1978) would indicate that the experimental results are difficult to reconcile with theoretical considerations. (9 refs.)

71007 Capture of Ar K-shell electrons by protons. E.Horsdal-Pedersen, C.L.Cocke (Phys. Dept., Kansas State Univ., Manhattan, KS, USA), J.L.Rasmussen, S.L.Varghese.
J. Phys. B (GB), vol.16, no.10, p.1799-804 (28 May 1983).
The total cross section for the capture of a K-shell electron from Ar by a fast proton has been measured at kinetic energies from 1.5 to 10 MeV. To ensure that the total cross section was indeed obtained the authors also measured the K-shell capture probability as a function of impact parameter at selected energies within the interval 1.5-4 MeV. The cross sections obtained are somewhat higher than previously published cross sections. The reason for the discrepancy is discussed. The new cross sections are compared with recent theoretical cross sections. (19 refs.)

71008 Charge transfer of O^{3+} ions in collisions with atomic hydrogen. S.Bienstock (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA), T.G.Heil, A.Dalgarno.
Phys. Rev. A (USA), vol.27, no.5, p.2741-3 (May 1983).
Cross sections are calculated for the charge transfer of O^{3+} ions in collisions with hydrogen atoms. The cross sections are in satisfactory agreement with ion-trap measurements at energies near 2.5 eV and with ion-beam measurements between 40 eV and 5 kev. The calculated cross sections uniformly exceed the ion-beam values by about 25%. The discrepancy, if real may be attributed to the presence of less reactive metastable ions in the beam. The theory demonstrates that the charge-transfer process results in the emission of visible and ultraviolet photons of specific wavelengths whose detection would serve as a diagnostic probe of the detailed mechanism by which charge transfer proceeds. (10 refs.)

71009 Collective effects in atomic collisions. I. Constrained Hartree-Fock approach for diatomic systems. J.Eichler, Tàk San Ho (Bereich Kern- und Strahlenphys., Hahn-Meitner-Inst. fur Kernforschung, Berlin, Germany).
Z. Phys. A (Germany), vol.311, no.1-2, p.19-27 (1983).
As a first step towards a collective treatment of charge flow in harmonic collisions, the authors construct ab initio potential energy surfaces as a function of the internuclear distance and the charge asymmetry between the two atomic species. To this end, the charge asymmetry of its stability value for a given nuclear separation is imposed upon the system by a suitable constraint within a two-centre Hartree-Fock calculation. Energy surfaces are presented for the systems LiH, HF, LiF, and CO. This representation offers a conceptual framework for visualising ionic or covalent molecular states and trajectories describing charge-changing collisions. (24 refs.)

71010 Collective effects in atomic collisions. II. Dynamics of charge flows in diatomic collision systems. J.Eichler, Tak San Ho (Bereich Kern- und Strahlenphys., Hahn-Meitner-Inst. fur Kernforschung, Berlin, Germany).
Z. Phys. A (Germany), vol.311, no.1-2, p.29-36 (1983).
For pt.I see ibid., vol.311, p.19-27 (1983). The dynamics of collective charge flow in slow quasimolecular collision systems is investigated. In a first step, a classical Hamiltonian function is derived from a generalised Born-Oppenheimer approach. In a second step, the resulting coupled equations of motion for the relative coordinate and the charge asymmetry between the two atomic species are solved. As an illustration of the method, trajectories are presented for the model system HF. They exemplify elastic and charge-changing collisions as well as trapping into a molecular state. It is suggested that the mechanism studied might play a role in slow collisions of multicharged ions with neutral target atoms. (30 refs.)

71011 Alignment and orientation of charge exchange excitation with polarized projectiles. S.M.Khalid, H.Kleinpoppen (Atomic Phys. Lab., Univ. of Stirling, Stirling, Scotland).
Z. Phys. A (Germany), vol.311, no.1-2, p.57-66 (1983).
The alignment and orientation of hydrogenlike excited atoms produced by electron capture in collisions of spin polarized bare atomic nuclei with atomic targets is described in terms of Stokes parameters. The $H(2p)^{*}$ excited state formed by spin polarized protons making charge exchange collisions on atomic targets is dealt with extensively for the purpose of illustration. The linear polarization and circular polarization of resulting Lyman-α when polarized protons make electron capture collision on atomic hydrogen target are plotted to compare observable aspects of different theories of electron capture. (15 refs.)

34.80 ELECTRON SCATTERING

34.80B Elastic scattering of electrons by atoms and molecules

71012 A self-consistent field approach to atomic scattering: application to low energy positron-hydrogen scattering and annihilation. M.Horbatsch, J.W.Darewych, R.P.McEachran (Phys. Dept., York Univ., Toronto, Ontario, Canada).
J. Chem. Phys. (USA), vol.78, no.9, p.5564-6 (1 May 1983).
The authors consider a formalism for light-particle scattering by atoms in which the wave function is written as a sum of two parts $\Phi_0+\Phi_c$. The first Φ_0 is written as a usual eigenfunction expansion sum (real and/or pseudostate) that contains all the open channels. Φ_c is taken to be a self-consistent Slater-type wave function which is used to describe the system when all particles are in proximity of the nucleus, including possibly correlation effects. The method is tried on low energy e^{+}-H scattering. The calculated phase shifts and Z_{eff} are compared to those of other calculations. The calculated phase shifts are close to the 'exact' results. (7 refs.)

71013 Electron scattering in intense laser fields. A.Weingartshofer, J.K.Holmes, J.Sabbagh, S.L.Chin (Dept. of Phys., St. Francis Xavier Univ., Antigonish, Nova Scotia, Canada).
J. Phys. B (GB), vol.16, no.10, p.1805-17 (28 May 1983).
The authors report quantitative measurements of multiphoton free-free (FF) transitions in a controlled three-beam experiment: electrons elastically scattered from argon in the presence of a CO_2 laser pulse having an average flux density between 10^{6} and 10^{8} W cm^{-2}. They present FF spectra for four incident electron energies, two scattering angles, and two directions of the laser polarisation vector. Electrons that have changed their kinetic energy by as many as eleven photons have been detected. From the spectra the absolute average flux density of the laser pulse was determined and the validity of the sum rule examined. Both results are indirect verifications of the theory. (27 refs.)

71014 Elastic scattering of slow electrons from Ar and Kr atoms. F.Kemper, B.Awe, F.Rosicky, R.Feder (Theoretische Festkorperphys., Univ. Duisburg GH, Duisburg, Germany).
J. Phys. B (GB), vol.16, no.10, p.1819-25 (28 May 1983).
The spin polarisation and the differential cross section of unpolarised electrons, scattered elastically from Ar and Kr atoms in the energy range 10-50 eV, have been calculated relativistically using an effective local potential. Two different exchange-correlation approximations and an absorptive potential part were employed. The authors' results for Kr are generally in good agreement with experimental data. For Ar, they find only partial agreement with the data but good agreement with earlier theory at energies and scattering angles at which there are severe discrepancies with the data. (12 refs.)

71015 Elastic and inelastic scattering of high-energy electrons and X-rays by NH_3, CH_4 and H_2O molecules. B.S.Sharma, A.N.Tripathi (Dept. of Phys., Univ. of Roorkee, Roorkee, India).
J. Phys. B (GB), vol.16, no.10, p.1827-35 (28 May 1983).
A study of elastic and inelastic differential cross sections for high-energy electrons and X-rays has been carried out with a SCF-MO wavefunction obtained in a double-zeta-quality basis of Gaussian contracted functions of Snyder and Basch (1972). The results obtained with this wavefunction were in reasonably good agreement with the recent measurements and other theoretical calculations. (32 refs.)

34.80D Atomic excitation and ionization by electron impact

71016 Oscillator strengths and collision strengths for S II. Y.K.Ho, R.J.W.Henry (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.886-90 (15 April 1983).
Collision strengths for electron impact excitation of S II from the ground $3s^{2}3p^{3}\ {}^{4}S^{0}$ state to excited states $3s3p^{4}\ {}^{4}P$, $3s^{2}3p^{2}4s\ {}^{4}P$, and $3s^{2}3p^{2}3d\ {}^{4}P$ are calculated in a close-coupling approximation for the energy range up to 10^{6}K. Also given are oscillator strengths for these transitions and a number of others which involve $3s^{2}3p^{3}\ {}^{2}D^{0}$ and ${}^{2}P^{0}$. Configuration interaction target wave functions, which give oscillator strengths accurate to 30% (except in certain cases), are used in the calculation of collision strengths. (31 refs.)

71017 What we do and do not know about electron impact excitation of atomic hydrogen. J.Callaway, M.R.C.McDowell (Maths. Dept., Royal Holloway Coll., Egham, England).
Comments At. & Mol. Phys. (GB), vol.13, no.1, p.19-35 (1983).
The present state of knowledge derived from both theoretical and experimental information on electron impact excitation of atomic hydrogen is briefly reviewed. Suggestions are made for further calculations and for additional experiments. (26 refs.)

71018 Multipole interference in the excitation of helium by simultaneous electron and laser photon impact. R.S.Pundir, K.C.Mathur (Dept. of Phys., Univ. of Roorkee, Roorkee, India).
Phys. Lett. A (Netherlands), vol.95A, no.3-4, p.148-51 (25 April 1983).
New theoretical results for the excitation of helium by simultaneous electron and photon impact are presented at an incident electron energy of 200 eV and in the photon wave number regions 186103-186108 cm^{-1}, 186205-186214 cm^{-1}, 191444-191449 cm^{-1} and 191488-191497 cm^{-1}. Significant changes in the cross sections due to the multipole interference effect are predicted in the regions close to the 3^{1}D and 4^{1}D resonances. (15 refs.)

71019 Angular distribution for electron excitation of the $4^{2}S\rightarrow4^{2}P$ transition in ZnII: comparison of experiment and theory. A.Chutjian (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), A.Z.Msezane, R.J.W.Henry.
Phys. Rev. Lett. (USA), vol.50, no.18, p.1357-60 (2 May 1983).
Differential electron-scattering cross sections for inelastic excitation of an ion have been measured for the first time. Experiments were carried out in a crossed electron-ion-beam geometry for the $4^{2}S\rightarrow4^{2}P$ transition in ZnII at 75 eV. In addition, differential cross sections were calculated at energies between 15 and 100 eV in a five-state close-coupling approximation in which $4s$, $4p$, $3d^{9}4s^{2}$, $5s$, and $4d$ states were included. Agreement in shape between theory and experiment at 75 eV is excellent. (17 refs.)

71020 Measurement of Ne $2p^{5}$ $3p$ lifetimes by laser-electron-impact double excitation employing the delayed-coincidence method. I.Tanarro, F.Arqueros, J.Campos (Catedra de Fisica Atomica Experimental, Ciudad Univ., Madrid, Spain).
Phys. Rev. A (USA), vol.27, no.5, p.2533-6 (May 1983).
Radiative lifetimes of six Ne $2p^{5}$ $3p$ states have been measured with uncertainties lower than 1.5% by means of a pulsed electron excitation laser-induced fluorescence technique. This method allows one to obtain fluorescence signals by exciting from resonant as well as from metastable levels at low pressures. The lifetime results are 14.0 ± 0.1, 17.9 ± 0.1, 16.9 ± 0.2, 20.2 ± 0.1, 19.0 ± 0.2, and 20.6 ± 0.2 nsec for the $2p_1$, $2p_2$, $2p_3$, $2p_4$, $2p_5$ and $2p_6$ levels, respectively. (23 refs.)

34.80G Molecular excitation, ionization, and dissociation by electron impact

71021 Non-Maxwellian electron velocity distribution resulting from electron-SF_6 attachment collisions. R.Schmidt, W.Stiller (Central Inst. for Isotope & Radiation Res., Acad. of Sci., Leipzig, Germany).
Beitr. Plasma Phys. (Germany), vol.23, no.1, p.41-9 (1983).
A model reaction system is considered consisting of a heat bath of argon atoms (c) and small concentrations of SF_6-molecules (m) and electrons (e) (number densities: $n_e \ll n_m \ll n_c$). Within the model the time behaviour of the electron velocity distribution function is studied under the influence of elastic electron-argon collisions and electron SF_6 attachment collisions. On the basis of the distribution function time-dependent macroscopic quantities (kinetic electron temperature nonequilibrium rate constant of the attachment reaction) are calculated. (9 refs.)

71022 Electron impact excitation of methane. L.Vuskovic, S.Trajmar (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.4947-51 (15 April 1983).
Electron energy-loss spectra covering the elastic and inelastic region up to 15.0 eV were obtained at 20, 30, and 200 eV impact energies at scattering angles ranging from 8° to 130°. Relative differential elastic scattering cross sections were determined at each impact energy and then, normalized to the absolute scale by utilizing the 100° differential cross sections of Tanaka et al. (private communication) at 20 and 30 eV and to theory [Dahl et al. J. Phys. B, vol.12, p.2727 (1979)] at 200 eV. The inelastic region of the energy-loss spectrum was divided into five ranges. From the integrated scattering intensities over these ranges with respect to the elastic scattering and from the normalized elastic cross section, the inelastic cross sections were calculated. (38 refs.)

71023 Electron impact excitation from $a^1\Delta_g$ state of molecular oxygen. M.A.Khakoo, W.R.Newell, A.C.H.Smith (Dept. of Phys. & Astron., Univ. Coll. London, London, England).
J. Phys. B (GB), vol.16, no.10, p.L317-22 (28 May 1983).
Energy-loss features observed in the electron impact excitation of discharged molecular oxygen are assigned to the transitions O_2 a $^1\Delta_g$ $(\nu=0) \rightarrow O_2$ $^1\Pi_u$ $(\nu'=0, 1, \ldots 7)$. A Morse potential energy curve is determined for the $^1\Pi_u$ state using the relative intensities of these energy-loss features. (12 refs.)

71024 Vibrational excitation of SO_2 by electron impact via the 3.4 eV resonance. L.Andric (Lab. de Phys. et Optique Corpusculaires, Univ. Pierre et Marie Curie, Paris, France), I.Cadez, R.I.Hall, M.Zubek.
J. Phys. B (GB), vol.16, no.10, p.1837-51 (28 May 1983).
Resonant electron scattering from SO_2 has been observed in the 2.5 to 4.5 eV energy region. Vibrational excitation of the ν_1 mode with up to 23 quanta has been detected with some additional bending quanta. The angular behaviour of the absolute differential cross sections allied to configuration arguments indicate a shape resonance of B_2 symmetry. A reasonable theoretical description was obtained with the boomerang model but a weakness in the usual model for Γ was brought to light. (17 refs.)

71025 Mass spectrometric investigation of NH_3 and CO_2 cluster ions: appearance potentials and stability. K.Stephan, T.D.Mark, J.H.Futrell, A.W.Castleman,Jr. (Abteilung fur Kernphys. und Gaselektronik, Inst. fur Experimentalphys., Leopold Franzens Univ., Innsbruck, Austria).
Vacuum (GB), vol.33, no.1-2, p.77-85 (Jan.-Feb. 1983). (Proceedings of the 2nd Joint Meeting of the Roland Eotvos Physical Society (Vacuum Physics and Thin Films Sections) and the Austrian Vacuum Society, Brunn am Gebirge, Austria, 27-29 Oct. 1981).
Electron impact ionization of $(CO_2)_x$ and $(NH_3)_y$ (x up to 5, y up to 10) was investigated in a molecular beam experiment coupled with a double focusing mass spectrometer. A special ion optical system and operating mode (deflection method) was used to discriminate between beam species and background species. For both neat and seeded (He, Ar, Kr) beams the authors have studied neutral cluster beam properties. The exothermicity of the reaction of $CO_2{}^+$ with CO_2 to form $(CO_2)_2{}^+$ was found to be 17.1±5 kcal/mole in good agreement with previous high pressure mass spectrometry determinations. The dissociation energy for the proton bound dimer to $NH_4{}^+ + NH_3$ was found to be 0.60±0.2 eV. In addition, metastable transitions occurring in the mass spectrum of C_3H_8, N_2O and $(CO_2)_x$, $(NH_3)_y$ were investigated by means of decoupling the acceleration and deflection fields of the mass spectrometer, yielding the first results on the stability of cluster ions. (47 refs.)

71027 Deuterium separation by multiple-photon dissociation of 2,2-dichloro-1, 1, 1-trifluoroethane in a two-frequency CO_2 laser field. Pan Daren, Tan Ji-chun (Dept. of Phys., Sichuan Univ., Sichuan, China).
Chin. Phys. (USA), vol.3, no.1, p.137-42 (Jan.-March 1983). [received: May 1983]
Multiple-photon dissociation of CF_3CDCl_2-CF_3CHCl_2 gas mixture in the field of two-frequency CO_2 laser light is studied. The authors obtained a single-step deuterium isotopic enrichment factor of 1600, which is significantly bigger than that obtained by single-frequency CO_2 laser irradiation. (6 refs.)

71028 Separation of Li isotopes by laser deflection of atomic beam. Li Li, Wang Yinde, Li Mingguang, Wang Chongye, Li Junxiang, Huang Shangjun, Shi Fangyong, Cai Zengliang, Fing Ze, Yu Shiying, Zhang Yi, Zhu Qingshi (Qinghai Inst. of Salt Lake, Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.1, p.155-8 (Jan.-March 1983). [received: May 1983]
Separation of Li isotopes by laser deflection of atomic beams has been carried out. An atomic beam apparatus with a collimating ratio of 450/1 generates a Li atomic beam of 10^9 atoms/cm^3 at the oven temperature of 600°C. The CW tunable dye laser crossing the atomic beam at a right angle has a linewidth of 6 MHz and its intensity at the 1 cm interaction area is about 70 mW/cm^2. When the laser frequency is tuned to coincide with $^7Li 2^2P_{3/2} F=3-2^2S_{1/2} F=2$ transition, ^7Li atoms are deflected from the beam. The deflected atoms are very pure ^7Li and almost do not contain ^6Li. When the laser frequency coincides with any other transition of 2^2P-2^2S of both ^6Li and ^7Li, no apparent deflection is observed because of the optical pumping of the hyperfine levels of the $2^2S_{1/2}$ ground state. (4 refs.)

71029 Possibility of separating the isotopes ^{127}I and ^{129}I with the aid of a photodissociation iodine laser. T.L.Andreeva, S.V.Kuznetsova, A.I.Maslov, I.I.Sobel'man, E.A.Yukov.
J. Sov. Laser Res. (USA), vol.4, no.1, p.91-7 (Jan.-Feb. 1983).
A method for separating iodine isotopes is proposed, based on the large difference between the rate constants of the excited $I^*(^2P_{1/2})$ and unexcited iodine atoms with radicals CF_3 and with Cl_2 molecules, and on the possibility of selectively acting on the ^{127}I atoms in the states $^2P_{1/2}$ and $^2P_{3/2}$ by radiation from a photodissociation $R^{127}I$ iodine laser ($\lambda=1.315$ μm). The possibility of separating the pure isotope ^{129}I and the mixture ^{127}I with ^{129}I is investigated. (14 refs.)

71030 Independent cross-sections of alkali isotopes produced in various targets bombarded by ^{12}C and ^{18}O ions up to 77 MeV/amu. M.de Saint Simon, P.Guimbal, A.C.Mueller, G.Audi, A.Coc, M.Epherre, S.Haan, M.Langevin, C.Thibault, F.Touchard (CSNSM, Orsay, France).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.48
The authors report on an online mass-spectrometric study of the isotopic distributions of nuclear reaction products. The two purposes of this experiment are the investigation of a particular aspect of reaction-mechanisms and the study of the possibility for exotic-nuclei production. The measurements have been carried out with the 86 MeV/amu ^{12}C and ^{18}O beams of the synchrocyclotron SC (CERN). By degradation in different sets of graphite slabs, three different energies: 13, 27 and 77 MeV/amu have been chosen. Due to the chemical selectivity for the alkali elements of the device, the isotopic distributions of Li, Na, K, Rb, Cs and Fr were measured in four targets: C, Nb, Ta and U. The independent yields obtained by direct ion counting are converted in cross-sections using a calibration of T. Lund et al. (no refs.)

35.10F Relativistic corrections, fine- and hyperfine-structure constants

71031 Measurement of fine and hyperfine structures and isotope shift in 2^2P-2^2S transitions of lithium by laser induced fluorescence of atomic beams. Li Mingguang, Wang Yinde, Wang Chongye, Li Li, Shi Fangyong, Yu Shiying, Huang Shangjun, Cai Zengliang, Li Junxiang, Feng Ze, Zhang Yi, Zhu Qingshi (Qinghai Inst. of Salt Lake, Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.1, p.143-8 (Jan.-March 1983). [received: May 1983]
The fine and hyperfine structures and the isotopic shift in the 2^2P-2^2S transitions were recorded when a lithium atomic beam with 4.7×10^{-3} radian divergence was irradiated perpendicularly by a CW tunable dye laser beam with 6-MHz linewidth, which was continuously scanned over 30-GHz range. The electronic spin coupling splittings in 2^2P terms of ^6Li and ^7Li have been measured to be 9.7±0.4 GHz and 10.5±0.5 GHz respectively and the isotopic shift in the $^2P_{1/2}$ term is 10.7±0.6 GHz. Within tuning range over 2.5 GHz and at laser intensity 4 mw/cm^2 and at 460°C oven temperature, the spacings of the successive lines in the ^7Li $^2P_{1/2} \leftarrow 2^2S_{1/2}$ transitions have been

measured to be 88±11 MHz, 730±73 MHz, and 92±7 MHz respectively; the recorded linewidth was 22 MHz. The linewidth and relative intensities are discussed. (9 refs.)

71032 Precise determination of the ground state hyperfine splitting of $^{135}Ba^+$. W.Becker, G.Werth (Inst. fur Phys., Univ. Mainz, Mainz, Germany).
Z. Phys. A (Germany), vol.311, no.1-2, p.41-7 (1983).
A microwave-optical double resonance experiment has been performed on $^{135}Ba^+$ ions, confined in a RF quadrupole trap. Linewidths as narrow as 0.9 Hz have been obtained on the 7.18 GHz, $F=1$, $m=0$ to $F=2$, $m=0$ transition. Shifts of the resonance frequency due to magnetic stray fields and the electric trapping field have been observed. The final result, extrapolated to zero field strengths, is $\Delta\nu_{HFS}=7183340234.90$ (0.57) Hz. (19 refs.)

71033 Fine-structure and tensor polarizabilities of $1snd^3D$ levels of He I ($n=3$ to 7). W.-D.Perschmann, G.von Oppen, D.Szostak (Inst. fur Strahlungs- und Kernphys., Tech. Univ. Berlin, Berlin, Germany).
Z. Phys. A (Germany), vol.311, no.1-2, p.49-56 (1983).
Using level crossing techniques the fine-structure splittings and tensor polarizabilities of the $1snd^3D$ levels of He I with $n=3$ to 7 have been measured. For excitation the authors used 35 keV He^+-He collisions. Magnetic and electric fields perpendicular to the ion beam have been applied to the target volume. Precision values of the large fine-structure interval $(n^3D_1-n^3D_2)$, of the small one $(n^3D_2-n^3D_3)$, and of the tensor polarizabilities have been determined. (24 refs.)

35.20B General molecular conformation and symmetry; stereochemistry

71034 Molecular structure of an aminosilane coupling agent as influenced by carbon dioxide in air, pH, and drying conditions. S.Naviroj, J.L.Koenig, H.Ishida (Dept. of Macromolecular Sci., Case Western Reserve Univ., Cleveland, OH, USA).
J. Macromol. Sci. - Phys. (USA), vol.B22, no.2, p.291-304 (1983).
The molecular structures of the hydrolyzates of γ-aminopropyltriethoxysilane (γ-APS) were studied by Fourier transform infrared spectroscopy (FT-IR). The molecular structure of γ-APS is a function of the pH of the solution and the drying conditions. In the partially cured film, cast from a 20% by weight γ-APS aqueous solution at pH=2, the amine group exists as a protonated amine; and at pH=12 the amine group exists as a free NH_2. The amine group exhibits different structures subject to drying conditions when prepared at natural pH. The sample dried in nitrogen exhibited hydrogen bonding between the SiOH and the NH_2 group. Upon heating, the silanol groups condense and the amine groups no longer hydrogen bond. The increase in the availability of free amine groups was indicated by larger amounts of exchange of NH_2 to ND_2 when the sample was exposed to D_2O vapor. When the hydrolyzed γ-APS at natural pH was dried in CO_2 or in air, a bicarbonate structure was formed, causing the appearance of bands at 1630, 1575, 1488, and 1332 cm^{-1}. E-glass fibers were treated with 2% γ-APS and dried under different conditions, which show the various structures of γ-APS as described above. Differences in γ-APS structures may affect the curing reactions of composite materials. (24 refs.)

71035 Investigation of the structure and intramolecular interaction in phenylthiolene-1,1-dioxides. M.Yu.Antipin, T.E.Bezmenova, G.V.Klimusheva, G.G.Rode, Yu.T.Struchkov.
Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.553-9 (April 1983). In Russian.
The structure parameters of three phenyl thiolene-1,1-dioxides compounds differing only in a position of a carbon double bond in a 5-member fragment are studied by the X-ray diffraction method. A comparative analysis of the three structures is carried out from the standpoint of their intramolecular interaction which induces differences in their molecular structures. The obtained argumentation relative to the interaction character in the compounds is in good agreement with their spectral data. (16 refs.)

71036 Structure and quadrupole coupling measurements on the NO dimer. S.G.Kukolich (School of Chem. Sci., Univ. of Illinois, Urbana, IL, USA).
J. Mol. Spectrosc. (USA), vol.98, no.1, p.80-6 (March 1983).
Rotational transition frequencies for ^{14}NO-^{14}NO, ^{14}NO-^{15}NO, and ^{15}NO-^{15}NO were measured using a pulsed-nozzle Fourier transform microwave spectrometer. Rotational constants for the different isotopic combinations allowed an unambiguous structure determination. The molecule is in a cis planar structure with a bond between the nitrogen atoms and an NNO angle $\theta=99.6(2)^\circ$. The N-N bond length is 2.236(1) Å and the NO bond length is 1.161(4) Å. Hyperfine structure due to nitrogen quadrupole coupling and spin-rotation interactions was observed and analyzed. Rotation constants, quadrupole coupling tensor, and spin-rotation tensor elements are given. (10 refs.)

35.20G Bond strengths, dissociation energies, hydrogen bonding, etc

71037 On vibrational bonding of IHI. J.Manz (Tech. Univ. Munchen, Garching, Germany), R.Meyer, J.Romelt.
Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.607-12 (29 April 1983).
The vibrational bond of IHI is described in analogy to the covalent bond of H_2^+ by a Born-Oppenheimer-type separation of light ('hydrogenic'≙'electronic') and heavy ('iodines'≙ 'protons') particle degrees of freedom. Competing potential energy decreases and hydrogen zero-point energy increases (for the IHI antisymmetric stretching and bending modes) yield a minimum in the iodine symmetric stretching mode's potential energy which supports one bound vibrational IHI state. 71038 Diamagnetic anisotropy of some hydrogen-bonded molecules. M.M.Abdel-Kader (Phys. Dept., Univ. of Cairo, Giza, Egypt).
Acta Phys. Pol. A (Poland), vol.A63, no.4, p.539-46 (April 1983).
The tensor diamagnetic susceptibilities (χ_1, χ_2 and χ_3) of four aromatic compounds namely 1- and 2-naphthoic acid and α- and β-naphthol were measured. From these measurements and the orientation of molecules as given from the crystal structures of these compounds, the principal molecular susceptibilities (K_1, K_2 and K_3) have been calculated. The observed magnetic anisotropies and other magnetic data are interpreted on the basis of the crystal structures and the system of hydrogen bonds of these molecules. (26 refs.)

71040 Calculation of vertical ionization potentials of hydrogen peroxide by perturbation corrections to Koopmans' theorem. T.Minato, D.P.Chong (Dept. of Chem., Univ. of British Columbia, Vancouver, BC, Canada).
Can. J. Chem. (Canada), vol.61, no.3, p.550-2 (March 1983).
Vertical ionization potentials (VIPs) of hydrogen peroxide are calculated by perturbation corrections to Koopmans' theorem and its conformation is investigated on the basis of the calculated VIPs. The calculated VIPs compare well with the observed values. The analysis based on the VIPs gives a reasonable conformation, although the energy-optimizing procedure cannot reproduce the skew conformation. The lone pair-lone pair interactions are also discussed. (8 refs.)

36.20 MACROMOLECULES AND POLYMER MOLECULES

(for biological macromolecules, see also 87.15; for polymer reactions and polymerization, see 82.35)

71042 Problem of multiple lines in absorption bands in the infra-red spectra of urethanes and polyurethanes. L.I.Maklakov, V.L.Furer, A.L.Furer.
Vysokomol. Soedin. Ser. B (USSR), vol.25, no.3, p.162-5 (1983). In Russian.
Previously Maklakov et al. (Zh. Prikl. Spektroskopii, vol.34, no.2, p.270 (1981)) studied the vibrational spectra of methyl-N-methylcarbonate and concluded that shifts and branches in IR lines arise due to molecular clusters of various lengths. An attempt is made to reveal similar interactions between bonds and valence angles in associated molecules, affecting the amide lines in the IR spectra of polyamides, based on a model of hydrogen-bonded dimers and trimers in polyurethanes. The model is shown to account satisfactorily for band splitting in the IR absorption spectra of polyurethanes. (7 refs.) *C.J.S.*

71043 Link between the conformation of macromolecules and the morphology of polyoxymethylene. B.V.Ozeretskovskii (Inst. Chem. Phys., Acad. of Sci., USSR).
Vysokomol. Soedin. Ser. B (USSR), vol.25, no.3, p.193-7 (1983). In Russian.
Polyoxymethylene is chosen for the present study since its macromolecular conformation in the crystalline state is known. A comparison is presented of all the atomic group absorption bands, and the conditions of formation of various super-molecular structures are studied. Spherolite and hedrite formation can occur during crystallisation from a melt or from solution, and these processes are studied in terms of the measured IR spectra, which are particularly sensitive to conformational changes in the macromolecular vibrational frequency in the range 700-1400 cm^{-1}. A wide range of polymeric chain conformation at conditions far from equilibrium, which leads to a dissipative system. In such a system each morphological form has a specific conformational set. (7 refs.) *C.J.S.*

71044 Phase transition in a model of long polymers with excluded volume. N.Angelescu, V.B.Priezzhev (Joint Inst. for Nuclear Res., Dubna, USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.913-19 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.453-62 (Sept. 1982). [received: May 1983]
A model of long polymers interacting with one another through repulsive forces with an additional intramolecular interaction between neighboring atoms in a polymer chain is proposed. The existence of a thermodynamic limit of the free energy for such a system is proved. It is shown by the method of reflectional parity that the system undergoes a phase transition, i.e. the free energy is identically equal to zero at a temperature below a certain fixed temperature (ground state) and different from zero at high temperatures. 36.40 ATOMIC AND MOLECULAR CLUSTERS

71045 Structure and stability of Li_4 and Li_6 clusters. D.Plavsic, J.Koutecky, G.Pacchioni, V.Bonacic-Koutecky (Inst. fur Phys. Chem., Freie Univ. Berlin, Berlin, Germany).
J. Phys. Chem. (USA), vol.87, no.7, p.1096-7 (31 March 1983).
The results of ab initio CI calculations on Li_4 and Li_6 clusters are compared with those recently obtained by Richtsmeier et al. (1982) with the DIM method. The planar sections of the fccub Li crystal lattice exhibiting singlet ground state are the most stable Li clusters. More compact structures such as $Li_4(T_d)$ and $Li_6(O_h)$ are less favored and have a triplet ground state. (7 refs.)

71046 Theoretical formulation of occurrence of microclusters from supersaturated metal vapour in cold inert gas. S.Ozawa, K.Tanikawa.
J. Fac. Eng. Ibaraki Univ. (Japan), no.30, p.127-33 (1982).
The process of occurrence of microclusters from supersaturated metal vapour in one dimensional diffusion chamber is formulated on the basis of a kinetic theory of gases. The temperature and the number density of single vapour atoms are determined at various positions in the diffusion chamber. Using these values of the parameters, the number densities of clusters are numerically calculated as a function of time. It has been shown that the most of the clusters are formed within about 1×10^{-6} sec in a narrow region near the cooled wall of the diffusion chamber. The size distribution of clusters is also discussed. (26 refs.)

71047 Critical remarks on a scaling law for inner-shell ionization. B.Muller, J.Reinhardt, W.Greiner (Inst. fur Theoretische Phys., Johann Wolfgang Goethe-Univ., Frankfurt am Main, Germany), G.Soff.
Z. Phys. A (Germany), vol.311, no.3, p.151-5 (1983).
In superheavy quasimolecules the number of created $1s\sigma$-vacancies per collisions $P_{1s\sigma}$ can be evaluated approximately by a simple scaling law. This analytical relation correctly reproduces the measured dependence of $P_{1s\sigma}$ on the impact parameter, bombarding energy and combined nuclear charge $Z=Z_1+Z_2$. It is emphasized, however, that the absolute ionization magnitude is underestimated typically by a factor of four. This discrepancy has been successfully resolved by the inclusion of multi-step excitation processes. The derivation of the normalization constant in a scaling law previously reported by Armbruster's group is incorrect in the framework of first order perturbation theory. (15 refs.)

71048 An accurate scalar potential finite element method for linear, two-dimensional magnetostatics problems. T.W.McDaniel, R.B.Fernandez, R.R.Root, R.B.Anderson (IBM Corp., Rochester, MN, USA).
Int. J. Numer. Methods Eng. (GB), vol.19, no.5, p.725-37 (May 1983).
Assesses the accuracy of a commercially available computer software package for finite element method calculations of magnetostatic fields. The computer program, MSC/NASTRAN, is well known for its wide applicability in structural analysis and heat transfer problems. The authors exploit the fact that the differential equations of magnetostatics are identical to those for heat transfer if the magnetic field problem is formulated with the reduced scalar potential. Consequently, the powerful, optimized numerical routines of NASTRAN can immediately be applied to two- and three-dimensional linear magnetostatics problems. Application of the NASTRAN reduced scalar potential approach to a 'worst case' two-dimensional problem for which an analytic solution is available has yielded much better accuracy than was recently reported for a reduced scalar potential calculation using a different finite element program. Furthermore, the authors' method exhibits satisfactory performance with regard to computational expense and accuracy for a linear electromagnet with an air gap. (10 refs.)

71049 Electrostatic field of two flat equipotential tapes. K.Adamiak (Inst. Elektrotech. Politech. Swietokrzyskiej, Kielce, Poland).
Rozpr. Electrotech. (Poland), vol.27, no.4, p.939-48 (1981). [received: May 1983]
The paper considers the edge problem for the Laplace equation when the surfaces, on which Dirichlet type conditions are assumped, are the internal surfaces of the area for which a solution is sought. The solution has been reduced to a system of Fredholm integral equations of the 1st kind. Calculations have been made of a field coming from 2 thin equipotential tapes. The method of finite differences was used in the calculations. (27 refs.)

71050 Surface modes and optical absorption of a small sphere above a substrate. R.Ruppin (Soreq Nuclear Res. Centre, Yavne, Israel).
Surf. Sci. (Netherlands), vol.127, no.1, p.108-18 (April 1983).
An exact derivation of the electrostatic surface modes of a sphere above a substrate is presented. The absorption spectrum of the sphere is calculated and compared with that of an isolated sphere. The interaction with the substrate causes the main absorption peak to shift to the low frequency side, and also gives rise to additional absorption peaks. The deficiencies of the dipole approximation, which is often used, are discussed. (19 refs.)

71051 Forceless distribution of an axio-symmetrical current. Yu.P.Kovbasenko.
Tekh. Elektrodin. (USSR), no.2, p.9-17 (March-April 1983). In Russian.
An examination is made of a forceless magnetic field possessing axial symmetry and of which the coefficient of proportionality between current density and flux density is of variable magnitude. It is shown that the initial system of equations reduces to the solution of well-studied differential equations. Some particular solutions and the forceless magnetic configurations corresponding to them are analysed. (5 refs.) *A.J.B.*

71052 Electrostatic hazards—a review of modern trends. N.Gibson (Organics Div., Imperial Chem. Industries plc, Manchester, England).
Electrostatics 1983. Sixth Conference on Electrostatic Phenomena, Oxford, England, 13-15 April 1983 (Bristol, England: IOP 1983), p.1-11
The criteria and principles that can be used in the assessment of electrostatic hazards during the handling of liquids and powders in industrial situations are reviewed. Modern trends in the assessment of risk associated with metal plant, nonconductors (plastics), bulk liquid and mists, bulk powder and dust clouds and personnel are discussed. (31 refs.)

71053 Prevention of electrostatic hazards associated with shipboard inert gas operations. J.S.Mills, E.J.Haighton (Thornton Res. Centre, Shell Res. Ltd., Chester, England).
Electrostatics 1983. Sixth Conference on Electrostatic Phenomena, Oxford, England, 13-15 April 1983 (Bristol, England: IOP 1983), p.13-19
During the inerting of a cargo tank on a crude oil or product carrier an electrostatic charge accumulates in the ullage space owing to the carry-over of charged soot particles from the inert gas generator. Shipboard trials have been performed to determine if the resulting space potential attains a value sufficient to generate electrostatic discharges capable of igniting flammable ullage gases if the inert gas system failed and air entered the cargo tanks. It was found that potentials are limited to a value below that needed to generate hazardous brush coronas but may be sufficient to produce hazardous sparks from isolated conductors. (6 refs.)

71054 The ignition of natural gas by spark discharges from the body. N.Wilson (Shirley Inst., Manchester, England).
Electrostatics 1983. Sixth Conference on Electrostatic Phenomena, Oxford, England, 13-15 April 1983 (Bristol, England: IOP 1983), p.21-7
It is known that the ignition of certain flammable gases by spark discharges from the body requires a greater electrostatic energy on the body than the minimum ignition energy of the gas. The three factors which are considered to contribute to this behaviour are (a) the fragmentation of the discharge into discrete sparks, (b) the loss of energy to the body resistance and (c) the quenching effect of the electrodes. The relative importance of these factors is examined for the case of a stoichiometric mixture of natural gas and air. (6 refs.)

71055 Intermittent contact electrification of polymers: simulated and experimental results of polystyrene. J.Fuhrmann, H.J.Streibel (Fachbereich Chem., Univ. Kaiserslautern, Kaiserslautern, Germany).
Electrostatics 1983. Sixth Conference on Electrostatic Phenomena, Oxford, England, 13-15 April 1983 (Bristol, England: IOP 1983), p.145-9
By the help of a reaction kinetic model describing the electrostatic charaging of polymers the time dependent densities of excess electrons in the polymer surface and in the polymer bulk are computed and compared to experimental results. The importance of the band bending during contact and the influence of polymer parameters, e.g. energy level of the polymer band gap states and barrier heights between these levels, and the experimental parameters, such as work function of the contacting metal, contact ratio and contact frequency, on transient and steady-state contact electrification are demonstrated. 71056 Electromagnetic phenomena in solid iron. Z.Cerovsky, B.Heller, M.Stafl (CSAV, Praha, Czechoslovakia).
Acta Tech. CSAV (Czechoslovakia), vol.28, no.1, p.40-9 (1983).
Processes in solid iron are analysed both in the case of an impressed sinusoidally time-dependent exciting current and also of an impressed sinusoidally time-dependent voltage. The formulae derived for both cases allow specifying losses and also determining the phase angle between an impressed quantity of current or voltage and the first harmonic component of the quantity representing the response. As the basis of the theoretical discussion, an idealized rectangular magnetization curve is employed. The response upon a sinusoidally time-dependent current is represented by a voltage with a non-sinusoidal waveform, induced in the coil. In the second case, the response upon an impressed sine voltage is represented by a current with a non-sinusoidal waveform. In the first case, the angular lag between the impressed current and the first harmonic of voltage is $\sigma=27°33'$. In the second case, the angular lag between an impressed voltage and the first harmonic of current is $\sigma=23°$. On the ground of experiments, a correcting coefficient was introduced in calculation of losses, which takes into consideration a real development of a magnetization curve in a ferromagnetic material. (6 refs.)

71057 Current displacement analysis and calculation of impedance in a system of two flat conductors. W.Lipinski, M.Gramz, P.Krason (Inst. Automatyki Przemyslowej Politech. Szczecinskiej, Szczecin, Poland).
Rozpr. Electrotech. (Poland), vol.27, no.4, p.949-58 (1981). [received: May 1983]
A distribution of eddy-current density has been analysed in a system consisting of two flat conductors. A method of impedance calculation has been given for systems which are described by the integral Fredholm equation of the second kind with symmetrical kernel. Examples of the numerical computation have been shown in the form of graphs. (15 refs.)

71058 Diffusion of a transient electromagentic field in a spherical conducting element. J.Golebiowski (Inst. Elektrotech. Politech. Bialostockiej, Bialystok, Poland).
Rozpr. Electrotech. (Poland), vol.27, no.4, p.959-66 (1981). [received: May 1983]
The induction transient $B(t)$ in the centre of a sphere on exciting current step feeding was determined from the vector diffusion equation. The equation was obtained directly without the need to determine the operating transfer function. (8 refs.)

71059 Numerical analysis of the magnetic field of a heating inductor. G.Szymanski (Inst. Elektrotech. Przemyslowej Politech. Poznanskiej, Poznan, Poland).
Rozpr. Electrotech. (Poland), vol.27, no.4, p.1063-70 (1981). [received: May 1983]
A numerical method for calculation of the magnetic field generated outside a nonconducting ferromagnetic bar of infinite length by current flowing through conductors parallel to it is presented. The integral equation approach is applied, which permits an approximate solution of the problem considered. As an example, the magnetic field outside a rectangular bar is calculated using digital computer. The considerations are based on the idealized assumption that the permeability of the ferromagnetic bar is constant. (19 refs.)

71060 Electromagnetic forces in a free jet of a conducting fluid placed in a longitudinal variable magnetic field of a current loop. A.F.Kolesnichenko.
Tekh. Elektrodin. (USSR), no.2, p.7-9 (March-April 1983). In Russian.
The R-networks method is used to solve the equations of an electromagnetic field for a hollow cylindrical jet of conducting fluid placed in a variable magnetic field of a single-turn solenoid. The curve of the electromagnetic forces arising in the jet is determined. (4 refs.) *A.J.B.*

41.10H Electromagnetic waves: theory

71061 Far field radiation patterns of elliptical apertures and its annuli. Y.P.Kathuria (Inst. for Appl. Phys., Darmstadt, Germany).
Opt. Appl. (Poland), vol.12, no.3-4, p.411-17 (1982).
A Fourier transform technique is used to derive expressions for the diffraction field due to elliptical apertures and its annuli. Perspective plots of the intensity distribution diagrams are generated for various values of the axis-ratio with the help of IBM-370/168 computer. All possible cases are discussed briefly. (12 refs.)

71062 A numerical analysis of electromagnetic scattering of perfect conducting cylinders by means of discrete singularity method. M.Nishimura (Maizuru Tech. Coll., Maizuru, Japan), H.Shigesawa.
Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.J66B, no.2, p.245-52 (Feb. 1983). In Japanese.
A computation technique of electromagnetic wave scattering from perfect conducting cylinders with arbitrary cross sections is described. To express the two dimensional scattering wave, the present approach takes account of a set of the solutions of the Helmholtz equation of which singularities are distributed inside the scatterers. The least-squares criterion of the boundry conditions is considered to obtain the optimum scattering field. The validity of the present method is demonstrated in comparison with other methods. (16 refs.)

71063 Coherence of neutron fields. E.Ledinegg, E.Schachinger (Inst. fur Theoretische Phys., Tech. Univ. Graz, Graz, Austria).
Phys. Rev. A (USA), vol.27, no.5, p.2555-65 (May 1983).
Glauber's definition of quantum coherence is used for neutron fields under the assumption that the complete occupation number space is a direct product of Fermi subspaces. As a result, completely coherent microfields are obtained which define a density operator in full analogy to Glauber's P representation of boson fields. For better physical significance, a transformation from the P representation to a momentum representation is performed. It is proved that the second-order coherence function in this representation is equivalent to Wolf's second-order coherence function of a classical Dirac field. Finally, the results of the theory are used to calculate explicitly the second-order coherence function and the coherence time of an ideally collimated neutron beam. (13 refs.)

41.80D Electron beams and electron optics

71064 On aberration theory of the combined electromagnetic focusing cathode lenses. Zhou Li-wei, Ai Ke-cong, Pan Shun-chen (Beijing Inst. of Technol., Beijing, China).
Acta Phys. Sin. (China), vol.32, no.3, p.376-92 (March 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The aberration theory of the combined electromagnetic focusing cathode lenses is described, and the two previous representative papers concerning the aberration theory of cathode lenses, the first contributed by Ximen Jiye (1957) and next by B.E. Bonschtedt (1964), are emphatically analyzed and commented. It is shown that the formulae of aberration coefficients for the cathode lenses given by them, although different in form, can be transformed from one to another; and it is enough to prove that the criticism of B.E. Bonschtedt addressed to Ximen Jiye is improper. It is worth noticing that the aberrations of cathode lenses must be considered at the image plane with regard to $\varepsilon_{z(1)}$—a certain initial energy of electron in axial direction, then the formulae of all the transverse aberrations including the first order and third order aberrations for the combined electromagnetic focusing cathode lenses can be derived. It is expected that these formulae will be closer to practice than those derived formerly. (10 refs.)

71065 Stationary states of a thin inhomogeneous electron beam in external fields. A.S.Chikhachev.
Fiz. Plazmy (USSR), vol.9, no.2, p.378-82 (March-April 1983). In Russian. English translation in: *Sov. J. Plasma Phys. (USA)*
The behaviour of a high-current charged electron beam in longitudinal electric and magnetic fields in a paraxial approximation is studied. For a description of a beam with strong intrinsic fields a self-consistent model is used which is described by an invariant characterising the transverse motion of particles in the beam. 71066 Identification of stratified media based on the Bremmer series representation of the reflection coefficient. H.Kaiser (Sektion Maths. Phys., Paedagogische Hochschule Karl Liebknecht, Potsdam, Germany).
Appl. Opt. (USA), vol.22, no.9, p.1337-45 (1 May 1983).
The identification method is based on approximations of the reflection coefficient r by terms of the Bremmer series. One of these supplies an explicit representation of the refractive-index profile n, utilizing the Fourier transform $\mathfrak{F}r$ of r. Various procedures for the identification of thin-film systems using fast Fourier transform are derived from this relationship between $\mathfrak{F}r$ and n. One main issue of this paper is the determination of jumps within the refractive-index profile. For this purpose a numerical representation of $\mathfrak{F}r$ is subjected to waveform analysis. Theoretical and algorithmic aspects of the method are investigated, including a critical discussion in connection with numerical experiments. (6 refs.)

71067 Light scattering by horizontally oriented spheroidal particles. S.Asano (Meteorological Res. Inst., Ibaraki-ken, Japan).
Appl. Opt. (USA), vol.22, no.9, p.1390-6 (1 May 1983).
Light scattering properties of spheroidal particles oriented randomly with their long axes in the horizontal are studied. A computational scheme has been developed to calculate the scattering matrices as well as the extinction

and scattering cross sections and asymmetry factors in a manner consistent with previous treatment of 3-D orientations. The single scattering properties strongly depend on the elevation angle of incident light. The dependence of the extinction and scattering cross sections is particularly prominent, while the dependence of the single scattering albedo and asymmetry factor is rather small but still significant. For a given elevation angle, the scattering intensity is a function of not only the scattering angle but also the azimuth angle of emergence. Implications of the anisotropic scattering by horizontally oriented nonspherical particles with respect to the elevation angle are also discussed. (20 refs.)

71068 Lambert scattering from a hyperboloid of one sheet. F.A.Spagnolo (Central Intelligence Agency, Washington, DC, USA), J.J.Segedy.
Appl. Opt. (USA), vol.22, no.9, p.1397-401 (1 May 1983).
A generalized vector-matrix method is employed to determine the intensity of diffusely scattered light from a hyperboloid of one sheet. Solutions for both the elliptic and circular cross-section cases are obtained in integral form. For certain limiting conditions the latter results are shown to reduce to a form obtained earlier for a cylinder of circular cross section. (8 refs.)

71069 Mathematical analysis of gratings with circularly concentric grooves. J.M.Elson (Phys. Div., Naval Weapons Center, China Lake, CA, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.702-6 (May 1983).
A mathematical method of analysis of gratings having circularly concentric grooves is presented. The main emphasis is not on the ultimate calculation of the diffracted or scattered fields but rather on reducing the problem to a tractable form with clear physical interpretation, to which the point-matching method can be applied. This is done by starting with the Rayleigh-Fano equation for scattering from rough surfaces. For circular geometry, the problem initially appears intractable. However, by a series of Laplace and inverse Laplace transforms, the problem is reduced to a tractable form. (5 refs.)

71070 Coherence of light scattered by a random phase screen. V.N.Lakhin, R.Yu.Orlov, A.S.Chirkin, F.M.Yusubov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.290-3 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.493-7 (Sept. 1982). [received: May 1983]
The authors present results of near-field measurements of the transverse spatial correlation functions of the field scattered by a random phase screen. These measurements contain more detailed information about the scattering object than does the pattern in the far scattering field. The experimental data are interpreted with the help of the theory developed, taking into account the finite transverse sizes of the phase screen inhomogeneities. (8 refs.)

42.20 PROPAGATION AND TRANSMISSION IN INHOMOGENEOUS MEDIA

71071 Wave-front dislocations: topological limitations for adaptive systems with phase conjugation. N.B.Baranova, A.V.Mamaev, N.F.Philipetsky, V.V.Shkunov, B.Ya.Zel'dovich (Inst. for Problems in Mech., Acad. of Sci., Moscow, USSR).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.525-8 (May 1983).
The density of wave-front dislocations for optical fields as a function of radiation parameters is investigated both theoretically and experimentally. A field with dislocations cannot be conjugated by means of flexible adaptive mirrors. (7 refs.)

71072 Albedo for an inhomogeneous half space. S.A.El Wakil, M.T.Atia, M.H.Haggag (Phys. Dept., Mansoura Univ., Mansoura, Egypt), E.S.Saad.
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.451-6 (May 1983).
The albedo is calculated for an inhomogeneous half-space by assuming that the single scattering albedo behaves like $c(z)=c_0e^{-(z/s)}$. The modified Eddington method is used to obtain the outgoing flux and hence the albedo. Numerical calculations and comparisons with Pomraning et al. (1980) and with an improved version of the F_N- method indicate that the approach is reasonably accurate. (23 refs.)

71073 Determination of the real part of relative refractive-index of spherical particles using scattering-matrix components. E.K.Naumenko, T.V.Oleinik, A.Ya.Khairullina.
Opt. & Spectrosc. (USA), vol.53, no.3, p.288-90 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.489-92 (Sept. 1982). [received: May 1983]
Measurement methods are proposed for the real part of the refractive index of soft spherical particles modeling blood cells and chloroplasts. They are based upon the determination of those angles at which the scattering-matrix elements $f_{33}(n,\kappa,\rho_0,\gamma)=0$ and $f_{34}(n,\kappa,\rho_0,\gamma)=0$. The methods are applicable within the range of values $n=1.02\text{-}1.15$. The relative error of determination of $(n-1)$ does not exceed 15%. (15 refs.)

71074 Statistical screening and the solution of inverse problems. V.A.Krutikov, A.A.Nalivaiko.
Opt. & Spectrosc. (USA), vol.53, no.3, p.293-5 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.498-500 (Sept. 1982). [received: May 1983]
Results are presented of calculating the spectral density fuction of the log-intensity fluctuations for a system of large-scale inhomogeneities in the statistical screening approximation, as well as of numerical modeling of the reconstruction of the distribution function of scattered sizes with an accuracy that is sufficient for practical purposes. (11 refs.)

71075 Effects of partial wave-front reversal during the reflection of waves in randomly inhomogeneous media. Yu.A.Kravtsov, A.I.Saichev (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.2, p.291-4 (Aug. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.2, p.532-8 (Aug. 1982). [received: May 1983]
The effect of partial reversal of the wavefront during the reflection of a wave in a randomly inhomogeneous medium is discussed in detail. It is noted that the presence of the reversed component in the field of the reflected wave leads to the appearance of long-range correlations of the reflected field and the enhancement of the mean intensity of the reflected wave in the focal plane of a lens. 42.30 OPTICAL INFORMATION, IMAGE FORMATION AND ANALYSIS

71076 Set of orthogonal primary aberration coefficients. D.Malacara (Centre de Investigaciones en Optica, AC, Leon, Mexico).
Appl. Opt. (USA), vol.22, no.9, p.1273-4 (1 May 1983).
A set of coefficients in terms of Zernike polynomials *Umm* is described in which the aberrations are represented by their magnitude and orientation in the *x-y* plane. Expressions are presented for wavefront tilt, defocusing, third-order astigmatism, third-order coma, triangular astigmatism, spherical aberration, quadratic astigmatism, and fifth-order astigmatism. The coefficients are useful in the evaluation of interferograms in optical testing. (4 refs.)

71077 Derivation of the point spread function. H.F.A.Tschunko (NASA Goddard Space Flight Center, Greenbelt, MD, USA).
Appl. Opt. (USA), vol.22, no.9, p.1413-14 (1 May 1983).
The derivation of the point spread function in general uses the mathematical theory of diffraction in detail. This derivation uses geometric relations of the incoming and diffracted wave front to establish the diffraction integral, which is equal to the Hankel integral for the Bessel function of the first kind of order one. (7 refs.)

71078 High-speed optical Fourier transformer. T.Kobayashi (Dept. of Electrical Engng., Osaka Univ., Osaka, Japan), H.Ibe, S.Fujimoto, A.Morimoto, T.D.Sueta.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.674-9 (April 1983).
A new type of high-speed signal processing or analyzing device—the picosecond Fourier transformer—is proposed. The device can be used to obtain the Fourier transform of the time-dependent intensity of an optical signal. The device makes use of the spatially distributed electrooptic modulator or deflector, and has the potential for terahertz bandwidth and picosecond time resolution. Practical devices are considered and their performance (bandwidth, frequency resolution, etc.) are discussed. The operation of the proposed device is demonstrated in the microsecond range by a preliminary experiment using $LiTaO_3$ e-o deflectors. (13 refs.)

71079 Aberration-free nonparaxial self-imaging. Y.Cohen-Sabban, D.Joyeux (Inst. d'Optique, Univ. de Paris-Sud, Orsay, France).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.707-19 (May 1983).
The fields diffracted by planar one- or two-dimensional periodic objects, and in particular their Fourier and Fresnel self-images, can be computed with the aid of a ray-tracing technique based on the Fermat principle. This method (geometrical self-imaging) yields accurate results for any numerical aperture and image field. An analytical study of the image formation, carried out in the fourth-order approximation of the phase, leads to the definition of self-imaging aberrations. These aberrations are strongly dependent on spatial frequency and render the well-known relationships derived by Rayleigh for the location and magnification of self-images approximate at best. The aberrations can be described graphically by a phase diagram and a magnification diagram, which permit interpretation of the properties of high-aperture, large-field self-images and the prediction of optimal imaging conditions. In the case of large magnifications (100× and larger) the authors present a simple method to eliminate all fourth-order aberrations completely and even sixth-order ones partially. This method consists of introducing a compensating spherical aberration to the incident wave, e.g. by the insertion of a glass plate of appropriate index and thickness just before the object. Thus object spatial frequencies up to about 900 mm^{-1} can be imaged almost without aberration for several image periods. (21 refs.)

71080 The fundamental experiments on optical information processing [with laser diode]. Y.Kajiki, K.Matsushita, E.Shimizu (Dept. of Electrical Engng., Osaka City Univ., Osaka, Japan).
Mem. Fac. Eng. Osaka City Univ. (Japan), vol.23, p.25-37 (Dec. 1982). [received: May 1983]
Describes the fundamental characteristics of the GaAlAs laser diode, for example, temporal coherence and spatial coherence, which are examined by interferometric method, optical Fourier transformation and optical correlation. (4 refs.)

71081 The development of a system theory for telecommunications, optics and cybernetics. H.Marko (Tech. Univ., Munchen, Germany).
NTG-Fachber. (Germany), vol.84, p.295-306 (1983). In German. (Neue Aspekte der Informations- und Systemtheorie (New Aspects of Information and System Theory), Garmisch-Partenkirchen, Germany, 23-25 March 1983).
Explains that a single dimensional system theory was originally developed from the operational calculus to solve linear differential equations. By reason of the superposition principle the transmission of a signal can be described in two different ways; either by a process of convolution in the time domain or

by a multiplication in the spectral domain. The author emphasizes the analogy between single and multidimensional systems to be observed generally in physics and biology. By multidimensional system theory these systems can be very simply and efficiently described. The author cites as examples the calculation of coherent optical wave fields and the derivation of a cybernetic model for the threshold of visual perception. After discussing in detail one, two, and three dimensional systems, the author concludes that functional transformation methods and Fourier transforms in particular, are a useful means for describing such systems. (9 refs.) *G.W.*

71082 An analysis of optical superresolution based on system theory. H.Platzer, H.Marko (Tech. Univ., Munchen, Germany).
NTG-Fachber. (Germany), vol.84, p.307-13 (1983). In German. (Neue Aspekte der Informations- und Systemtheorie (New Aspects of Information and System Theory), Garmisch-Partenkirchen, Germany, 23-25 March 1983).
Shows how the problem of superresolution can be dealt with by system theory. For this purpose the following topics are discussed: the transfer function of space; locally limited image signals; the classical experiment of Wolter and its computer simulation; prolate spheroidal functions and the principle of superheterodyne image formation. The ideas and the results of investigations mentioned here suggest that superresolution is not a promising process since a superresolving process must penetrate the near-zone. (8 refs.) *G.W.*

71083 Diffraction imagery of a degraded edge object in presence of image motions. A.Chandra, R.N.Singh, K.Singh (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
Opt. Appl. (Poland), vol.12, no.3-4, p.303-15 (1982).
Diffraction images of an incoherently illuminated degraded edge in the presence of image motions have been studied theoretically. The degrading effects of transverse and longitudinal sinusoidal vibrations and linear and parabolic image motions have been studied separately. The intensity distribution in the diffraction images has been calculated using the transfer function approach, and the results have been presented graphically. It is shown that consideration of the edge degradation effect is more important where the effects of various types of image motions on the performance of optical systems are to be evaluated. (32 refs.)

71084 Imaging of a two-point object in an apodized optical system. Theory and analog examination. A.Magiera, M.Pluta (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.3-4, p.363-77 (1982).
The influence of chosen types of amplitude apodizers on the two-point object imaging in one- and two-dimensional optics systems with axial symmetry has been examined. The authors propose an analog method for examining apodisation properties by simulating the convolution in a noncoherent optical processor. (7 refs.)

71085 Minimization of the second moment of the image intensity distribution. A.Magiera (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.3-4, p.474-82 (1982).
Presents an algorithm for determining a generalized pupil function minimizing the second moment of the intensity distribution in the image for a fixed value of energy transferred through the optical system with spherical aberration. (5 refs.)

42.40 HOLOGRAPHY

(for acoustic holography, see 43.63)

71086 Augmented laser scan equations for lenticular or holographic elements. L.Beiser (Leo Beiser Inc., Flushing, NY, USA).
Appl. Opt. (USA), vol.22, no.9, p.1264-5 (1 May 1983).
It is shown that augmentation exists even when the scanning element exhibits optical power independently of being over or underilluminated. While this may not develop in conventional polygon scanners, for lenticular elements are seldom actively scanned, it can become significant in holographic scanning when such optical elements are integral with the scan device. A scanning positive lenticular element is considered first in translation along the x axis and then in arced motion constrained a distance r from the fulcrum. (7 refs.)

71087 Separation of the absolute retardation fringes by using polarizing holography. Wang Ji-zhong, Zhang Wen-zhi (Shandong Engng. Inst., China).
Acta Mech. Solida Sin. (China), no.3, p.352-7 (1981). In Chinese.
With this method Nisida's pattern and the two-family absolute retardation fringes can be directly observed through a single double-exposure hologram. If a linear polarizer is placed between the hologram and the observer, while the polarizer is being rotated, the absolute retardation fringes on those points where the transmission axis of the polarizer is parallel to a principal stress can also be observed, so that the two family absolute retardation fringes can be separated accurately in the whole model. The general expression for the light intensity of the reconstructed virtual image through the polarizer is derived by using Jones vector and matrix calculus. Finally experimental results are presented. (9 refs.)

71088 Fringe benefits: applications of holographic elements. T.Mikes (American Holographic Inc., Acton, MA, USA).
Photonics Spectra (USA), vol.17, no.3, p.40-4 (March 1983).
The performance features of holographic optical elements can best be shown through the example of a simple holographic diffraction grating. Some of the major applications of interference-type holographic optical elements are listed. The wideband applications are as optical components in spectroscopy and for fiber optics. The narrowband applications, in league with lasers, include holographic notch filters, hologon scanners, beamsplitters, head-up displays and microposition encoders. (3 refs.)

71089 Real-time holography and wave-front conjugation by stimulated scattering. A.I.Sokolovskaia, G.L.Brekhovskikh, A.D.Kudriavtseva (Acad. of Sci., P.N. Lebedev Phys. Inst., Moscow, USSR).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.554-7 (May 1983).
Wave-front reconstruction (conjugation) by stimulated scattering has been shown experimentally to occur in the presence of two processes: (1) a directed scattered wave forming in the volume near the focus of a lens; (2) stimulated scattering amplification and diffraction from the amplifying amplitude hologram near the entrance window of the cell. Stimulated scattering saturation in the volume, playing the role of a dynamic hologram, lead to the breakdown of the reconstruction (conjugation) effect. The diffraction efficiency of the dynamic holograms for stimulated scattering has been measured. The influence of self-focusing on wave-front reconstruction (conjugation) by stimulated scattering is discussed. (14 refs.)

71090 Effect of convergence acceleration of a series describing the wave-front phase on the accuracy of the hologram aberration estimation. G.Mulak (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.3-4, p.341-52 (1982).
Taking as an example an axial hologram recorded and reconstructed under the condition of limit of resolution, the influence of the convergence acceleration of a series describing the wavefront phase on the convergence rate and thus on the accuracy of the aberration determination has been considered. Spherical aberration, coma and field curvature have been chosen for considerations, since they illustrate some extreme situations. It is shown that the acceleration of series convergence is associated with a change in error distribution among the constant term of the expansion, the Gaussian sphere component and the rest responsible for the aberrations. (4 refs.)

71091 Numerical method for the calculation of the light intensity distribution in the holographic image. J.Nowak, M.Zajac (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.3-4, p.353-61 (1982).
The imaging quality may be estimated through the evaluation of the aberration spot which is an imperfect image of the point object. In classical optics the aberration spot shape is calculated with the help of the 'ray tracing' method. In holographic imaging, however, it must be remembered that the light used for image reconstruction is coherent. The authors present an algorithm which enables one to calculate the light intensity distribution in the holographic image of a point object and discuss the accuracy of the results obtained. (6 refs.)

71092 Meridional light path function and coma transfer for corrected holographic concave gratings. R.Guther (Central Inst. for Optics & Spectroscopy, Acad. of Sci., Berlin-Adlershof, Germany).
Opt. Appl. (Poland), vol.12, no.3-4, p.451-60 (1982).
Calculates the general form of the light path function for corrected holographic concave gratings in the meridional cut up to the third order in the transverse grating coordinate, using both aspheric wavefronts and aspheric grating supports for a grating record. From this light path function one obtains a formula which describes the change of the third order part (comatic part) of the incident wavefront by the grating. Together with the focusing properties of the grating this gives the possibility of treating optical systems containing gratings. (7 refs.)

71093 Holographic imaging of a sinusoidal test. J.Nowak (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.3-4, p.471-3 (1982).
Examines the influence of particular aberrations on the image contrast of an object given in the form of an amplitude sinusoidal test. As is well known in a coherent system, a transfer function for both the contrast and phase cannot be defined in a way analogous to that used in incoherent optical systems. Under certain assumptions, however, it is possible to define the degradation of contrast in the image with respect to that present in the object. (3 refs.)

71094 Three dimensional images. J.Bulabois, G.Tribillon (Faculty of Sci. & Tech., Besancon, France).
Recherche (France), vol.14, no.144, p.638-46, 649 (May 1983). In French.
Three dimensional images have always been an attraction. In 1948 D. Gabor discovered the principles of holography. 20 years later, with lasers available, holographic progresses have speeded up very considerably. The paper is an appreciation of the present position. The development of photography from the very early days is described, leading up to the discovery of holography. The method in which relief is obtained, using lasers, is explained. Diagrams are given to explain the basics of holography, in a very simple manner. There is an accompanying explanation and then follows a description of progress made from fixed to moving objects. The uses of three dimensional images for medical work are explained and the use of images in natural light. Vision not apparent to the eye is outlined and there is a brief glimpse into the future. (5 refs.) *G.V.D.*

71095 Investigation of influence of polarizing radiation scattered by an optically inhomogeneous layer on its holographic image quality. V.K.Polyanskii, A.G.Ushenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.511-14 (April 1983). In Russian.
Statistical light scattering effects on restored holographic image brightness characteristics are investigated for optically inhomogeneous layers. It is shown that it is possible to control the brightness in their images. (9 refs.)

42.50 QUANTUM OPTICS

71096 Probability distribution of photocounts of the light scattered by critical fluctuations. S.H.Chen (Nuclear Engng. Dept., MIT, Cambridge, MA, USA), C.C.Lai, J.Rouch, P.Tartaglia.
J. Stat. Phys. (USA), vol.30, no.3, p.699-707 (March 1983).
The probability distribution of photocounts $P(n, T)$ of the light scattered by concentration fluctuations in a binary system near the critical point has been measured. The results turn out to be consistent with the theoretical predictions for Gaussian-Lorentzian light. (18 refs.)

71097 On coherence in spontaneous emission. F.W.Cummings, A.Dorri (Dept. of Phys., Univ. of California, Riverside, CA, USA).
Phys. Lett. A (Netherlands), vol.95A, no.5, p.263-5 (2 May 1983).
The case of a single excited two-level atom emitting spontaneously in the presence of N unexcited atoms is solved exactly for emission into a single electromagnetic mode. The two-level atoms are in inequivalent mode positions. (5 refs.)

71098 Validity of Rosen-Zener conjecture for Gaussian-modulated pulses. G.F.Thomas (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada).
Phys. Rev. A (USA), vol.27, no.5, p.2744-6 (May 1983).
Using the Magnus approximation the author shows that the Rosen-Zener conjecture holds for a two-level system in near-resonant interaction with a Gaussian-modulated pulse of sufficiently short duration. (12 refs.)

71099 Kinetic equation for a two-level system interacting with the electromagnetic field. N.N.Bogolyubov,Jr., Fam Le Kien, A.S.Shumovskii (Joint Inst. for Nuclear Res., Dubna, USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.893-8 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.423-30 (Sept. 1982). [received: May 1983]
Bogolyubov's method (1974) is used to obtain a generalized kinetic equation for a dynamical system of two-level emitters interacting with the electromagnetic field. The problem of collective spontaneous emission is investigated by means of this equation with allowance for inhomogeneous Lorentz broadening. (41 refs.)

71100 A novel numerical model for passively mode-locked solid-state lasers. A.Leitner, M.E.Lippitsch (Inst. fur Experimentalphys., Karl-Franzens-Univ. Graz, Graz, Austria), E.Roschger, F.R.Aussenegg.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.562-6 (April 1983).
Numerical computer models could be of high value in testing ideas for improving passive mode locking. Most of the known models for solid-state lasers lack realistic quantitative results, however. A new model is presented, using a rate-equation approach which has been refined to include interference effects by using field amplitudes and phases instead of energies. Also, the saturable absorber is treated by rate equations. With this model, a rather complete description of the pulse evolution is possible. The influence of various parameters on the mode-locking quality is calculated. The model is also capable of reliably describing processes based mainly on interference effects, like the action of external subresonators. (16 refs.)

71101 Saturation effects in phase-conjugate lasers. A.Hardy, Y.Silberberg (Dept. of Electronics, Weizmann Inst. of Sci., Rehovot, Israel).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.594-9 (May 1983).
Phase-conjugate lasers with saturable gain medium are analyzed, taking into account the saturation of the reflectivity of the phase-conjugate mirror that is due to pump depletion. It is shown that the behavior of the laser is determined by the extent to which the reflectivity is saturated as compared with the saturation of the gain medium. For weakly saturated phase-conjugate mirrors, the intensities and gain are not much different from those in conventional lasers. For strongly saturated mirrors, the laser behaves more like a single-pass amplifier with output intensity proportional to the pump intensity of the phase-conjugate mirror. (18 refs.)

71102 Power and stability of phase-conjugate lasers. T.J.Karr (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.600-9 (May 1983).
The phase-conjugate laser (PCL) is analyzed as a network of energy flow with gain, saturation, and loss. Most PCLs fit into one of the three generic forms of energy coupling, defined by how the phase-conjugate mirror is pumped. The self-pumped PCL is a nonlinear feedback system with constraints not present in ordinary lasers. The internal and external powers are roots of a transcendental function that includes arbitrary gain and saturation. The PCL's are compared for useful output power with an ordinary laser of the same gain/loss. Most PCLs have maximum output as double-pass amplifiers (weak feedback and high extraction). The externally pumped PCL is inherently inefficient except at high gain. The self-pumped PCLs are efficient at high and low gain and are multistable optical devices with discrete power levels. The multistability is generic and does not depend on any specific form of the reflectance function. The higher states have not been seen experimentally because they cannot develop from the lowest state but must be induced by hard excitation of the PCL. (21 refs.)

71103 On the critical length of a laser. G.Stephan (Lab. de Spectroscopie, Univ. de Rennes, Rennes, France).
J. Phys. Lett. (France), vol.44, no.10, p.L361-8 (15 May 1983). In French.
The critical length of a laser has been introduced to explain a variation in the asymmetry of the line shape when the length of the cavity is varied. The author theoretically shows that this concept is a consequence of the mean field approximation which is not justified when the amplifying medium fills the entire cavity. It then appears that this variation of asymmetry is also related to the length of the amplifying tube. An exerimental verificiation of this result is given. (7 refs.)

71104 The laser: a reversible quantum dynamical system with irreversible classical macroscopic motion. K.Hepp (Dept. of Phys., ETH, Zurich, Switzerland), E.H.Lieb.
Melting, Localization, and Chaos. Proceedings of the Ninth Midwest Solid State Theory Symposium, Argonne, IL, USA, 2-3 Nov. 1981 (New York, USA: North-Holland 1982), p.153-77
Describes a mathematical machine which behaves like a laser but which is much simpler than any laser found in the laboratory. The machine consists of two main parts: the first one, which is the laser proper, consists of atoms and photons which are the quantized proper vibrations of a resonant cavity. It is essential that the number, N, of atoms be allowed to become very large, but the number of different photon modes can be infinite or finite. This number can in fact be one in order for the machine to operate, but in real life the number of modes is infinite. One can handle the infinite mode case provided that essentially only a finite number of modes is macroscopically excited. The second part consists of reservoirs. They are dynamical systems which in some sense are infinitely large compared to N, and they are so constructed that they can both pump energy into and drain energy out of the laser. The energy flux from reservoir to laser is thoroughly chaotic. The laser can take this energy and structure it. In other words, the laser, when suitably coupled to the reservoir, will go into a cooperative oscillatory state in which all the N atoms and the photons vibrate coherently and periodically. (10 refs.)

42.55H Lasing action in other gas lasers

71107 Measured gain for XUV plasma lasers at varying pump intensities. R.H.Dixon, J.F.Seely, R.C.Elton (US Naval Res. Lab., Washington, DC, USA).
Appl. Opt. (USA), vol.22, no.9, p.1309-12 (1 May 1983).
Inverted population densities are measured in a laser-produced carbon plasma and interpreted in terms of absolute gain coefficients in the 1%/cm range for potential amplification in the XUV at 52-nm wavelength. Scaling to higher gain through increased ionization at higher pumping intensities is attempted, and a factor of 2 enhancement is indicated. (17 refs.)

71108 Improved lasing performance of KrCl excimer laser. E.Armandillo, A.Luches, V.Nassisi, M.R.Perrone (Dipartimento di Fisica, Univ. di Lecce, Lecce, Italy).
Appl. Phys. Lett. (USA), vol.42, no.10, p.860-1 (15 May 1983).
A compact, small active volume (70 cc) discharge pumped KrCl laser with UV preionization is described. The results obtained show that KrCl compares well with the performance obtainable fropm the well established XeCl and KrF lasers. Considerably improved laser output energy density ($\approx$2.5 J/1) is achieved at very high discharge power loadings ($\approx$24 MW/cc), with a good power conversion efficiency (0.8%) and a long gas static lifetime. The output laser beam is reproducible and uniform with a cross section of 2×1 cm^2. (5 refs.)

71109 Thermal homogeneity in a closed excimer laser cavity. C.J.Knight (Avco Everett Res. Lab. Inc., Everett, MA, USA).
AIAA J. (USA), vol.21, no.4, p.541-9 (April 1983).
Thermal homogeneity in a single-pulse excimer laser cavity is of interest because it directly impacts medium optical quality. This study is primarily oriented toward an XeF* laser in which the cavity is hot (500K) and is pumped by an e-beam from a cold cathode structure in a vacuum chamber next to the cavity. The foil and support structure are on a vertical wall between these hot and cold zones. In consequence, due to radiative heat transfer, the wall assumes a nonuniform temperature and induces natural convection and thermal inhomogeneity within the cavity. Studies of radiative, conductive, and natural convective heat-transfer processes are summarized which leads to a plausible engineering approach to achieving medium homogeneity of $(\delta\rho/\rho)_{rms}\sim5\times10^{-5}$ in the closed XeF* laser cavity. (7 refs.)

71110 Spectral characteristics of carbon monoxide lasers with different isotopic compositions. V.I.Masychev, V.G.Plotnichenko, V.K.Sysoev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1494-6 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2303-6 (Nov. 1982). [received: May 1983]
The spectral characteristics of sealed carbon monoxide lasers with different isotopic compositions were investigated at room temperature. The emission spectra were recorded for three identical CO lasers filled with gas mixtures containing $^{12}C^{16}O$, $^{13}C^{16}O$, and $^{12}C^{16}O$-$^{13}C^{16}O$. In the case of lasers with nonselective resonators the number of emission lines in the 1893-1610 cm^{-1} range was 28-30 (for the mixture of isotopes it was 22). The emission spectrum of the laser filled with $^{13}C^{16}O$ was shifted by 40 cm^{-1} in the direction of lower frequencies compared with the spectrum of the $^{13}C^{16}O$ laser. (10 refs.)

71111 Possibility of laser emission from excimers and exciplexes of aromatic compounds. S.A.Krashakov, B.M.Uzhinov (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1521-3 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2336-9 (Nov. 1982). [received: May 1983]
An analysis is made of the possibility of laser emission from excimers and exciplexes of aromatic compounds. The cross section for stimulated emission from excited particles is used as the main criterion. Approximate estimates indicate that the lower limit of this cross section for compounds known to exhibit laser emission is $(3\text{-}5)\times10^{-17}$ cm^2. In the case of excimers and exciplexes of aromatic compounds examined in the present paper this cross section is an order of magnitude less. It follows that lasing of typical intermolecular and intramolecular excimers and exciplexes is not very likely. (38 refs.)

71112 Gain anisotropy in low-pressure chemical lasers. H.Mirels (Aerophys. Lab., Aerospace Corp., Los Angeles, CA, USA).
Appl. Opt. (USA), vol.22, no.9, p.1281-3 (1 May 1983).
The gain coefficient in a low-pressure chemical laser during lasing differs when viewed along the optical resonator axis and when viewed normal to the axis. Expressions for axial and normal gain coefficients are deduced. The ratio of normal-to-axial gain coefficient is evaluated for a saturated multimode chemical laser employing a Fabry-Perot resonator. The results are useful for correlating numerical code calculations with experimental power on gain measurements made normal to the optical axis. (5 refs.)

71113 On the regeneration mechanism of $HgBr_2$ in $HgBr/HgBr_2$ dissociation lasers. A.C.Erlandson, T.A.Cool (School of Appl. & Engng. Phys., Cornell Univ., Ithaca, NY, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.6, p.685-9 (29 April 1983).
The fast bimolecular reaction $HgBr+Br_2 \rightarrow HgBr_2+Br$ is shown to be responsible for the observed rapid and efficient regeneration of $HgBr_2$ in cyclic operation of the repetitively pulsed HgBr photodissociation laser. The rate constant for this reaction has been measured to be $(7.7\pm0.6)\times10^{-11}$ cm^3 molecule^{-1} s^{-1} at 415K. (11 refs.)

71114 Photochemical xenon-oxide laser. V.S.Zuev, L.D.Mikheev, I.V.Pogorel'skii.
J. Sov. Laser Res. (USA), vol.4, no.1, p.1-31 (Jan.-Feb. 1983).
Theoretical and experimental investigations are described, aimed at the development, construction, and study of the features of a photochemical xenon-oxide laser whose action is based on the photodecomposition of nitrous oxide by vacuum ultraviolet radiation of an open high-current discharge with formation of oxygen atoms followed by oxidation of the xenon. The theoretical problems connected with the determination of the mechanism and the calculation of the kinetics of the physicochemical processes in an XeO laser are considered. A numerical computation of the pumping is carried out, and the inversion and gain on the laser transition are calculated. The construction of the laser is described, as well as an experimental procedure for obtaining the optimal temperatures, composition, and pressure of the working-mixture components. (49 refs.)

71115 Optical absorption spectrum of Pr^{3+} in aprotic $POCl_3$:$SnCl_4$ laser liquid. S.V.J.Lakshman, L.R.Moorthy (Dept. of Phys., S.V. Univ., Tirupati, India).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.439-44 (May 1983).
Spectral studies of Pr^{3+} in aprotic $POCl_3+SnCl_4$ laser liquid have been carried out in the visible and near IR regions. From the observed band positions, the Slater-Condon (F_2, F_4, and F_6) configuration interaction (α,β), spin-orbit (ξ_{4f}), nephelauxetic (β), bonding (δ), and Judd-Ofelt (T_2, T_4 and T_6) intensity parameters are evaluated. From the splittings of the $^3P_2$ and $^1D_2$ bands, crystal field (A_{20}, A_{40}) parameters were evaluated assuming C_{3h} symmetry for Pr^{3+} in $POCl_3$:$SnCl_4$ laser liquid. Theoretical estimates of spectral intensities calculated from Judd-Ofelt and electric (S_{ed})-magnetic (S_{md}) dipole line-strength methods are in good agreement with the observed values. Radiative lifetimes (T_R) for the electronic excited states $^3P_1$, $^3P_0$ and $^1D_2$ of Pr^{3+} in $POCl_3$:$SnCl_4$ laser liquid are predicted. (17 refs.)

71116 Laser emission from the dye mixture solution pumped by a N_2 laser. M.Terada, K.Miwa, Y.Ohba (Dept. of Instrumentation, Keio Univ., Yokohama, Japan).
Oyo Buturi (Japan), vol.51, no.11, p.1301-3 (Nov. 1982). In Japanese. [received: March 1983]
Laser emission from perylene in solution is obtained by means of energy transfer between 9-methylanthracene (donor) and perylene (acceptor). From the experimental result of the time-resolved fluorescence spectra and the Stern-Volmer relation of the dye mixture solution, the energy transfer is attributed to the dipole-dipole interaction. Laser power from the dye mixture solution is measured at various concentrations of donor and acceptor. At the optimum concentrations, the laser power from the mixture solution is about six times larger than that of the perylene solution. (7 refs.)

71117 Mechanism of four-level laser action in solution excimer and excited-state proton-transfer cases. A.U.Khan, M.Kasha (Dept. of Chem., Inst. of Molecular Biophys., Florida State Univ., Tallahassee, FL, USA).
Proc. Natl. Acad. Sci. USA, vol.80, no.6, p.1767-70 (March 1983).
Four-level laser energy level schemes are compared from the mechanistic spectroscopic viewpoint: (i) noble-gas excimer, (ii) solution molecular excimer, (iii) conventional dye laser, and (iv) intramolecular proton transfer. The lasing action of the chlorophyll special pair is discussed as an example of a solution excimer laser, and the lasing action of 3-hydroxyflavone and other molecules is discussed as an example of an intramolecular proton-transfer laser. 42.55P Lasing action in semiconductors with junctions

71118 1.5-1.6-μm $Ga_{0.47}In_{0.53}As/Al_{0.48}In_{0.52}As$ multiquantum well lasers grown by molecular beam epitaxy. H.Temkin, K.Alavi, W.R.Wagner, T.P.Pearsall, A.Y.Cho (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.42, no.10, p.845-7 (15 May 1983)., p.A135-83011
The first successful preparations of optically pumped and current injection $Ga_{0.47}In_{0.53}As/Al_{0.48}In_{0.42}As$ multiquantum well lasers is reported. These devices, operating at room temperature in the 1.5-1.6-μm range, have been prepared by molecular beam epitaxy with well thickness as low as 80-90 Å and barrier thicknesses as low as 30 Å. In the broad area devices with a total active layer thickness of 0.14 μm the authors have observed a threshold current density as low as 2.4 kA/cm^2. (11 refs.)

71119 Short cavity InGaAsP/InP lasers with dielectric mirrors. U.Koren, Z.Rav-Noy, A.Hasson, T.R.Chen, K.L.Yu, L.Chiu, S.Margalit, A.Yariv (California Inst. of Technol., Pasadena, CA, USA).
Appl. Phys. Lett. (USA), vol.42, no.10, p.848-50 (15 May 1983).
Short cavity length (38 μm) lasers have been fabricated using a recently developed microcleavage technique. SiO_2-amorphous Si multilayer coatings have been evaporated on the lasers to obtain high reflectivity mirrors. The lasers have current thresholds as low as 3.8 mA with 85% reflecting front mirror and high reflectivity near mirror and 29 mA with two high reflectivity mirrors. Single longitudinal mode operation is observed over a wide range of driving currents and temperatures. (6 refs.)

71120 New large optical cavity laser with distributed active layers. W.T.Tsang, N.A.Olsson (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.42, no.10, p.850-2 (15 May 1983).
A new semiconductor current injection laser having multiple active layers distributed within a large optical cavity (LOC) waveguide is shown to operate as an efficient, low-threshold, high-peak power laser diode. The use of distributed active layers in LOC laser structure leads to improved efficiency in utilizing the injected carriers when compared to the conventional single active layer LOC laser structure. (6 refs.)

71121 A high-power, single-mode laser with twin-ridge-substrate structure. M.Wada, K.Hamada, H.Shimizu, T.Sugino, F.Tajiri, K.Itoh, G.Kano, I.Teramoto (Semiconductor Lab., Matsushita Electronics Corp., Osaka, Japan).
Appl. Phys. Lett. (USA), vol.42, no.10, p.853-4 (15 May 1983).
The structure of stripe-geometry lasers is reported in which a double heterostructure with a very thin active layer is fabricated on a substrate with two parallel ridges. It is shown that the structure is very much fitted for the high-power, single-mode oscillation. The maximum CW output obtained is approximately 100 mW/facet, which is the highest power output ever attained in fundamental transverse model devices. The far-field beam divergence parallel and perpendicular to the junction plane are as small as 6° and 16°, respectively. (11 refs.)

71122 Bistability and slow oscillation in an external cavity semiconductor laser. W.A.Stallard, D.J.Bradley (Laser Group, Phys. Dept., Trinity Coll., Dublin, Ireland).
Appl. Phys. Lett. (USA), vol.42, no.10, p.858-9 (15 May 1983).
Reproducible bistable and hysteretical behavior is obtained from an external cavity laser, with one absorbing and one gain semiconductor diode, when the absorber diode is operated below its transparency threshold current density. The laser diodes are optically coupled without parasitic conductance or photoconductive electrical coupling and the bistable laser operates in a single longitudinal mode. Under certain conditions the laser oscillates at around 20 Hz with millisecond optical switching times. (15 refs.)

71123 Temporal and spectral characteristics of rapidly gain-switched GaAs/GaAlAs buried-heterostructure lasers. G.Veith, J.Kuhl, E.O.Gobel (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Electron. Lett. (GB), vol.19, no.10, p.385-7 (12 May 1983).
The temporal and spectral output of GaAs/GaAlAs buried-heterostructure lasers under excitation with 60 ps electrical pulses is investigated for different DC bias conditions. Optical pulses comparable in width to the electrical pulses can be obtained only if the DC bias is below or close to threshold, where multimode emission is observed. For DC bias well above threshold the laser remains single-mode; however, the optical pulses are considerably broadened. (14 refs.)

71124 Optical properties of a GaAlAs superluminescent diode. N.K.Dutta, P.P.Deimel (Bell Labs., Murray Hill, NJ, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.496-8 (April 1983).
The optical properties of a GaAlAs superluminescent diode (SLD) are described. The spectra of this device exhibit a large number of longitudinal modes. The coupling efficiency into a 0.23 NA 50 μm diameter graded index fiber is $\sim$30 percent. The current required for constant light output at a temperature T can be written as $I(T) \sim I_o.\exp\ (T/T_2)$ where $T_2 \sim 120$K. A model of the SLD is described. (12 refs.)

71125 Growth and characterization of Cd-doped InGaAsP/InP double heterostructure lasers. N.Tamari (Bell Labs., Holmdel, NJ, USA).
J. Electron. Mater. (USA), vol.11, no.4, p.611-29 (July 1982). [received: Nov. 1982]
The liquid phase epitaxial growth of Cd-doped InGaAsP/InP double heterostructure lasers (1.3 μm) has been studied. Cd has been found to have a smoothing effect on the morphology of the quaternary layers and a typical terracing effect on that of InP found also by doping with Zn. The defects, revealed by etching, were found to propagate in one to one correspondence from the substrate throughout the whole structure with no generation of defects even in a highly doped material. Electrical saturation at $p \sim 2 \times 10^{18}$ cm^{-3} was found in InP by Hall measurements while no saturation was found in the quaternary up to a hole concentration of $\sim 2 \times 10^{19}$ cm^{-3}. A lattice mismatch which is linearly dependent on the amount of Cd in the liquid was found to greatly facilitate the location of the p-n junction within the active region because of its low diffusion. Low threshold, very high external differential quantum efficiency, and high uniformity characterize the lasers made of this material. The results obtained in this work suggest that Cd should be considered as a promising candidate for a p-type dopant in fabrication of quaternary devices. (22 refs.)

71126 Stimulated emission from shallow donors localized by a strong magnetic field. H.J.A.Bluyssen (Res. Inst. for Materials, Univ. of Nijmegen, Nijmegen, Netherlands), L.J.van Ruyven.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.371-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
From measurements of the energy shift of the laser emission and the threshold current as a function of the magnetic field up to 25 T (DC) and at $T=9$K, localization of the shallow donors in the moderately doped ($\approx 10^{17}$ cm^{-3}) n-type active layer of a double heterostructure injection laser has been observed. A fit of the measured energy shift of the donor ground state as a function of the magnetic field with theoretical calculated values yields the impurity concentration in the active layer and the carrier density at threshold at $B=0$T. (5 refs.)

71127 Prethreshold optical coupling between parts of a spatially inhomogeneous injection laser. L.A.Rivlin, A.T.Semenov, A.F.Solodkov, V.P.Tabunov, S.D.Yakubovich (All-Union Sci.-Res. Inst. of Optophys. Measurements, Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1499-502 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2310-13 (Nov. 1982). [received: May 1983]
A calculation is made of the rate of optical pumping of a weak-injection region of a two-component semiconductor laser by the radiation emitted from a strong-injection region operating in the subthreshold regime. An experimental determination is reported of the relationship between the optical and electrical coupling of the two regions. A comparison is made of the threshold characteristics of inhomogeneously excited homojunction and heterojunction lasers. (8 refs.)

71128 Restoration of single-frequency emission by suppression of pulsations of the intensity of the radiation emitted by an injection laser. V.N.Morozov, A.S.Semenov, A.B.Sergeev, I.A.Skopin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1513-14 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2326-8 (Nov. 1982). [received: May 1983]
Pulsations of the radiation intensity were suppressed in an injection laser with a transverse *p-n* junction by establishing a feedback via a section of a fiber waveguide brought into contact with the laser. This resulted in emission of just one longitudinal mode from the laser diode. (10 refs.)

71129 Influences of thermal effects on high power CW outputs of *b*-axis Nd:YAP lasers. Shen Hong-yuan, Zhou Yu-ping, Yu Gui-fang, Huang Xiao-liang, Wu Cai-ming, Ni Yu-yun (Fujian Inst. of Res. on the Structure of Matter, Acad. Sinica, Fuzhou, China).
Chin. Phys. (USA), vol.3, no.1, p.45-53 (Jan.-March 1983). [received: May 1983]
Based on their previous work, the authors propose here a design of an optical resonator with an elliptical profile of refractive index. Moreover, the influences of thermal effects on the transversal field distribution, the direction of polarization, as well as the output power of *b*-axis Nd:YAP (Nd+Cr:YAP) CW lasers are analyzed. With these factors taken into account, they have been able to achieve 163-W and 152-W laser outputs with nearly linearly polarized beams from a 5.8 mm dia.×111 mm long Nd:YAP rod and a 6.4 mm dia.×100 mm long Nd+Cr:YAP rod and overall efficiencies of 2.26% and 2.11%, respectively. The depolarization and output stability of the laser beam are 1:2900 and less than 2% respectively at a 129.5-W laser output. (11 refs.)

71130 Pulsed gain and thermal lensing of Nd:LiYF$_4$. J.E.Murray (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.488-91 (April 1983).
Measurements show that a 1 cm diameter Nd:YLF rod amplifier produces extremely weak thermal lensing when pulse pumped at 3 Hz to a gain of 13 at 1053 nm. Direct comparison with Nd:YAG indicates much weaker thermal lensing effects for both ordinary and extraordinary polarizations in Nd:YLF. (12 refs.)

71131 Influence of the internal stresses in the YAG:Nd active material on the power of a pulsed laser. J.Kubelka, J.Zikmund.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.3, p.77-8 (March 1983). In Czech.
Theoretical and experimental investigations of the influence of birefringence in the YAG:Nd crystal due to internal stresses on the output power of the laser beam are described. The results indicate that crystals with a certain degree of internal stresses are acceptable for lasers operating in active modulation regime. The method described can be used for the assessment of the permissible birefringence of YAG:Nd. (2 refs.) *E.D.*

71132 Nonlinear self-consistent theory of the orotron. R.P.Leavitt, D.E.Wortman (US Army Electronics Res. & Dev. Command, Harry Diamond Labs., Adelphi, MD, USA).
J. Appl. Phys. (USA), vol.54, no.5, p.2219-22 (May 1983).
The authors describe a simple, nonlinear, self-consistent theory of the orotron (a Smith-Purcell free-electron laser) in which the relationship between output power, beam current, and beam accelerating voltage is obtained in closed form. This model explains certain features of the orotoron observed experimentally that were previously poorly understood. Quantitative predictions of the theory are in good agreement with experiment. (13 refs.)

71133 A model for superradiance and superfluorescence in free-electron lasers. R.Bonifacio, F.Casagrande (Dipartimento di Fisica, Univ. di Milano, Milano, Italy).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.2, p.39-47 (14 May 1983).
The authors consider dissipative effects in the free-electron laser (FEL). They define the concepts of superradiance and superfluorescence for the FEL and state the conditions under which a co-operative (superradiant or superfluorescent) emission of radiation should be expected. First, they present the basic equations of motion for the electron dynamics following a simple, heuristic approach. Next, a set of numerical results are discussed. Finally, they formulate a suitable master equation which allows for a treatment of co-operative effects in FEL dynamics starting at the quantum-statistical level and leads under suitable conditions to the equations of motion previously considered. (15 refs.)

42.60 LASER SYSTEMS AND LASER BEAM APPLICATIONS

71134 Operation of krypton-filled flashlamps at high repetition rates. J.Richards, D.Rees, K.Fueloep, B.A.See (Electronics Res. Lab., Dept. of Defence Support, Adelaide, Australia).
Appl. Opt. (USA), vol.22, no.9, p.1325-8 (1 May 1983).
A technique for operating krypton-filled flashlamps at high repetition rates and with high efficiency in *Q*-switched lasers is described. The technique uses high simmer currents to remove the timing and amplitude jitter that occurs at high repetition rates when krypton-filled lamps are run with conventional, low simmer currents. Besides giving excellent pulse-to-pulse reproducibility in the laser output, the method also removes any tendency for the lamp to misfire or extinguish. (7 refs.)

71135 Measurement of the modal reflectivity of an antireflection coating on a superluminescent diode. I.P.Kaminow, G.Eisenstein, L.W.Stulz (Crawford Hill Lab., Bell Labs., Holmdel, NJ, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.493-5 (April 1983).
A method for measuring the modal reflectivity of the antireflection coating applied to a laser diode is described and demonstrated. It is based on measurements of the Fabry-Perot modulation depth of the resulting superluminescent diode (SLD) output spectrum at the threshold current of the original laser. A modal reflectivity of less than 2×10^{-4} has been obtained. (8 refs.)

71136 Synchronous amplification of subpicosecond pulses. T.Sizer,II, J.D.Kafka, I.N.Duling,III, C.W.Gabel, G.A.Mourou (Lab. for Laser Energetics & Inst. of Optics, Univ. of Rochester, Rochester, NY, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.506-11 (April 1983).
In high-gain dye amplifiers, the effective storage time of the gain medium is only a few hundred picoseconds. Therefore, efficient amplification of ultrashort pulses places a stringent requirement on the synchronization between the pump pulse and the pulse to be amplified. The authors present a technique of short pulse generation using a dye laser synchronously pumped by a frequency-doubled CW mode locked Nd:YAG laser. Pulses as short as 70 fs are produced. The short optical pulses are subsequently amplified with two different synchronous amplification schemes using 100 ps pulses to establish the gain in the dye amplifier stages. Subpicosecond pulses with energies from a few hundred nanojoules at 500 Hz to a few hundred microjoules at 7 Hz can be obtained. (16 refs.)

71137 Generation of picosecond pulses in an injection laser with an external selective resonator. Yu.L.Bessonov, A.P.Bogatov, P.P.Vasil'ev, V.N.Morozov, A.B.Sergeev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1510-12 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2323-6 (Nov. 1982). [received: May 1983]
Pulses of 15 psec duration were generated by an injection laser with an external dispersive resonator operating in the active mode-locking regime. This regime was attained by subjecting the laser diode to a current of high frequency equal to the intermode interval in the external resonator. The duration of the pulses was determined by an autocorrelation method in which the second harmonic was generated in an LiIO$_3$ crystal. (10 refs.)

42.60B Design of specific laser systems

71138 Radio-frequency-excited carbon dioxide metal waveguide laser. J.G.Grossman, L.W.Casperson, O.M.Stafsudd (School of Engng. & Appl. Sci., Univ. of California, Los Angeles, CA, USA).
Appl. Opt. (USA), vol.22, no.9, p.1298-305 (1 May 1983).
A new type of waveguide laser is described in which a single-surface concave metal waveguide also doubles as the grounded electrode in a radio-frequency-excited gaseous discharge. The laser's output modes and spectrum have been studied theoretically and experimentally for CW CO_2 operation of the laser. Overall operating efficiency and mode stability are comparable with those of conventional dielectric waveguide CO_2 lasers, and advantages of the metal waveguide laser include convection cooling, intracavity mode control, and partial self-alignment. (32 refs.)

71139 The HeNe Laser: How to buy one. IV. B.Patel (Siemens Components Inc., Iselin, NJ, USA).
Photonics Spectra (USA), vol.17, no.4, p.39-43 (April 1983).
For pt.III see ibid., vol.17, no.3, p.34-8 (1983). The author concludes with some guidelines on HeNe laser selection and purchasing. Parameters generally found in most HeNe laser specifications are listed into the three categories—optical, electrical and physical. (no refs.)

71140 The HeNe laser: putting it all together. III. B.Patel (Siemens Components Inc., Iselin, NJ, USA).
Photonics Spectra (USA), vol.17, no.3, p.34-8 (March 1983).
For pt.II see ibid., vol.17, no.2, p.33-4 (1983). Covers the integration of laser tubes, power supplies, external optics and support components, and the testing of the complete system. Specifications are given for safe and accurate mounting of a HeNe laser tube. To obtain both the maximum stable output from a HeNe laser and its typically long life, it is imperative that a laser system designer have a good understanding of pertinent laser electrical characteristics. To compensate for negative resistance effects, a ballast resistor is required. Modulation of the continuous-wave (CW) output of a HeNe laser can be accomplished by acousto-optic modulators or 'Bragg cells'. Five key parameters must be tested to insure that a laser performs in accordance with its published specifications. These are: output power, beam diameter, beam position, operating voltage and break current. (no refs.)

71141 The self-injected nonmode-locked picosecond laser. C.H.Brito Cruz, F.De Martini, P.Mataloni (Quantum Optics Lab., Istituto di Fisica 'G. Marconi', Univ. di Roma, Rome, Italy).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.573-7 (April 1983).
A new type of laser which generates picosecond pulses is presented. 6 ps. ~1 GW, 3 pps, $\lambda=1.06$ μm in a single pulse are obtained with good stability. Accurate timing of the pulses can be achieved, and no external pulse selection is required. In this laser, the pulse does not develop from quantum noise, but is the result of a nonlinear frequency and time processing in the cavity of a seed pulse that is coherent from the beginning of the shortening process. The authors believe that the remarkable characteristics of pulse stability are at least partially due to these considerations in coherence. (21 refs.)

71142 High-power continuously tunable atmospheric-pressure CO_2 laser operating in the superregenerative amplification regime. A.Z.Grasyuk, S.V.Efimovskii, A.K.Zhigalkin, S.I.Fomin (P.N. Lebedev Phys. Inst., Acad. of Sci., Troitsk, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1531-3 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2348-50 (Nov. 1982). [received: May 1983]
The phenomenon of regenerative amplification was used as the basis of a high-power (~50 MW) continuously tunable atmospheric-pressure CO_2 laser with ultraviolet preionization. Lasing was observed in an optical system in which a high-pressure CO_2 laser was used as a master oscillator. When an energy of the order of 500 μJ was injected into a nonselective confocal unstable resonator of a regenerative amplifier, the continuous tuning range reached $\sim(4\text{-}5)\times10^{-2}$ cm^{-1} for each of the several lines in the *P* and *R* branches and the width of the emitted line was $\delta\nu_{las}\lesssim(4\text{-}5)\times10^{-3}$ cm^{-1}. 71143 Properties of *Q* switches with partial polarizers. K.L.Vodop'yanov, L.A.Kulevskii, A.A.Malyutin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1480-5 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2280-8 (Nov. 1982). [received: May 1983]
An analysis is made of the polarization eigenstates of laser resonators containing electrooptic and magnetooptic *Q* switches with partial polarizers. The characteristic features of the behavior of polarization states and their eigenvalues are determined. A resonator with an active element which does not cause depolarization of the radiation is considered and it is found that the *Q*-switching curve has a region with an infinite derivative with respect to the control field. The results of calculations are checked experimentally. (7 refs.)

42.60F Laser beam modulation

71144 Building a simple reliable low-cost modelocker system. G.F.Albrecht, L.Lund, D.Smith (Lab. for Laser Energetics, Univ. of Rochester, Rochester, NY, USA).
Appl. Opt. (USA), vol.22, no.9, p.1276-80 (1 May 1983).
Since the addition of a modelocker to a passive modelocked laser oscillator results in a great improvement of just about all output characteristics, the authors wish to describe how to build a modelocker system of commercial performance with resources that are within reach of most university laboratories. (27 refs.)

71145 Improving the pulse shape in dye laser amplifiers: a new technique. P.Kumar, R.S.Bondurant (MIT Res. Lab. of Electronics, Cambridge, MA, USA).
Appl. Opt. (USA), vol.22, no.9, p.1284-7 (1 May 1983).
In this paper the authors describe a new technique to improve the performance of Nd:YAG laser-pumped dye laser amplifiers. Such amplifiers exist in many laboratories worldwide and use the commercially available Nd:YAG lasers as pump sources. This techniques uses a few beam splitters and mirrors external to the Nd:YAG laser cavity. No modification to the Nd:YAG laser itself is required. Amplified pulses obtained in this way are transform-limited to within a factor of 2. (15 refs.)

71146 Pulse compression by pulse-stacking in a KrF amplifiers. M.W.Taylor, J.Goldhar (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Appl. Opt. (USA), vol.22, no.9, p.1288-92 (1 May 1983).
A laser pulse-compression technique employed to obtain intense pulses (~1 GW) from an electron-beam-pumped KrF amplifier is demonstrated. This technique consists of time-sequencing and angle-coding separate pulses through the amplifier. The system described uses four pulses for a nominal temporal compression factor of 4. The input vs. output temporal pulse shapes and saturation characteristics are demonstrated. Also discussed are the issues of parasitic oscillations, optical cross talk, saturation pulse broadening, and limitations on scaling to larger compression factors. (12 refs.)

71147 Unpolarized EO *Q*-switched laser. J.Richards (Dept. of Defence Support, Electronics Res. Lab., Adelaide, Australia).
Appl. Opt. (USA), vol.22, no.9, p.1306-8 (1 May 1983).
A novel laser design is given that uses a special polarizing device to generate unpolarized *Q*-switched laser energy with a conventional EO Pockels cell. The special polarizing device, which replaces the linear polarizer normally used in conventional *Q*-switched resonators, allows solid-state lasers to operate efficiently at high repetition rates. Other features of the design include the elimination of the beam nonuniformities that normally occur at high repetition rates, the elimination of the need to bias the Pockels cell, and the ability to produce, by a simple mirror realignment, a plane-polarized output with high efficiency. (7 refs.)

71148 Femtosecond optical pulses. R.L.Fork, C.V.Shank, R.Yen, C.A.Hirlimann (Bell Labs., Holmdel, NJ, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.500-6 (April 1983).
Reviews recent advances in generation, amplification, compression, and frequency broadening of femtosecond optical pulses. The authors describe use of colliding pulse mode locking to generate pulses of 65 fs duration and pulse compression to reduce those pulse durations to 30 fs. Amplification of femtosecond pulses to gigawatt powers and frequency broadening to obtain white light continuum pulses while retaining femtosecond pulse durations are also examined. (16 refs.)

71149 Ultrashort pulse propagation in saturable media: a simple physical model. N.J.Frigo (LASSP & Material Sci. Center, Cornell Univ., Ithaca, NY, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.511-19 (April 1983).
Presents a descriptive model of ultrashort pulse propagation in saturable amplifying and absorbing media, emphasizing a pictorial representation of the relevant parameters. The rate equation approximation is used and the earlier

results of Frantz and Nodvik (see J. Appl. Phys., vol.34, p.2346, 1963) are both generalized and placed in a more intuitive form. A formal procedure is developed for analyzing multilevel systems that are more complicated than the basic two- and four-level models. Examples involving dye mixtures, linear, ring, and colliding pulse mode-locked lasers are presented, illustrating the ease with which the model can be applied. (17 refs.)

71150 Pulse shaping in passively mode-locked ring dye lasers. M.S.Stix (Dept. of Phys. & Res. Lab. of Electronics, MIT, Cambridge, MA, USA), E.P.Ippen.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.520-5 (April 1983).
The concept of 'pulse shortening velocity' is introduced as a simplified measure of pulse width performance in passively mode-locked ring dye lasers. Pulse shapes have been computed for a variety of operating conditions. The influence of coherent coupling in colliding pulse systems is found to be essentially equivalent to that of an increased saturable absorber cross section. (12 refs.)

71151 Calculation of the colliding pulse mode locking in CW dye ring lasers. D.Kuhlke, W.Rudolph, B.Wilhelmi (Dept. of Phys., Friedrich Schiller Univ., Jena, Germany).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.526-33 (April 1983).
A calculation of the influence of a transient absorber grating on the pulse parameters of a dye laser in the 'colliding pulse mode-locking' (CPM) regime is given. It is shown that, compared to other passive methods, considerably shorter pulses with a more favorable stability region can be obtained. Within the stability range of single pulse operation the shortest pulses in the CPM are obtained by operating far above threshold where the saturation energy of the amplifier is much greater than that of the absorber. Deviation from an amplifier position that is symmetric with respect to the amplification of the counter-running pulses leads to different energies of the pulses and to a strong decrease of the stability range. Taking the dispersive properties of absorber and amplifier into consideration, equations for the time dependent phase of the laser pulse are established and solved by an analytical ansatz. The resulting pulse chirp is shown to be mainly dependent on the detuning of the pulse frequency from the center frequency of the saturable absorber. The estimated values for the pulse duration and the down-chirp for typical experimental conditions of a rhodamine 6G-DODCI CPM laser agree well with the measured ones. (10 refs.)

71152 Compression mechanism of subpicosecond pulses by malachite green dye in passively mode-locked rhodamine 6G/DODCI CW dye lasers. A.Watanabe (Dept. of Electronics, Faculty of Engng., Tottori Univ., Tottori, Japan), H.Takemura, S.Tanaka, H.Kobayashiu, M.Hara.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.533-9 (April 1983).
The pulse width compression effect of a malachite green (MG) dye upon subpicosecond pulses has been experimentally investigated in a CW passively mode-locked rhodamine 6G/DODCI dye laser. The pulse width reduces as MG concentration increases, and reaches 0.34 ps at 1.5×10^{-6} M. By adding the MG dye, good mode locking is achieved in a rather wide pumping-power range. A computer simulation of pulse growth has also been carried out by using simple rate equations, in which the fast-recovery component of loss due to the MG dye is taken into account. The simulated results can explain some experimental results qualitatively such as pulse width compression results essentially from the fast recovery of cavity loss caused by the MG dye. (18 refs.)

71153 Single and double mode-locked ring dye lasers—theory and experiment. K.K.Li (Dept. of Electrical Engng. & Computer Sci., Univ. of California, Berkeley, CA, USA), G.Arjavalingam, A.Dienes, J.R.Whinnery.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.539-44 (April 1983).
A computer model is made of the colliding-pulse ring dye laser for mode-locked production of short pulses. Initial conditions of either noise or a small CW oscillation eventually result in the same final solution. Resolution is 10 ps in the model, and a digital filter represents dispersion. A gain-sharing long pulse mode often results, but large effective absorption cross section in the mode-locking dye and optimum separation of the two dyes (one quarter of the total resonator length) favor the desired short pulse formation. The model does not include the transient grating effect. Experiments with a ring laser using rhodamine 6G and DODCI confirmed the parameters important to the two regions. Double mode locking, in which the mode-locking dye also lases, was also studied both in the model and experimentally. It is not yet clear if the advantages of colliding pulse mode locking apply to double mode locking. (12 refs.)

71154 Passive mode locking of flashlamp-pumped dye lasers in the 508-583 nm range. W.Sibbett, J.R.Taylor (Optics Section, Blackett Lab., Imperial Coll., London, England).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.558-61 (April 1983).
Measurements of the pertinent characteristics of a new saturable absorber dye (DASBTI) are presented, together with results which demonstrate its usefulness in the passive mode locking of several flash-lamp-pumped dye lasers operating within the 508-583 nm wavelength region. (17 refs.)

71155 Spectral development of Picosecond pulses of mode-locked Nd-glass lasers. A.Penzkofer, N.Weinhardt (Naturwissenschaftliche Fakultat II-Phys., Univ. Regensburg, Regensburg, Germany).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.567-73 (April 1983).
The spectra of single picosecond pulses of mode-locked Nd-glass lasers are investigated along the pulse train. In addition to self-phase modulation, the spectra are modified due to spectral hole burning in the inhomogeneous gain profile of the active medium. (48 refs.)

71156 Characterization of pulsed Nd:YAG active/passive mode-locked laser. H.P.Kortz (Quantel Internat. Inc., Santa Clara, CA, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.578-84 (April 1983).
The influence of the distance of an active modulator to one of the resonator's end mirrors is investigated both theoretically and experimentally and is found not to be critical for high-gain lasers. The effect of the active modulator on the pulse length of an active/passive mode-locked Nd:YAG laser is discussed qualitatively. Threshold, stability, pulse length, and output energy are investigated experimentally with respect to their dependence on modulation power of the active modulator, dye concentration of the passive modulator and resonator length mismatch. At a repetition rate of 10 Hz the best achievable stability for the pulse-train energy was ±1 percent with a single pulse length of 25 ps. The resonator length has to be maintained with an accuracy of ±100 μm. (13 refs.)

71157 Single-frequency monopulse neodymium phosphate glass laser with active Q-modulation. V.M.Leont'ev, S.F.Sitnikov, V.I.Sokolov (Inst. of Atomic Energy, Moscow, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1000-4 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.199-202 (July-Aug. 1982). [received: May 1983]
Describes a single-frequency monopulse neodymium phosphate glass master oscillator whose operation is based on the principle of self-capture of radiation of a single-frequency free generation beam. The radiation energy is 20 mJ, the radiation spectrum width is 0.8×10^{-3} cm^{-1}, the pulse duration at the half-level is 40 nsec, and the instability of the generation wavelength is <1 Å. The probability of reproducibility of the single-frequency radiation is ≥0.98, and the divergence of the radiation is 1.2×10^{-3}. It is possible to obtain a series of identical single-frequency pulses near 1 pumping pulse. The generator is connected to a laser system having a single-frequency radiation output energy of ~120 J. 71158 Measuring focused Gaussian beam spot sizes: a practical method. Y.C.Kiang, R.W.Lang (Internat. Business Machines Corp., Poughkeepsie, NY, USA).
Appl. Opt. (USA), vol.22, no.9, p.1296-7 (1 May 1983).
The rapidly growing use of the laser in experimental work has created a need for accurately recording the laser power density for comparison and duplication purposes. This paper presents a straightforward procedure for measuring the focused Gaussian beam diameter. (6 refs.)

71159 An optical discharge in a condensed medium. N.E.Kask, L.S.Kornienko (Nuclear Phys. Res. Inst., Lomonosov Univ., Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.6, p.1-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.6, p.1010-17 (1982). [received: April 1983] (Proceedings of the Fifth All-Union Conference on Nonresonant Interaction of Optical Radiation with Matter, Leningrad, USSR, 1-4 Dec. 1981).
The stationary state of propagation of an optical discharge within the bulk of a condensed medium has been realized with a laser beam acting on optical glass. New information has been obtained on the largely unexamined stage of optical breakdown in glass: from the instant of initiation of thermal instability to the occurrence of damaging stresses. Measurements have been made on the parameters of the dense nonideal breakdown plasma, and studies have been made on the scope for using an optical discharge as a method of examining the state of the material with a specific volume several times greater than the specific volume of the condensed medium. (10 refs.)

71160 Thermophysical processes in the interaction of laser radiation with absorbing media. N.N.Rykalin, A.A.Uglov (Baikov Inst. of Metall., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.6, p.8-14 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.6, p.1018-25 (1982). [received: April 1983] (Proceedings of the Fifth All-Union Conference on Nonresonant Interaction of Optical Radiation with Matter, Leningrad, USSR, 1-4 Dec. 1981).
Calculations are presented on nonstationary nonlinear three-dimensional heating of metals by a laser beam, and also the nonstationary ablation of a plate produced by surface heat sources. The oscillations occurring when a laser beam acts on a material are examined and experimental data are presented on effects in gases at elevated pressures. Results are presented on the thermal and gas-dynamic processes in a high-pressure laser plasma. Experimental data are given on the synthesis of various materials and on the reduction of refractory metals in a laser plasma. (28 refs.)

71161 Statistical trends in laser damage. Yu.K.Danilenko (Lebedev Phys. Inst., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.6, p.95-101 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.6, p.1119-26 (1982). [received: April 1983] (Proceedings of the Fifth All-Union Conference on Nonresonant Interaction of Optical Radiation with Matter, Leningrad, USSR, 1-4 Dec. 1981).
The various effects in laser damage due to defects in the optical material are considered from a unified viewpoint, which covers the size dependence of the damage threshold, the statistics of the laser strength fluctuations, and the actual geometry of the focusing. Various methods are discussed for examining the set of microdefects responsible for damage. Some experiments demonstrate the effects of these in laser damage. (14 refs.)

71162 Optically pumped FIR lasers phase-locked by Stark effect applied to precise optical frequency measurements. B.Dahmani, A.Clairon (Lab. Primaire du Temps et des Frequences, Paris, France).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.150-4 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
A far infrared (FIR) optically pumped laser including an hybrid waveguide for Stark effect has been constructed. Frequency variations of the 4.5 THz (70 μm) line of CH_3OH versus applied electric voltage has been observed and explained using gain anisotropy. This laser has been phase-locked on a saturated fluorescence-stabilized $^{13}CO_2$ laser at 29.77 THz to allow the realization of new precise optical frequency measurements. (21 refs.)

71163 Simultaneous determination of the spectral and temporal properties of tunable, single, picosecond pulses from a short cavity dye laser. G.W.Scott (Dept. of Chem., Univ. of California, Riverside, CA, USA), J.H.Clark, M.A.Tolbert, S.P.Webb, A.J.Cox, G.Renz.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.544-50 (April 1983).
The authors report simultaneous quantitative spectral and temporal measurements of the output pulses from a single-axial mode rhodamine 6G short cavity (1-8 μm) dye laser. The dye laser was pumped at 10 Hz with single second harmonic (532 nm) pulses from a mode-locked Nd^{+3}:YAG laser. Spectral measurements made with a high resolution spectrograph and temporal measurements made with an ultrafast streak camera indicate the production of Fourier transform limited pulses for near threshold operation. Output pulses of 7-14 ps (FWHM) are observed from the short cavity dye laser when pumped with 15-30 ps duration 532 nm pulses. The output pulse delay and jitter are also investigated. A theoretical model for the temporal evolution of the pulses is presented and compared with the experimental results. (16 refs.)

71164 Pulse shortening in dye laser side-pumped by TEA N_2 laser. H.Uchiki, M.Yoshizawa, T.Kobayashi (Dept. of Phys., Faculty of Sci., Univ. of Tokyo, Tokyo, Japan).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.551-7 (April 1983).
The temporal behavior of the output from a homemade TEA-N_2-laser (750 ps pulsewidth) pumped dye (R6G) laser was observed with the aid of a streak camera. The observed output pulsewidths are between 60 and 160 ps depending on the configuration of the dye laser cavity. The shortest (60 ps) pulse is

obtained when the distances between output mirror and dye cell, and dye cell and grating, are 10 and 105 mm, respectively. The mechanism of the short pulse generation is clarified by comparing experimental results with the results obtained by solving rate equations numerically, where the position dependences of excited-state population and photon flux were taken into account. (18 refs.)

71165 Voltage pulse generation using CO_2 laser irradiated solid target plasmas. G.Cook, P.E.Dyer (Dept. of Appl. Phys., Univ. of Hull, Hull, England).
J. Phys. D (GB), vol.16, no.5, p.889-96 (14 May 1983).
Voltage pulses generated as a result of electron emission from a CO_2 laser-produced solid target plasma have been studied and analysed with the aim of evaluating the suitability of the plasma cell as a pulse-shape detector. The optimum output voltage is found to be relatively insensitive to target chamber geometry and maximises with a background gas pressure of $\sim 10^{-2}$ kPa, independent of gas species or target material. Voltage-current characteristics for a Cu plasma suggest that the plasma cell behaves as a thermionic generator and a model has been developed which gives a reasonable account of the experimental results. Whilst high voltages (>100 V into 50 Ω) can be produced using a modest TEA CO_2 laser, the nonlinearity of response limits the usefulness of the plasma cell as a pulse-shape detector. (12 refs.)

71166 Heterodyne analysis of laser modes. K.M.Abramski, E.F.Plinski (Inst. of Telecommunication & Acoustic, Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.3-4, p.329-40 (1982).
Describes a method using beating laser beams for the analysis of a spectral mode laser exhibiting a high resolving power. The analysis parameters, i.e., spectral resolving power and tuning rate were optimized. Experimental examples of the procedure of heterodyne analysis of He-Ne 3.39 μm and CO_2 lasers are also presented. (4 refs.)

71167 Passive mode locking in iodine photodissociation laser. I.M.Belousova, A.S.Grenishin, V.M.Kiselev, M.A.Kudinova, Yu.L.Slominskii, A.I.Tolmachev (Inst. of Organic Chem., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1502-4 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2313-16 (Nov. 1982). [received: May 1983]
An investigation was made of a group of dyes suitable for the use in passive mode locking in a laser resonator with an operating wavelength in the range 1.1-1.4 μ. An iodine dissociation laser was used by way of illustration to demonstrate experimentally the generation of pulses of 0.3 nsec duration. (11 refs.)

71168 Changes in the polarization structure of laser radiation by lens systems. P.I.Lamekin, K.G.Predko (Inst. of Phys., Acad. of Sci., Mogilev, Belorussian SSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1516-18 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2330-3 (Nov. 1982). [received: May 1983]
An investigation is made of changes in the inclination of the plane of oscillation and of the degree of linearity of the polarization in the course of propagation of laser radiation through lens systems. It is shown that after passage through an analyzer the intensity distribution in a beam that has crossed such a lens system becomes inhomogeneous. (5 refs.)

71169 Power characteristics of an He-Ne laser utilizing the $3s_2$-$2p_6$ transition in neon ($\lambda=612$ nm) and containing a $^{127}I_2$ absorption cell. M.V.Danileiko, A.M.Tselinko, L.P.Yatsenko (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1529-30 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2346-7 (Nov. 1982). [received: May 1983]
An experimental investigation was made of the power characteristics of an He-Ne/I_2 laser utilizing the $3s_2$-$2p_6$ transition in neon ($\lambda=612$ nm). The parameters of the active medium corresponding to the maximum output power were determined and high-contrast resonances of saturated absorption were recorded. (9 refs.)

42.60K Optical problems related to applications of laser beams

71170 Electronic control of the difference frequency between two semiconductor lasers. R.Steele (Dept. of Electronic & Electrical Engng., Univ. of Glasgow, Glasgow, Scotland), S.Wright.
Ann. Telecommun. (France), vol.38, no.1-2, p.53-7 (Jan.-Feb. 1983).
A method for controlling the difference frequency between two semiconductor lasers has been developed. The beat frequency is directly measured and current feedback applied to one laser to control this frequency. Stability to plus or minus 10 MHz was achieved. Applications include coherent optical communication systems. (6 refs.)

71171 Reflective optics system for multiple beam laser fusion. D.G.Burkhard, G.L.Strobel (Dept. of Phys. & Astron., Univ. of Georgia, Athens, GA, USA).
Appl. Opt. (USA), vol.22, no.9, p.1313-17 (1 May 1983).
A reflective optics system is described that will uniformly heat or transfer momentum to a spherical target. Six laser beams of three split beams are incident along three mutually perpendicular axes. The beams are reflected from cones with a 45° half-angle onto an aspheric reflector wings shaped to impart uniform heat or momentum to the target. A sample calculation shows that, for a target sphere with 1.5 index of refraction, 93% of the energy incident on the target is transmitted into the target. For smaller indices, a greater fraction of the incident energy is imparted to the target. The design provides completely uniform transmitted light as well as nearly orthogonal distribution of light over the target and is relatively insensitive to alignment errors. (5 refs.)

42.65 NONLINEAR OPTICS

71172 Spectral dependence of reversible optically induced transitions in organometallic compounds. R.C.Benson, R.C.Hoffman, R.S.Potember, E.Bourkoff, T.O.Pehler (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).
Appl. Phys. Lett. (USA), vol.42, no.10, p.855-7 (15 May 1983).
Optical switching in the class of semiconducting organometallic films such as copper and silver tetracyanoquinodimethane (CuTCNQ and AgTCNQ) can be erased using CO_2 laser radiation. Results on the wavelength and irradiance dependence of the optical switching threshold are also presented and interpreted in light of proposed switching mechanisms in these organic materials. (11 refs.)

71173 An analysis on characteristic of the hybrid optical bistability. Li Yung-gui, Zhang Hong-jun (Inst. of Phys., Acad. Sinica, Beijing, China).
Acta Phys. Sin. (China), vol.32, no.3, p.301-8 (March 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The characteristic of optical bistability is analysed theoretically for the photoelectric modulator with a feedback circuit. The effect of the 'critical slowing down' for a step input as it operates in the bistable mode is discussed. (11 refs.)

71174 Polarization instability in a light wave in a highly nonlinear medium. S.A.Akhmanov, N.I.Zheludev, Yu.P.Svirko (Moscow State Univ., Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.6, p.53-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.6, p.1070-4 (1982). [received: April 1983] (Proceedings of the Fifth All-Union Conference on Nonresonant Interaction of Optical Radiation with Matter, Leningrad, USSR, 1-4 Dec. 1981).
New nonlinear optical properties in a medium are discussed for conditions where the nonlinear correction to the electrical induction is not small by comparison with the linear part. It is shown theoretically that one can then get polarization hysteresis, which constitutes a generalization to strong fields of the effects of nonlinear rotation of the polarization ellipse and nonlinear optical activity. (7 refs.)

71175 Reduction of angular momentum coupling trees and the polarization dependence of nonlinear optical processes. R.A.Minard, G.E.Stedman, A.G.McLellan (Dept. of Phys., Univ. of Canterbury, Christchurch, New Zealand).
J. Chem. Phys. (USA), vol.78, no.8, p.5016-23 (15 April 1983).
Diagrams representing angular momentum coupling trees with vector ($j=1$) external labels in a Cartesian basis and with even degree (up to 8) are expressed as sums of products of Kronecker delta functions. Integrity basis theory is used to verify the possibility of such a representation, and to determine the number of independent invariants. The results are of use in the analysis of irreducible Cartesian tensors and thus, e.g. in nonlinear optics. As examples, the polarization dependences of the hyper-Raman and three-photon Raman effects are discussed. (24 refs.)

71176 Novel class of nonlinear surface waves: asymmetric modes in a symmetric layered structure. N.N.Akhmediev.
Sov. Phys.-JETP (USA), vol.56, no.2, p.299-303 (Aug. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.2, p.545-53 (Aug. 1982). [received: May 1983]
Wave propagation is considered in a symmetric layered structure consisting of a layer having a linear dielectric constant between two layers of a medium whose dielectric constant depends quadratically on the amplitude of the wave electric field. It is shown that besides symmetric and antisymmetric modes there can exist in the structure asymmetric modes at energy fluxes exceeding a certain minimum value. Plots of the energy flux vs. the propagation constant are obtained for each of the modes considered. It is shown that asymmetric-modes branch out in these plots from the symmetric and antisymmetric modes upon increase of the energy flux in the wave. The plots themselves are *N*-shaped in a certain range of layer thicknesses; this may lead to bistable states of the surface waves if the energy flux in the wave is the external parameter. (5 refs.)

71177 Optical transistors and bistable devices utilizing nonlinear transmission of light in systems with unidirectional coupled waves. A.A.Maier (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1490-4 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2296-302 (Nov. 1982). [received: May 1983]
An analysis is made of nonlinear transmission (self-switching, self-modulation) of light in tunnel-coupled cubically nonlinear waveguides and other optical systems carrying unidirectional waves with a distributed coupling which become separated at the exist from a system if at least one of the waves travels in a medium with a cubic (Kerr) susceptibility. Optical transistors and bistable devices based on these systems are considered. The threshold energy of bistable devices based on coupled GaAs waveguides is $\sim 10^{-10}-10^{-9}$ J. (12 refs.)

42.65B General theory

71178 Hamiltonian and recursion operator for the reduced Maxwell-Bloch equations. R.N.Aiyer (Laser Section, Bhabha Atomic Res. Centre, Bombay, India).
J. Phys. A (GB), vol.16, no.8, p.1809-11 (1 June 1983).
The Hamiltonian of the reduced Maxwell-Bloch equations (RMBE), an integrable nonlinear evolution equation, is derived. The recursion operator, its inverse and also the hierarchy of higher-order RMBE are obtained. (4 refs.)

42.65C Stimulated Raman, Brillouin and Rayleigh scattering; parametric oscillations and harmonic generation

71179 On the nature of the frequency-angular structure of stimulated Raman scattering in liquids. M.E.Kornienko, V.I.Malii, G.V.Ponezha, O.O.Ponezha.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.4, p.64-6 (1983). In Ukrainian.
Anti-Stokes Raman polariton scattering of light in liquids induced by stimulated Raman scattering is found. This phenomenon explains anomalies in spectral and angular characteristics of stimulated Raman scattering and permits studying relaxation of oscillation excitations. Results of a theoretical calculation agree with the experimental data. (3 refs.)

71180 Threshold technique for measuring parametric upconversion efficiency. F.L.Schow (Sandia Labs., Albuquerque, NM, USA), A.Riazi, O.P.Gandhi, R.W.Grow.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.491-2 (April 1983).
An experimental procedure which involves measurement of threshold values of infrared and upconverted powers for evaluating the quantum efficiency of a parametric upconverter is described. The threshold method is employed to determine the efficiency of a dye laser proustite upconversion system. (5 refs.)

71181 Numerical study of phase conjugation in stimulated Brillouin scattering from an optical waveguide. R.H.Lehmberg (Naval Res Lab., Washington, DC, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.558-66 (May 1983).
Phase conjugation in stimulated Brillouin scattering (SBS) from an optical waveguide is studied numerically, using a Cartesian two-dimensional propagation code (BOUNCE) that includes pump depletion. The simulations show that light scattered back through a phase aberrator produces a far-field profile closely matching that of the incident beam; however, the near-field intensity exhibits large and rapid spatial inhomogeneities across the entire aberrator, even for conjugation fidelities H as high as 98%. This effect can be only partially removed by spatial-filtering techniques. The dependence of H on SBS gain, scattering length L, and the average intensity $\bar{I}$ and angular divergence θ_D of the pump beam is first studied in the low-reflectivity regime (i.e. ignoring pump depletion). For amplitude gains $\gtrsim e^{10}$, H decreases monotonically with the factor $\bar{I}/\theta_D$ that is due to a small-scale intensity pulling effect. This result appears to be independent of whether θ_D arises entirely from the aberrator or from a combination of the aberrator plus curvature introduced by a lens. In all cases, pump depletion is found to enhance the fidelity by inhibiting the small-scale pulling effect. Under appropriate conditions, this can actually reverse the intensity dependence of H seen in the absence of pump depletion. (26 refs.)

71182 Enhanced four-wave mixing from silver particles. D.S.Chemla, J.P.Heritage, P.F.Liao, E.D.Isaacs (Bell Labs., Holmdel, NJ, USA).
Phys. Rev. B (USA), vol.27, no.8, p.4553-8 (15 April 1983).
Four-wave mixing from a regular array of uniformly shaped and sized silver particles has been observed. The measured conversion efficiency yields an enhancement in the particles' third-order polarizability by a factor of 900 over that of the bulk metal, and is found to be in satisfactory agreement with the enhancement of the spontaneous Raman scattering from molecules adsorbed on the same samples. (13 refs.)

71183 Second harmonic generation in centro-symmetric semiconductors. D.Guidotti, T.A.Driscoll, H.J.Gerritsen (Phys. Dept., Brown Univ., Providence, RI, USA).
Solid State Commun. (USA), vol.46, no.4, p.337-40 (April 1983).
Second harmonic generation is observed in Si and Ge at electron-hole plasma densities of 10^{21}-10^{22} cm^{-3} and found to depend strongly on crystal orientation. The authors suggest that a lower crystal symmetry within the absorption volume is consistent with a model in which depletion of covalent bond charge and subsequent lattice softening, is brought about by laser excitation of a high density of electrons into antibonding states. (12 refs.)

71184 Theory of generation and amplification of Stokes and anti-Stokes waves in gaseous media. N.E.Kornienko, A.M.Steba, V.L.Strizhevskii (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1475-9 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2271-80 (Nov. 1982). [received: May 1983]
A theoretical analysis is made of generation and amplification of Stokes and anti-Stokes waves in gaseous media allowing for Raman and parametric processes and saturation effects. Allowance is also made for any difference between the Raman polarizabilities of the Stokes and anti-Stokes waves which may be caused in particular by the occurrence of one-photon quasiresonances of the interacting waves. Assuming that pump and Stokes (or anti-Stokes) waves are applied at the entrance to a medium (inverted or uninverted), a general solution is found for the amplitudes of the interacting waves under exact resonance and phase-matching conditions. This is used as the basis to investigate their spatial evolution (in particular, for inverse Raman light scattering) and expressions are found for the maximum efficiencies for conversion of the pump to Stokes and/or anti-Stokes waves. It is shown that depending on the relationship between the Raman polarizabilities and also on the input parameters of the waves, conditions of parametric bleaching of the medium with nonzero amplitudes of all the waves or conditions of complete conversion of the pump to the Stokes and anti-Stokes waves or to one of these are established asymptotically. An investigation is made of the stability of these solutions. (12 refs.)

71185 Excitation of stimulated Raman scattering in graded-index fiber waveguides by an arbitrary Gaussian beam. V.S.Butylkin, M.F.Shalyaev (Inst. of Radio Engng. & Electronics. Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1505-7 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2316-20 (Nov. 1982). [received: May 1983]
A theoretical investigation is made of stimulated Raman scattering in graded-index fiber waveguides with a parabolic distribution of the refractive index in the transverse direction. It is assumed that a fiber is pumped by a Gaussian light beam of arbitrary width and with arbitrary focusing at the entry to the fiber waveguide. The process of stimulated Raman scattering is described by expanding the interacting waves in terms of the waveguide quasimodes which are in the form of Gauss-Hermite functions of width variable along the waveguide. Equations for the amplitudes of these functions make it possible to allow for the parametric coupling between the Stokes modes. The conditions are found for the generation of multimode and single-mode Stokes components. It is shown that the efficiency of stimulated Raman scattering is independent of the focusing of a pump beam at the entry of a fiber waveguide and that it increases on increase in the refractive index gradient. (11 refs.)

71186 Initiation of laser chemical reactions by automatic phase locking in stimulated Raman scattering in a molecular gas. G.A.Abakumov, S.P.Shaitanov (L.Ya. Karpov Physicochem. Sci.-Res. Inst., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1507-9 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2320-3 (Nov. 1982). [received: May 1983]
An analysis is made of the possibility of using stimulated Raman scattering in a biharmonic visible or ultraviolet field for the excitation of one of two coupled anharmonic molecular modes whose sum frequency is close to the difference frequency of the biharmonic field. The coupling between the modes and the fields is due to electrooptic anharmonicity in relation to the polarizability and a resonance is maintained by automatic phase locking. It is shown that such excitation of anharmonic modes may occur at power densities of the field harmonics ~10 MW/cm^2 or less. A system of equations of motion is derived for the process under discussion. (9 refs.)

71187 Generation of tunable picosecond pulses in the ultraviolet and blue-green parts of the spectrum with the aid of a distributed-feedback dye laser. A.N.Rubinov, I.Chesnulyavichus, T.Sh.Efendiev (Inst. of Phys., Acad. of Sci., Minsk, Belorussian SSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1533-5 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2351-2 (Nov. 1982). [received: May 1983]
An experimental investigation was made of the conversion of the radiation of a distributed-feedback dye laser to the ultraviolet and blue-green parts of the spectrum by the methods of frequency doubling and mixing, resulting in generation of picosecond pulses. The shortest wavelength emitted so far from distributed-feedback dye lasers was 272 nm. (6 refs.)

71188 Polarization rotation of degenerate four-wave mixing in an external magnetic field. Fu Pan-ming, Mi Xin (Inst. of Phys., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.1, p.14-20 (Jan.-March 1983). [received: May 1983]
The authors have discussed the polarization rotation of degenerate four-wave mixing in an external magnetic field. The third-order nonlinear susceptibility $\chi_{yxxx}{}^{(3)}$ is calculated in the $J_g=0\rightarrow J_e=1$ transition. It consists of two components. The first component is due to the saturation effect of the population difference. The second component is due to the Zeeman coherence induced in the interaction between atom and field. (6 refs.)

71189 Theory of degenerate four-wave mixing in picosecond excitation-probe experiments. B.S.Wherrett (Dept. of Phys., Heriot-Watt Univ., Edinburgh, Scotland), A.L.Smirl, T.F.Boggess.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.680-9 (April 1983).
A comparative theoretical study of the transient grating coherent effects in resonant picosecond excitation-probe experiments is presented. Signals in both the probe and conjugate directions are discussed. The effects of recombination, nonradiative scattering, and spatial and orientational diffusion are included. The analysis is applied to both a molecular and a semiconductor model. Signal contributions from concentration and orientational gratings are distinguished and their temporal natures discussed. From the solid-state point of view it is shown that state-filling and, in particular, anisotropic state-filling, can be identified from the configuration and time dependence of the detected signal, and thereby establish a theoretical explanation for recent observations in germanium. (29 refs.)

71190 Scattering theory of distortion correction by phase conjugation. G.S.Agarwal (Joint Inst. for Lab. Astrophys., Univ. of Colorado & NBS, Boulder, CO, USA), A.T.Friberg, E.Wolf.
J. Opt. Soc. Am. (USA), vol.73, no.5, p.529-38 (May 1983).
The correction of wave distortions by the technique of optical phase conjugation is examined first on the basis of a newly derived integral equation for scattering of monochromatic scalar waves in the presence of a phase-conjugate mirror. The solution is developed in an iterative series, and the first- and second-order terms are analyzed and illustrated diagrammatically. A generalization of the integral equation is then presented, which takes into account the electromagnetic nature of light. It is also shown that, if the conjugate wave is generated without losses or gains and with a complete reversal of polarization, a total elimination of distortions may be achieved by this technique under circumstances that frequently occur in practice. (20 refs.)

71191 Transient behavior of Kerr-like phase conjugators: the inverse problem. B.R.Suydam (Los Alamos Nat. Lab., Los Alamos, MN, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.539-47 (May 1983).
In earlier work, the transient response of a four-wave optical phase conjugator was studied. Here the author studies the inverse problem namely: how must one tailor the input pulse in order to obtain a prescribed conjugator output? The author finds that an arbitrarily short output pulse can be obtained and shows how the input, or probe, must be programmed in order to achieve this result. (18 refs.)

71192 Theory of a self-pumped phase conjugator with two coupled interaction regions. K.R.MacDonald, J.Feinberg (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.548-53 (May 1983).
The authors present a plane-wave analysis of a recently demonstrated self-pumped phase conjugator. This device uses four-wave mixing to produce the

phase-conjugate replica of an incident optical wave. All the waves are derived from the single incident wave: there are no externally supplied pumping beams. The authors consider the cases of four-wave mixing in two interaction regions coupled by simple reflection. The authors calculate the phase-conjugate reflectivity as a function of coupling strength taking into account imperfect coupling between the two interaction regions, and show that there is a threshold coupling strength below which the reflectivity is zero and above which the reflectivity is multiple valued. The authors also compute the coupling strength per unit length for a photorefractive crystal of barium titanate. (17 refs.)

71193 Modes of phase-conjugate resonators with bounded mirrors. P.A.Belanger, C.Pare, M.Piche (Dept. de Phys., Univ. Laval, Laval, Quebec, Canada).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.567-71 (May 1983).
The diffraction losses of phase-conjugate resonators with bounded mirrors are shown to depend only on two dimensionless parameters. The hemispherical phase-conjugate resonator is shown to yield a fundamental mode with minimum loss among all phase-conjugate resonators with the same mirror dimensions. Proof is given that the diffraction losses around the phase-conjugate mirror are larger than the diffraction loses around the conventional mirror; hence diffraction coupling is more efficient around the phase-conjugate mirror. Numerical results support these conclusions. (9 refs.)

71194 Three-dimensional phase-conjugate-resonator performance. G.C.Valley (Hughes Res. Labs., Malibu, CA, USA), D.Fink.
J. Opt. Soc. Am. (USA), vol.73, no.5, p.572-5 (May 1983).
The Fox-Li iterative method [Bell Syst. Tech. J., vol.40, p.253, 1961] is used to find solutions for a three-dimensional phase-conjugate resonator with a saturation gain, a random aberrator, and a pinhole spatial filter. The performance of such a resonator is excellent for resonator Fresnel numbers as small as 5 and for phase-error standard deviations as large as 2π. The use of a spatial filter to control the transverse mode shape is demonstrated. (20 refs.)

71195 Generalized mode theory of conventional and phase-conjugate resonators. M.Nazarathy (Dept. of Electrical Engng., Stanford Univ., Stanford, CA, USA), A.Hardy, J.Shamir.
J. Opt. Soc. Am. (USA), vol.73, no.5, p.576-86 (May 1983).
The phase-conjugation operator is investigated in the context of the canonical operator theory of first-order optics which was introduced in a previous series of articles. The matrix representation of this operator and its action on the generalized modes are derived, elucidating the relation between forward and reversed propagation in this new context. The resulting formalism makes possible the derivation of the eigenmodes of conventional and phase-conjugated resonators with loss or gain. Various resonator properties—confinement, stability, mode biorthogonality, and real or complex character of the spot-size parameter—simply follow from the guiding-ray-label representation. (32 refs.)

71196 Nonideal phase-conjugate resonators—a canonical operator analysis. M.Nazarathy (Dept. of Electrical Engng., Stanford Univ., Stanford, CA, USA), J.Shamir, A.Hardy.
J. Opt. Soc. Am. (USA), vol.73, no.5, p.587-93 (May 1983).
An unfolded equivalent model is constructed for the round-trip transfer operator of a phase-conjugate mirror (PCM) resonator with a cavity described by complex ABCD ray matrix elements, taking into account hard-edge mirror apertures and the possible frequency shift of the wave reflected by the PCM. The treatment makes use of recently developed canonical operator techniques and extends these methods further to incorporate wavelength variation and the effect of apertures. (22 refs.)

71197 Phase conjugation of a bulk wave by surface plasmons. K.Ujihara (Inst. for Modern Optics, Univ. of New Mexico, Albuquerque, NM, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.610-16 (May 1983).
Phase conjugation of a plane-polarized bulk wave by surface plasmons on a metal surface coated with an isotropic and transparent nonlinear dielectric is considered. The expressions for the *s*- and *p*-polarized phase-conjugate waves are given for arbitrary angle of incidence and arbitrary polarization direction of the probe wave and an arbitrary direction of propagation of two counterpropagating pump waves of surface plasmons. The reaction of the phase-conjugate wave on the probe wave is not taken into account. A reflectivity of the order of 10^{-4} is expected for a vacuum-CS_2-Ag system at ruby-laser frequency. (18 refs.)

71198 Thermally induced phase-conjugation efficiency and beam-quality studies. M.H.Garrett, H.J.Hoffman (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.617-23 (May 1983).
Aspects of thermally induced nonlinearities in the index of refraction are investigated for the case of degenerate four-wave mixing (DFWM). An expression for the reflectivity is derived within the framework of a coupled thermodynamic-electromagnetic theory, and some implications for the conjugation efficiency are briefly discussed. The authors also report on experimental measurements of phase-conjugate reflectivites in excess of 200% at 532 nm and comment on the role of saturation effects and pump delays in obtaining the observed efficiencies. Finally, the results of near-field conjugation beam-quality studies are presented with a view toward examining some of the parameters crucial to conjugation fidelity in typical DFWM experimental setups. (17 refs.)

71199 Degenerate four-wave mixing in *p*-type germanium: an absorbing medium. D.E.Watkins, C.R.Phipps,Jr. (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.624-8 (May 1983).
The authors present the results of degenerate four-wave mixing (DFWM) studies in three samples of *p*-type Ge with a wide range of absorptive properties. Three mechanisms for DFWM are observed in this material. A model, which includes the mechanisms of the inhomogeneously broadened saturable absorption of *p*-type Ge and the optical Kerr effect that is due to bound electrons in Ge but not the mechanism of bulk plasma formation that occurs only at extremely high pump intensities is developed and compared with the experimental results. Pump-beam attenuation by the medium is shown to be an important effect in modeling DFWM. The model, which has no free parameters, fits the experimental data well for samples with small-signal transmission of greater than 20%. (9 refs.)

71200 Absorption and depletion effects on degenerate four-wave mixing in homogeneously broadend absorbers. W.P.Brown (Hughes Res. Labs., Malibu, CA, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.629-34 (May 1983).
The coupled equations satisfied by the pump, probe, and signal waves in a four-wave interaction in a two-level saturable absorber are derived, taking into account the effects of absorption and depletion. Numerical solutions of these equations are presented in two limits; one in which the probe-wave amplitude is small compared with that of the pump waves and another in which the probe- and pump-wave amplitudes are comparable. The results indicate that absorption effects are important when the wave amplitudes are less than the saturation amplitude of the absorption process. The importance of the depletion effects depends on the type of four-wave interaction. The most significant effects occur when the undepleted theory predicts probe-wave reflectivities exceeding unity. (6 refs.)

71201 Theory of saturated line shapes in phase-conjugate emission by resonant degenerate four-wave mixing in Doppler-broadened three-level systems. D.Bloch, M.Ducloy (Lab. de Phys. des Lasers, Univ. Paris-Nord, Villetaneuse, France).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.635-46 (May 1983).
The authors present a theoretical study of phase-conjugate (PC) emission by backward degenerate four-wave mixing (DFWM) processes in a resonant gas medium. In this study, high-intensity (pump) saturation and Doppler broadening are simultaneously taken into account. The authors develop a general formalism to deal with the saturation effects in the case of a three-level atom (with degenerate frequencies) and obtain analytical expressions of the PC field amplitude (after integration over the velocity distribution) under the following conditions: (1) the probe beam and one of the pump beams have intensities weak enough to be treated at the lowest perturbation order, whereas the other pump intensity is arbitrarily high; (2) the probe crosses the standing pump wave at grazing incidence. It is shown that the saturation induced by the forward pump (copropagating with the probe beam) leads to entirely different behaviour of the nonlinear susceptibility from that induced by the backward pump (counterpropagating with the probe beam). This saturation anisotropy is specific to the inhomogeneous broadening of the gas medium, which is also responsible for the frequency splitting experimentally observed in the intensity line shape of the PC emission or large pump intensities. At saturation, this splitting is theoretically shown to be proportional to the Rabi frequency, with a proportionality coefficient critically dependent on the relaxation processes: in the case of a single-relaxation model, the splitting is equal to 1.5 times the Rabi frequency. The PC intensity line shape is demonstrated to be of disperive origin in the case of backward saturation whereas for forward saturation, narrow structures are predicted in both real and imaginary parts of the nonlinear susceptibility, also leading to the intensity line-shape splitting. (38 refs.)

71202 Degenerate four-wave mixing in semiconductor-doped glasses. R.K.Jain, R.C.Lind (Hughes Res. Labs., Malibu, CA, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.647-53 (May 1983).
The authors report degenerate four-wave mixing (DFWM) of visible radiation in borosilicate glasses doped with crystallites of the mixed semiconductor CdS_xSe_{1-x}. These semiconductor-doped glasses—available commercially in the form of colored glass filters—exhibit third-order nonlinearities of $\sim 10^{-9} = 10^{-8}$ esu for DFWM with short ($\sim$10-nsec) laser pulses at various visible wavelengths. The authors studies on the temporal decay of the transient gratings indicate that the nonlinearity is not thermal in origin but may be attributed to the generation of a short-lived electron-hole plasma. In contrast with DFWM experiments in other semiconductors invoking gratings of optically generated carriers (or other mobile particles), the authors report unique diffusion-independent decay of the gratings in these glasses; this is deduced from the dependence of the intensity and polarization of the DFWM signal on the polarization combinations of the input beams. Finally, the authors report detailed data on the aberration-correction properties of these isotropic glasses. (33 refs.)

71203 Intracavity resonant degenerate four-wave mixing; bistability in phase conjugation. G.P.Agrawal (Dept. of Phys., City Coll., City Univ of New York, New York, NY, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.645-60 (May 1983).
A general formalism is developed to study intracavity phase conjugation through resonant degenerate four-wave mixing. The effects of spatial hole burning arising from interference of the counterpropagating pump waves, are fully incorporated. The analysis is applied to discuss intracavity phase conjugation in nonlinear media that can be modeled using either a two-level system or a Λ-type three-level system. In both cases, the phase-conjugate reflectivity exhibits bistability for an appropriate choice of the input parameters. For a two-level system, the tuning characteristics of the Fabry-Perot cavity significantly affect the phase-conjugate spectrum that displays hysteresis when the cavity is detuned from the applied laser frequency. (28 refs.)

71204 Compensation of phase distortions in a single-transit wavefront-reversal system with a degenerate four-photon interaction. M.S.Barashkov, I.N.Matveev, V.M.Petnikova, A.F.Umnov, N.D.Ustinov, V.V.Shuvalov.
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1524-5 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2340-1 (Nov. 1982). [received: May 1983]
A proposal is made for a system designed to compensate phase distortions in a wavefront-reversal system in which some part of the signal radiation is deflected to pass through a spatial frequency filter and then acts as the pump; the remainder of such radiation acts as the signal. It is shown that a suitable selection of the pass band of the filter can ensure compensation of large-scale phase inhomogeneities in the system and can enable reconstruction of a small-scale structure of an object. 71205 Prolongation structure for the reduced Maxwell-Bloch equations describing the two-photon self-induced transparency. A.I.Maimistov, E.A.Manykin (Moscow Engng. Phys. Inst., Moscow, USSR).
Phys. Lett. A (Netherlands), vol.95A, no.5, p.216-18 (2 May 1983).
The reduced two-photon Maxwell-Bloch equations are shown to have the nontrivial prolongation structure of Wahlquist and Estabrook (see J. Math. Phys., vol.16, p.1, 1975). As a result, the associated Lax representation is determined. (12 refs.)

71206 Elliptical billiard-ball echo model. R.Beach, B.Brody, S.R.Hartmann (Dept. of Phys., Columbia Univ., New York, NY, USA).
Phys. Rev. A (USA), vol.27, no.5, p.2537-47 (May 1983).
The billiard-ball echo model is expanded to include the effects of using sub-Doppler-linewidth lasers in photon-echo experiments. The simple heuristic model which emerges explains such echo phenomena in gases as the echo time width and the degradation of echo intensity with angling of the excitation pulses. The authors derive simple results in the small-pulse-area limit and give formal expressions for excitation pulses of arbitrary area. (3 refs.)

71207 Self-focusing of Gaussian beams: an alternate derivation. P.-A.Belanger, C.Pare (Dept. de Phys., Univ. Laval, Quebec City, Quebec, Canada).
Appl. Opt. (USA), vol.22, no.9, p.1293-5 (1 May 1983).
It is shown that self-focusing can be taken into account in an optical paraxial system by simply defining a new generalized radius of curvature, namely $1/q^{NL}=1/R-[j(\sigma^{1/2})/\pi W^2]\lambda$ where $(\sigma-1)$ is the ratio of the power of the beam to the critical power for self-focusing. (4 refs.)

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.6, p.167-70 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.6, p.1203-7 (1982). [received: April 1983] (Proceedings of the Fifth All-Union Conference on Nonresonant Interaction of Optical Radiation with Matter, Leningrad, USSR, 1-4 Dec. 1981).
Ultrashort light pulses are traditionally used to measure picosecond relaxation times, and the lengths of these should be substantially less than the relaxation times. However, at present the production of ultrashort light pulses is complicated. The authors describe a method of measurement that does not require such pulses. This has been used to measure relaxation times for some bleaching dyes. A laser with a broad generation spectrum constituted by a large number of fluctuation excursions was used. The essence of the method consists in examining the self-diffraction of the beams on passing through the medium. The following scheme is used to examine the self-diffraction. A medium with nonlinear response (a solution of a bleaching dye) placed in the region of intersection of two light beams was examined. The light produces a bleaching lattice in the dye in accordance with the interference structure from the overall field of the incident beams. In that case, the passage of the beams through the medium is accompanied by self-diffraction, i.e. diffracted beams deviated by a definite angle observed at the exit. (5 refs.)

42.72 OPTICAL SOURCES AND STANDARDS

(for spectroscopic light sources, see also 07.65)

71210 Fast-acting optical radiation source. A.S.Prokhorenko, N.N.Shavel' (Sci.-Res. Inst. of Appl. Phys. Problems, State Univ., Minsk, Belorussian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1004-6 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.202-4 (July-Aug. 1982). [received: May 1983]
Characteristics are presented for light-diodes based on GaAs tunnel diodes. For pumping current pulse amplitudes >1 Å the lag in optical radiation is ≤0.1 nsec. The rise time of the transient radiation intensity characteristics of the light diodes is 0.08-0.2 nsec for different pieces. Recommendations are given on the exploitation of the described light diodes. (5 refs.)

71211 The CSI 1000 W lamp as a source for solar radiation simulation. P.Krusi, R.Schmid (Dept. of Mech. Engng., Univ. of Sydney, Sydney, NSW, Australia).
Sol. Energy (USA), vol.30, no.5, p.455-62 (1983).
In recent years the Thorn manufactured CSI 1000 W lamp has been employed as radiation source for a number of solar simulators to test solar collectors. Claimed properties such as good spectral match to air mass two solar spectrum and long lifetime (1000 hr) as well as features like built-in and sealed reflector, ease of electrical control, relatively low cost per unit luminous flux and low running cost seem to render the CSI lamp ideal for collector testing. The objective of the note is to analyze these properties of the CSI lamp and to compare them with the ASHRAE requirements for solar simulators. (9 refs.)

71212 Optimisation of input variables of reflecting prisms with normal incidence of the paraxial ray of a beam at the point of input. J.Klabazna.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.3, p.79-83 (March 1983). In Czech.
Describes a method for optimal design of optical systems with regard to minimisation of the prism geometry. The following problems are dealt with and illustrated with examples: intersection of a plan-parallel plate and cone; and intersection of a coaxial plan-parallel plate, cylinder and cone. *E.D.*

71213 Measurements of the distribution of the flux of energy in the focus of a solar concentrator with visualization techniques. P.Ottonello, G.A.Rottigni (Istituto di Sci. Fisiche., Univ. di Genova, Genova, Italy).
Nuovo Cimento C (Italy), vol.5C, ser.1, no.5, p.515-27 (Sept.-Oct. 1982). [received: May 1983]
Analyses the setting-up of an optical head which allows the visualization of a section of the distribution of the flux of energy along the focal axis of optical systems in general and of solar concentrators in particular. A circular-type concentrator, with the reflector consisting of a plastic lamina aspirated by means of a pump, has been built. The distribution of the energy flux in the focus of this concentrator has been calculated theoretically. Results are compared with experimental data obtained by means of the optical head. (11 refs.)

71214 Geometrical concentration characteristics of a linear Fresnel reflector using a fin receiver. A.K.Singhal, R.N.Singh (Dept. of Phys., Indian Inst. of Technol., New Delhi, India), T.C.Kandpal, S.S.Mathur.
Opt. Appl. (Poland), vol.12, no.3-4, p.273-81 (1982).
The possibility of using a fin receiver with a linear Fresnel reflector has been explored. The geometrical design and performance characteristics of such a concentrator-receiver system have been studied. Numerical calculations have been made for some typical concentrator-receiver designs. Results are plotted graphically and discussed. (7 refs.)

71215 Geodetic and two-layer lenses based on dielectric diffusion light-guides. J.Kruszewski, M.Gutkowski, K.Jedlinski (Inst. of Electron Technol., Tech. Univ. of Warsaw, Warsaw, Poland).
Opt. Appl. (Poland), vol.12, no.3-4, p.293-301 (1982).
Describes the production methods for two types of lenses used in integrated optics, i.e. the geodetic and hybrid two-layer lenses. Also, the authors present the element parameters. (6 refs.)

71216 Correcting method for light scanning error of rotating polygonal mirror. T.Matsuda, T.Mikami, F.Abe (Peripheral Devices Lab., Fujitsu Labs. Ltd., Kawasaki, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.2, p.137-44 (Feb. 1983). In Japanese.
An electrical correcting method for light scanning error caused by a rotating polygonal mirror is described. Rotating polygonal mirrors are widely used in image input/output equipment. The authors show that light scanning error caused by facet flatness error is corrected by compensating the period of a pixel control clock in accordance with a light scanning time measured at each scanning. It is also shown that variation of light scanning velocity is simultaneously compensated. The correcting method has been successfully applied to a laser printer with high printing speed and high resolution. (11 refs.)

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.1-5
Describes how a lithium niobate $LiNbO_3$ birefringent filter can be used as a temperature sensor by analysis of the change in its optical transmission spectrum with temperature. A preliminary system has been made using fibre optic transmission to and from the sensor. (15 refs.)

Fringe benefits: applications of holographic elements .... See Entry 71088

42.80D Monochromators

71222 Simple mechanism for in situ adjustment of gratings in UHV monochromators. W.A.M.van Bers, A.J.J.Franken, P.K.Larsen (Philips Res. Labs., Eindhoven, Netherlands).
Rev. Sci. Instrum. (USA), vol.54, no.5, p.637-8 (May 1983).
A mechanism is described for adjustment under ultrahigh vacuum of the optical alignment of gratings in a vertically dispersing grazing incidence monochromator. The mechanism is based on two pairs of broad leaf springs and it allows rotation of the grating, of up to one degree, around two mutually perpendicular axes with respect to the photon energy scan axis. Measurements for a grazing incidence monochromator show that to achieve optimum resolution the adjustment of the grating should be better than 0.1°. (2 refs.)

71223 Optical polarizers for the ultraviolet. G.J.Sonek, D.K.Wagner, J.M.Ballantyne (Nat. Res. & Resource Facility for Submicron Structures, Cornell Univ., Ithaca, NY, USA).
Appl. Opt. (USA), vol.22, no.9, p.1270-2 (1 May 1983).
Large area ($\sim$6-cm^2) planar optical polarizers have been fabricated which polarize at deep UV wavelengths and are at the same time highly transmissive. The double-shadowing technique has been employed to generate parallel plate waveguide structures with periodicities of 1150 Å and an operating wavelength of 2000 Å. Transmission of better than 57% and extinction ratios of 0.41 have been achieved by these UV grating polarizers. The SiO_2 gratings fabricated have periods of 2300 Å and linewidths of 900 Å. The deposition of 250 Å of aluminium along the grating sidewalls produces waveguide structures whose metallic plates are separated by 900 Å. (5 refs.)

42.80K Optical beam modulators

71224 Use of an ADP four-crystal electrooptic modulator in ellipsometry. A.Moritani, Y.Okuda, J.Nakai (Dept. of Electronic Engng., Osaka Univ., Osaka, Japan).
Appl. Opt. (USA), vol.22, no.9, p.1329-36 (1 May 1983).
Some theoretical considerations and experimental techniques in application of an ADP 45° X-cut four-crystal electrooptic modulator (EOM) to fast retardation modulation ellipsometry are described, emphasis being placed on the thermal stabilization. First to solve the thermal instability problem and to analyze systematic errors resulting from use of the EOM, the Jones matrix for the EOM is theoretically constructed which includes the effect of axial misalignment of the ADP crystals, multiple reflection at crystal-matching-dielectric liquid interfaces, temperature differences among the four crystals, and modulator cell windows. As a result, temperature-dependent factors in EOM characteristics are made clear. Second, a practical matrix form of the Jones matrix is determined from experiments on the bias-voltage dependence of the transmitted light intensity. Last, a thermal stabilization technique introduced by the matrix representation is demonstrated in the application of the EOM to ellipsometry, which enables one to obtain ellipsometric parameters of a sample, (Ψ,Δ), independent of the thermal drift and imperfections that accompany the EOM. (21 refs.)

71225 Electro-optical light modulation in InGaAsP/InP double heterostructure diodes. H.G.Bach, J.Krauser, H.P.Nolting (Heinrich Hertz Inst. fuer Nachrichtentech. Berlin GmbH, Berlin, Germany), R.A.Logan, F.K.Reinhart.
Appl. Phys. Lett. (USA), vol.42, no.8, p.692-4 (15 April 1983).
The linear electro-optic coefficient r_{41} was determined in quarternary double heterostructure waveguides containing a p-n junction. Over the limited range of measurements, it is independent of wavelength and composition with a value $r_{41}=-1.4\times10^{-10}$ cm/V. A strong quadratic electro-optic effect has been identified for the first time, which strongly depends on the band gap and photon energy as does the associated electroabsorption effect. (11 refs.)

71226 Subpicosecond electrical sampling. J.A.Valdmanis, G.A.Mourou, C.W.Gabel (Lab. for Laser Energetics, Univ. of Rochester, Rochester, NY, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.664-7 (April 1983).
Reports on the recent advances of an electrooptic sampling technique for the characterization of electrical transients that has now achieved an unprecedented temporal resolution of less than 1 ps. Voltage sensitivity is on the order of 50 μV. A lithium tantalate traveling wave Pockels cell is employed in conjunction with a high repetition rate subpicosecond laser system. (18 refs.)

71227 Picosecond pulse response of broad-band guided-wave interferometric light modulators. M.Izutsu, T.Sueta (Dept. of Electrical Engng., Osaka Univ., Osaka, Japan).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.668-74 (April 1983).
Analyzes the time responses of phase and intensity modulators of the traveling-wave type, and the modulated output waveforms related to the modulating pulses are discussed. It is shown that there is an optimum interaction (or electrode) length of the modulator whereby the drive voltage is minimized for

a desired output pulse width. The traveling-wave push-pull light intensity modulator of Ti-diffused LiNbO$_3$ waveguides was modulated by a pulse train of 1 GHz repetition frequency, and the modulated output was observed by the image tube streak camera modified for sinusoidal scan at the same frequency. The duration of the modulated light pulses was less than 45 ps, which shows good agreement with the predicted one. (11 refs.)

71228 Effect of axial misalignment and multiple reflection on Jones matrix of a four crystal light modulator. A.Moritani, J.Nakai (Faculty of Engng., Osaka Univ., Suita, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.2, p.129-36 (Feb. 1983). In Japanese.
The authors describe the effect of axial misalignment and multiple reflection on the Jones matrix of an ADP (or KDP etc.) 45° X-cut four crystal light modulator. First, dielectric tensors of the crystals with axial misalignment are derived and then the Jones matrix representation is obtained by use of Berreman's 4×4 matrix formulation. Calculated results show that nondiagonal terms sensitive to temperature fluctuation arise from axial misalignment of the crystals and that complicated but small effect of multiple reflection at crystal-dielectric liquid interfaces appears in the diagonal terms. (9 refs.)

42.80L Optical waveguides

(for fibre optical waveguides, see 42.80M)

71229 Wave scattering and guidance by dielectric waveguides with periodic surfaces. S.L.Chuang, J.A.Kong (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.669-79 (May 1983).
Stratified media with periodic surfaces have been used in waveguide-input and waveguide-output couplers and distributed-feedback lasers. The authors apply the extended-boundary-condition approach to treat the problem of scattering and guidance by stratified media with period surfaces for both the Te and TM polarizations in a unified manner with the use of a transition matrix. Theoretical results are shown to compare well with the experimental data for metallic gratings with surface-plasmon excitations. The anomalous behaviour of the diffraction efficiencies is explained with the evanescent Floquet waves, which are excited with incidence angles corresponding to the locations of the dips in the total reflected efficiency plots. Diffraction efficiencies are plotted for wave scattering from corrugated thin-film waveguides with an angle of incidence near that for the waveguide-mode excitation. The guiding constants are also calculated and compared with the results obtained by other numerical methods. The origins of the imaginary parts in the guiding constants are discussed in light of the nonevanescent waves excited in the substrate. (39 refs.)

71230 Orthogonality and normalization of radiation modes in dielectric waveguides: an alternative derivation. C.Vassallo (CNET, Lannion, France).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.680-3 (May 1983).
Radiation modes in arbitrary dielectric waveguides with homogeneous cladding can be split into a free-space field having its sources at infinity and a scattered field excited by the polarization of the core region. In a recent paper, Sammut [J. Opt. Soc. Am. 72, 1335 (1982)] stated that radiation modes have the same orthogonality properties as their free-space parts in lossless waveguides. An alternative derivation is established, and connected with earlier work is also reviewed. (6 refs.)

71231 Hamiltonian analysis of beams in an optical slab guide. W.K.Kahn, S.Yang (Dept. of Electrical Engng. & Computer Sci., School of Engng. & Appl. Sci., George Washington Univ., Washington, DC, USA).
J. Opt. Soc. Am. (USA), vol.73, no.5, p.684-90 (May 1983).
The formal analogy between Hamiltonian classical mechanics and quantum mechanics on the one hand and geometrical optics and physical optics on the other hand is systematically presented. When the time is replaced by the axial coordinate of a cylindrically uniform optical system and Hamilton's principle replaced by Fermat's principle, classical particle trajectories correspond to rays and quantum-mechanical wave functions to physical-optics fields. The operator formalism of quantum mechanics then provides elegant solutions for problems associated with propagation of beams in a gradient-index multimode optical slab guide. (25 refs.)

71232 Calculation of the phase sensitivity of a thin-film controlled coupler. K.S.Buritskii, E.M.Zolotov, V.A.Chernykh (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1498-9 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2308-10 (Nov. 1982). [received: May 1983]
A calculation is made of the phase sensitivity of a controlled directional coupler based on diffused LiNbO$_3$:Ti channel waveguides. Diagrams are given for determining the value of the voltage at which the maximum phase sensitivity is obtained. (13 refs.)

71233 Fabrication and investigation of thin-film CdS$_x$Se$_{1-x}$ waveguides. Z.E.Buachidze, I.V.Vasilishcheva, V.N.Morozov, V.A.Pietnev, A.S.Semenov, P.V.Shapkin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1514-16 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2329-30 (Nov. 1982). [received: May 1983]
The diffusion method was used to fabricate CdS$_x$Se$_{1-x}$ solid-solution waveguides with losses in the range 9-13 dB/cm. The refractive index profile of these waveguides was determined. Photochemical etching of the waveguide surface was employed to form diffraction gratings with 10^3 lines/mm and a relief 40-nm deep. (7 refs.)

42.80M Fibre optics

71234 Technical and economic aspects of the different fibre fabrication processes. G.J.Koel (Philips Glass Div., Eindhoven, Netherlands).
Ann. Telecommun. (France), vol.38, no.1-2, p.36-46 (Jan.-Feb. 1983).
The processes for making preforms for hard glass fibres are the VAD process, the OVD process, the MCVD (PMCVD) process and the PCVD process. This paper discusses the processes themselves, the optical properties of multimode, single-mode and high NA fibres made with these processes and the potentials of the different processes. For really large scale applications it will be necessary to reduce the costs of manufacturing these fibres. The factors that determine these costs are discussed and ways in which they can be reduced are indicated. (25 refs.)

71235 Experimental study of monomode fibres with a depressed inner cladding. J.J.Bernard, C.Brehm, J.-Y.Boniort, Ph.Dupont (Lab. de Marcoussis, CGE, Marcoussis, France), J.-M.Gabriagues, C.Le Sergent, M.Liegois, P.Francois, M.Monerie, P.Sansonetti.
Ann. Telecommun. (France), vol.38, no.1-2, p.47-52 (Jan.-Feb. 1983). In French.
This paper presents some results of an experimental investigation of fibres with a depressed inner cladding (W type). It has been confirmed that fibers with low losses and weak dispersion in the 1.3-1.7 μm range can be achieved. The sensitivity to fabrication parameters is very important. Information is given on preform fabrication and index profile measurements. (8 refs.)

71236 Progress in fiber test standards. R.L.Gallawa, D.L.Franzen.
Photonics Spectra (USA), vol.17, no.4, p.55, 58, 60, 62, 64, 66, 68 (April 1983).
Reviews the state-of-the-art in setting important standards, and prospects for the future. The authors provide a glossary of terms, fiber attenuation, fiber bandwidth, and refractive index profile, the last of which leads to the determination of core diameter. (14 refs.)

71237 OTDR puts fibers to the test. C.Flatau.
Photonics Spectra (USA), vol.17, no.3, p.47-50 (March 1983).
For general-purpose measurements, optical time domain reflectometry (OTDR) is a key technique for testing optical systems for many of the needed qualities. Typically, an OTDR instrument consists of a laser source, a beamsplitter and a photodetector. During OTDR measurement, a laser pulses an optical fiber, the reflections are directed to the photodetector, and the resulting backscatter waveform is displayed. Two types of reflection occur during the measurement: Fresnel reflection occurring at fiber breaks or fiber ends; Rayleigh scattering caused by fluctuations in atomic concentration and other glass inhomogeneities. Fresnel reflection helps in evaluating connectors and in locating fiber breaks: Rayleigh scattering, on the other hand, provides information on the attenuation of the fiber. Some waveform analysis can be done visually from the OTDR display. Signal averaging allows increased dynamic range and noise reduction, so as to permit small reflections from defects or not-so-clean fiber breaks to be revealed. (no refs.)

71238 Microbending effects on monomode light propagation in multimode fibers. F.de Fornel, J.Arnaud (Lab. d'Electronique des Microondes, Limoges Univ., Limoges, France), P.Facq.
J. Opt. Soc. Am. (USA), vol.73, no.5, p.661-8 (May 1983).
The effects of periodic axis deformations on propagation in multimode optical fibres with single-mode excitation are investigated numerically and experimentally. The numerical study, based on ray theory, deals with helical rays in the presence of sinusoidal deformations for various shapes of index profile. The corresponding experimental observations and results, carried out on tubular modes confirm the existence of resonance effects between the helical ray period and the fiber axis deformation. This technique permits the observation of mode-to-mode power transfer and provides a sensitive tool to investigate the mode-coupling mechanism in optical fibers. (6 refs.)

71239 Local detection for splice loss in optical fiber. M.Sato, N.Kashima (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.J66B, no.2, p.255-6 (Feb. 1983). In Japanese.
A leakage light distribution suitable for the detection at the near part of the splice point was obtained by covering the splice point with a high refractive index hyaline material which contains scattering matter. The relation between leakage light power and splice loss was measured. (3 refs.)

71240 Extremely low-loss optical waveguide for vacuum ultraviolet light. T.Hidaka (Electrotech. Lab., Ibaraki, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.2, p.153-4 (Feb. 1983). In Japanese.
A new type of extremely low-loss optical waveguide is proposed which uses the fact that the refractive index n at vacuum ultraviolet frequency is smaller than unity due to plasma vibration of electrons. The waveguide transmission loss at 50 nm wavelength is expected to be 0.05 dB/km for 0.1 mm core waveguide. (5 refs.)

71241 Characteristics of twisted single-mode optical fiber for current sensor. M.Kuribara, Y.Takeda (Central Res. Inst. of Electric Power Industry, Komae, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.2, p.173-4 (Feb. 1983). In Japanese.
As single-mode optical fibers act as the transducer as well as the beam guide, they are useful for current measurements on high-voltage lines. One of the most significant problems for an optical current sensor using the Faraday effect is to conserve the linearly polarized light in the fiber. The authors show experimental results for the polarization conservation of twisted single-mode optical fibers and the characteristics of the sensitivity for current measurements. With this fiber, $\simeq$100 rad./m twisted, the current measurement is performed for 2 to 55 kAT. For these magnetic fields linear results are obtained, and the sensitivity of this fiber is $\simeq 2.3\times10^{-6}$ rad./AT. (5 refs.)

71242 Fiber optics sensing techniques. W.H.Quick, K.A.James, J.E.Coker.
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.6-9
A digital, fiber-optic temperature sensor using a variable Fabry-Perot cavity as the sensor element was analyzed, designed, fabricated and tested. A microprocessor based color demodulation system converts fiber-transmitted cavity reflection spectra to temperature. The complete temperature sensor system was evaluated in the laboratory. Results show that the Fabry Perot

temperature sensor has good resolution (.05% of full scale), high accuracy, and potential for high temperature (>1000°C) applications. (no refs.)

71243 Differential absorption distributed thermometer. E.Theocharous (Central Electricity Res. Labs., Leatherhead, England).
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.10-12
The operation of a practical fibre optic distributed thermometer was successfully demonstrated. It relies on the strong temperature dependence of the absorption profile of the ruby glasses. A differential absorption method is employed in combination with the backscattering technique to monitor the absorption profile and thus the temperature of a number of small sensors distributed along the length of an optical fibre. (6 refs.)

71244 Sensitivity vs. size of fibre-optic interferometric sensors. R.Ulrich (Tech. Univ., Hamburg-Harburg, Germany).
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.17-22
The sensitivities $S=d\phi/dx$ are compared for a number of fibre-optic interferometric sensors, all employing elastic strain in a single-mode fibre. The quantity x, which is to be measured, may be an acoustic pressure, or a magnetic or electric field strength, requiring a suitable transducing element in the form of an elastic, magnetostrictive or piezo-electric body, respectively. A variety of such sensor arrangements are considered. For many of them the sensitivity can be optimized by balancing the force produced by x and the reactive force from the elastic strain in the fibre. In all cases the optimum sensitivity at low frequencies is found to scale as $S_{opt}=\Gamma V/\lambda A_o$ with the geometric parameters of the sensor. In this relation, V denotes a characteristic volume of the transducing body, A_o is the cross-sectional area of the fibre, and λ the vacuum wavelength of the light in the interferometer. The coupling constant Γ is largely independent of the specific design (V, A_o, λ) of the sensor, it is determined mainly by material parameters. (7 refs.)

71245 Optical fibre hydrophones with down lead insensitivity. M.L.Henning, S.W.Thornton, R.Carpenter, W.J.Stewart, J.P.Dakin, C.A.Wade.
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.23-7
Describes an interferometric system in which the phase stability of an heterodyne is achieved with the simplicity of a homodyne, leading to a completely passive underwater system with no environmental noise problems on the leads to and from the sensor head. Its laboratory performance, before optimisation, is adequate for many underwater applications, and it has potential for particular use in large scale area coverage. The use of such sensors in underwater arrays is practicable and with suitable optical multiplexing it will be possible to form steerable beams. It seems reasonable to expect that eventually, performance will be adequate for the majority of underwater applications and that incorporation of integrated optical techniques will allow the full utilisation of the particular advantages of optical fibres in underwater acoustic sensors. (9 refs.)

71246 Interferometric sensor using phase conjugate mirrors. Ph.Graindorge, H.J.Arditty, H.C.Lefevre (Lab. Central de Recherches, Thomson-CSF, Orsay, France).
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.28-32
The authors have proven the feasibility of a conjugate mirror fiber optic interferometric sensor, containing no optics or alignments and relying on the auto-oscillation provided by the high gain four wave mixing (photo-refractive) process in barium titanate. The self compensating properties of this scheme makes it particularly well suited to the hydrophone application. An interesting, but unexpected, self biasing has been observed and is now under investigation, and this aspect could be taken advantage of in other fiber optic sensors. The spatial conjugation capability of the photorefractive process could also allow the replacement of monomode fibers by multimode fibers when more advantageous, without losing the reciprocal behaviour characteristic of monomode fibers. The experiment was carried out at 514 nm (Ar-ion laser); for practical devices, materials exhibiting the same properties at solid state source wavelength need to be found. (16 refs.)

71247 Detection techniques for measurement of DC magnetic fields using optical fibre sensors. R.E.Jones, J.P.Willson, G.D.Pitt, R.H.Pratt, K.W.H.Foulds, D.N.Batchelder (Standard Telecommunication Labs. Ltd., Harlow, England).
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.33-7
A modified Mach-Zehnder interferometer has been constructed using optical fibres in both sensor and reference arms. Particular emphasis has been placed on developing a system useful for practical field sensing applications. To this end a detector configuration using a photodiode array and microcomputer was used and found to overcome several of the sources of noise and lack of sensitivity in conventional systems. Results have been presented which demonstrate metallic glasses to be suitable magnetostrictive materials for optical fibre magnetometers. Remaining sources of noise have been analysed and suggestions made regarding further improvements to the system. (7 refs.)

71248 A single-mode fibre Michelson interferometer sensor. R.Kashyap, B.K.Nayar (British Telecom Res. Labs., Martlesham Heath, Ipswich, England).
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.38-42
The authors have demonstrated for the first time, the use of a single-mode all fibre Michelson interferometer for sensing applications. This interferometer configuration is simpler than the Mach-Zehnder generally used and preliminary results indicate that similar performance can be expected. Remote sensing has also been demonstrated with the sensor operating over a kilometer of optical fibre. Although quadrature locking was demonstrated using two photodiodes, the interferometer can be locked to any point in the interferogram by the use of a single photodiode using the method proposed by Olsson et al. (1980). The use of this configuration with a larger tuning range of a semiconductor laser diode, would be particularly suited to remote sensing applications such as a hydrophone, where it may be desirable not to have any submersible power feed or electronics, allowing signal detection and processing to be carried out at the source end. (10 refs.)

71249 Signal recovery techniques for unbalanced fibre interferometric sensors illuminated by laser diodes. A.D.Kersey, M.Corke, J.D.C.Jones, D.A.Jackson (Univ. of Kent, Canterbury, England).
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.43-7
Describes two methods by which the dependence of the emission frequency of GaAlAs lasers on injection current can be used to achieve the recovery of signal phase shifts between the arms of an unbalanced interferometric sensor. These methods fall into the categories of: (i) pseudo heterodyne and (ii) passive homodyne detection. The schemes achieve the recovery of signal phase shifts in an interferometric sensor free of the signal fading which would otherwise affect the output. Minimum detectable signal phase shifts obtained using the detection schemes were found to be close to the fundamental limit set by the frequency jitter (phase noise) of the diode laser used. (9 refs.)

71250 Fiber optic interferometric sensor development at NRL. A.Dandridge, A.B.Tveten, R.O.Miles, T.G.Giallorenzi (Naval Res. Lab., Washington, DC, USA).
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.48-52
Briefly discusses some of the aspects of fiber optic interferometric sensor research with special emphasis given to noise sources (and noise reduction), demodulation schemes and packaging. (19 refs.)

71251 Optical fibre sensor markets. A.L.Harmer (Battelle Res. Inst., Geneva, Switzerland).
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.53-6
Attempts to provide an assessment of the f.o. sensor markets taken from the research standpoint. The first part of the paper looks at current world-wide research activities, the major government-funded and private programmes, the types of sensors that are being developed, and the applications foreseen. The second part tries to relate this research effort to needs and potential markets. The importance of rival technologies, such as new developments in semiconductor sensors and smart sensors, must also be considered in determining the future impact of optical fibre sensors in instrumentation. (4 refs.)

71252 Current electron-optical apparatus based on time-analyzing electron-optical converters. B.Z.Gorbenko, B.M.Stepanov (All-Union Phys. Optics Res. Inst., Moscow, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.985-8 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.185-8 (July-Aug. 1982). [received: May 1983]
Deals with Soviet commercial and experimental electron-optical cameras based on time-analyzing electron-optical converters and also with some of the latest models of foreign commercial cameras, which together indicate the state of the art abroad. The cameras are classified in terms of the types of EOC used. Cameras are compared on the sweep times in photochronographic mode; brief technical characteristics are given of the cameras. (no refs.)

71253 Holistic system design maximizes night vision device performance. L.Bjork, L.Owen, J.Wagner, M.Lund, J.Kylander (Litton Industries, Tempe, AZ, USA).
Mil. Electron./Countermeas. (USA), vol.9, no.2, p.34-9 (Feb. 1983).
Considers the factors which influence the performance of a night vision system. The limiting factor in the optimum system design is the light amplifier or image intensifier. A wide range of tubes and devices for night vision systems are necessary to provide optimum and cost-effective second- and third-generation night vision equipment for the military. (no refs.)

71255 Bending property and allowable bending radius for unit-type optical cable. Y.Katsuyama, H.Kobayashi, Y.Mitsunaga, K.Harada, Y.Ishida (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.J66B, no.2, p.201-8 (Feb. 1983). In Japanese.
Describes a bending characteristics of unit-type optical cable. Approximate equations for a double spiral have been derived. The equations represent curvature, strain and loss increase of optical fiber in the bent cable. The bending characteristics were evaluated for the optical cables manufactured. The allowable bending radii R have been determined by theoretical and experimental results. The allowable values are $R=200$ mm for static bending and $R=600$ mm for dynamic bending under the conditions that no failure and no loss increase of the fiber occur for 20 years. (11 refs.)

An amorphous As_2S_3/liquid-crystal integrated optical switch is described and fabrication of rib waveguides in amorphous As_2S_3 films is reported. (3 refs.)

71258 Multistructured optical IC elements by polymer thin films. I.Kato, M.Komatsu (School of Sci. & Engng., Waseda Univ., Tokyo, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.2, p.145-8 (Feb. 1983). In Japanese.
Traditionally, thin film optical circuit elements are constructed by arranging optical waveguides side by side or crossing them on one plane. The authors report new type multistructured optical integrated circuit elements constructed by piling up thin film waveguides. A photochemical reaction is used to form waveguides in polymer thin films. As an example of these elements, directional couplers have been made using two and three thin film layers, in which waveguides cross over on two levels and light energy is transferred upward or downward between two waveguides directly and indirectly through a middle layer. The cross angle was increased from 0 to 4° giving the coupling coefficient of 3 to more than 12 dB. (4 refs.)

71260 Scattering of acoustic waves on free surface perturbations in an elastic half-space. F.Witos (Inst. of Phys., Silesian Tech. Univ., Gliwice, Poland).
Arch. Acoust. (Poland), vol.7, no.1, p.43-59 (1982).
Considers a semi-infinite, homogeneous and linearly elastic medium with a perturbed free surface. The perturbation is material loss. Using the Green function method, the first Born approximation is found for the field of displacements dependent harmonically on time. Subsequently the energy relations for the solutions obtained are calculated. The character and magnitude of scattering on the perturbation are thus defined for any mode occurring in a semi-infinite, homogeneous and linearly elastic medium. In addition, the case of perturbations described by periodic functions, which is essential in practice, is analyzed. (13 refs.)

71261 One-dimensional acoustic wave propagation in a particulate suspension. K.Nikaien, J.Peddieson,Jr., B.C.Au (Dept. of Mech. Engng., Tennessee Technol. Univ., Cookeville, TN, USA).
Int. J. Eng. Sci. (GB), vol.21, no.7, p.851-62 (1983).
Both Laplace and Fourier transforms are applied to the problem of one-dimensional acoustic wave propagation in a semi-infinite duct containing a particulate suspension. Both methods lead to closed-form solutions in terms of integrals which must be determined numerically. This is done, the methods are evaluated, and representative numerical results are presented and discussed. (5 refs.)

71262 Surface acoustic admittance of highly porous open-cell, elastic foams. R.F.Lambert (Dept. of Electrical Engng., Univ. of Minnesota, Minneapolis, MN, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1139-46 (April 1983).
This work presents a comprehensive study of the surface acoustic admittance properties of graded sizes of open-cell foams that are highly porous and elastic. The intrinsic admittance as well as properties of samples of finite depth were predicted and then measured for sound at normal incidence over a frequency range extending from about 35-3500 Hz. The agreement between theory and experiment for a range of mean pore size and volume porosity is excellent. The implications of fibrous structure on the admittance of open-cell foams is quite evident from the results. (7 refs.)

71263 Target strength of liquid-filled spheres. D.L.Folds, C.D.Loggins (Naval Coastal Systems Center, Panama City, FL, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1147-51 (April 1983).
The liquid-filled target sphere is a high target strength reflector which, since its first use in 1971, has proven to be of great utility in sonar research. The spherical metal shell filled with alow-velocity liquid is being used as a calibrated, passive, aspect-independent target. To date, the characteristics of this target have only been described in a narrow *ka* range by simple ray theory models. In this paper, a comprehensive treatment for $0<ka<100$ for various shell materials and filling fluid refractive indices is presented, using results from wave theory analyses. Comparisons are made with air-filled and water-filled spheres and with solid spheres. Form function versus *ka* plots, echo time history, and target strength versus frequency are presented. Results show good agreement between computed and measured target strengths and permit an accurate prediction of target strength over a wide range of frequency and fluid velocities. (8 refs.)

71264 Cavity resonances in engine combustion chambers and some applications. R.Hickling, D.A.Feldmaier, F.H.K.Chen, J.S.More (Engng. Mech. Dept., General Motors Res. Labs., Warren, MI, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1170-8 (April 1983).
Cavity resonances in engine cylinders are caused by combustion events such as the rapid rate of pressure rise that occurs during compression ignition in diesels or from knock in gasoline engines. These resonances generally occur at frequencies greater than 4 to 5 kHz where the engine structure is not an efficient acoustical radiator. However, when they occur at lower frequencies such as in engines with a large bore or in indirect injection diesels, they can be important in the noise generation process. They are also important for knock detection in gasoline engines. Current knock detection systems are tuned to the frequency band of the lowest cavity resonance in the combustion chamber. It is shown in the paper that higher order resonances can also be detected by a knock vibration sensor on the surface of the engine. Another use for the cavity resonances is to determine the bulk temperature of the gas in the combustion chamber as a function of crank angle. This technique is demonstrated in the paper for a heavy-duty two-stroke diesel. Also, the results of several fundamental investigations of cavity resonances in engine combustion chambers are reported briefly. Good agreement is obtained between theoretical prediction of the resonant frequencies and experimental observation. The splitting of degenerate modes into two components is discussed. (18 refs.)

71265 Inverse methods in the reconstruction of acoustical impedance profiles. H.Schwetlick (Dept. of Theoretical & Appl. Mech., Cornell Univ., Ithaca, NY, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1179-86 (April 1983).
Three methods for the reconstruction of inhomogeneities in a one-dimensional lossless medium from incident and reflected wave signals are presented in this paper: the method of characteristics, the Gel'fand-Levitan method, and the newly developed method of iterative local regulization. Reconstructed results from numerical experiments are compared with emphasis on inversion in the presence of noise, and on general excitations. An error analysis and a study of computation requirements are also presented. (12 refs.)

71266 Intensity variance of spherical waves in anisotropic media. M.Schulkin (Appl. Phys. Lab., Univ. of Washington, Seattle, WA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1187-91 (April 1983).
The solution to the problem of determining the intensity variance in the forward direction for spherical waves propagating in an anisotropic medium of Gaussian correlation oblate spheroids has not yet been reduced to elementary functions. However, the solution is known for asymptotic limits at zero range and at very long range where the anisotropic terms are separable in both cases. The author shows that anisotropic terms are also separable for the intensity variance of plane waves at the point where the variance depends on the square of the range. A new anisotropic component is found in this way. He also computes the ratio of the intensity variance for plane waves to that of spherical waves at all ranges in a random medium of Gaussian correlation spheres. Applying this ratio to the plane-wave anisotropic solution yields useful estimates for the variance of spherical waves in Gaussian anisotropic media in the region where the variance depends on the square of the range for both small and large anisotropy. (17 refs.)

71267 An alternative approach for formulating the backscattering equation in Sigelmann and Reid's method. K.K.Shung (Bioengng. Program, Pennsylvania State Univ., University Park, PA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1384-6 (April 1983).
The theoretical expression derived by Sigelmann and Reid (1973) for calculating backscattering coefficient from an ensemble of scatterers using a substitution technique can also be obtained directly by considering the intensity of the wave and existing scattering theorems. This approach is much simpler and clearly demonstrates the physical meaning of the experimentally determined backscattering coefficient. (17 refs.)

71268 Modeling and applications of straight-through resonators. P.T.Thawani (Corporate Res. Dept., Nelson Industries Inc., Stoughton, WI, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1387-9 (April 1983).
Straight-through concentric resonators have been modeled by coupling the acoustic wave propagation through the inner perforated pipe and the outer cavity by means of the radial particle velocity through the perforate holes. The decoupled equations of wave propagation are solved using the boundary conditions in the cavity resulting in a two-by-two transfer matrix. In this study the decoupling procedure was used for deriving the transfer matrix for a partially perforated straight-through resonator. This transfer matrix was used for predicting the transmission loss for some typical resonator configurations. Experimental and analytical results of several resonator configurations are presented showing good agreement. (9 refs.)

71269 A finite-difference treatment of interface conditions for the parabolic wave equation: the irregular interface. D.Lee (Naval Underwater Systems Center, New London, CT, USA), S.T.McDaniel.
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1441-7 (May 1983).
A finite-difference solution to the parabolic wave equation is extended to treat an irregular interface. Interface conditions are developed to preserve conti-

nuity of pressure and continuity of the normal component of particle velocity at the boundary between media having different sound speeds and densities. A complete mathematical treatment for the case of an irregular interface is presented. To demonstrate the method, numerical results are obtained for sound propagation from deep to shallow water. (6 refs.)

71270 Acoustic resonance scattering by a penetrable cylinder. D.Brill (US Naval Acad., Annapolis, MD, USA), G.C.Gaunaurd.
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.148-55 (May 1983).
Although sound scattering by submerged elastic cylinders has been the subject of many papers, it was only recently that this and similar problems have been examined in the light of the resonance scattering theory (RST). Crucial experiments have been performed recently at Le Havre, France, in which the modal resonances contained within the cylinder's backscattering cross section were isolated by means of a background subtraction, experimentally accomplished by a clever time-gating technique. In the present paper, the authors generate a variety of tailor-made calculations and graphical displays required to thoroughly examine those experiments in the light of the RST. For the same cylinder, liquids, and frequency ranges of interest they have produced many spectral graphs displaying all the model resonances that combine with the modal backgrounds to produce the observed and/or predicted cross sections. The calculations: (a) display the whispering gallery and Rayleigh-type poles in the complex frequency plane and show their connection with the target resonances they generate, which manifest themselves as circumferential waves around the target, (b) explain quantitatively why some of the modal resonances were missed in the experiment, (c) establish comparisons between predicted and observed monostatic and bistatic form functions (or cross sections) in a direct scattering mode of operation, and (d) show ways to improve both the monostatic and bistatic measurements performed at Le Havre, paving the way toward the solution of inverse scattering situations. Within the limits of simple shapes and compositions, and within the controlled environment of the laboratory, these favorable comparisons have satisfactorily validated many of the predictions of the RST in the field of acoustics. (25 refs.)

71271 Resonance reflection of acoustic waves by a perforated bilaminar rubber coating model. P.D.Jackins, G.C.Gaunaurd (Naval Surface Weapons Center, White Oak, Silver Spring, MD, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1456-63 (May 1983).
Constructs the prediction of the resonance scattering theory (RST) for the reflection of sound waves by a bilaminar rubber configuration separating two dissimilar semi-infinite acoustic media. The layers are further assumed to contain distributions of spherical air-filled perforations, of various concentrations in each layer, whose behavior is governed by a simple, static, 'effective parameter' model. The authors compare the direct scattering prediction of the RST to that of the exact solution in order to show the usefulness of the RST to yield clear physical interpretations of complex phenomena. The casting of the direct scattering solution in 'RST-form' also provides a systematic method to solve the inverse scattering problem for the composition of the bilaminar rubber configuration. The 'response surface' and response curves of the returned echoes are shown to contain certain modulation effects, described in the text, that actually characterize the material composition of each of the layers making up the coating model. The process disentangles which resonance feature present in the reflection coefficient is caused by which one of the interacting layers. In particular, the authors can separate and identify the impedances and the respective thickness-to-speed ratios (transit times) of each of the layers, and if additionally, either the thicknesses or the speeds are known, then, the process determines the other one and also the layer densities all from the resonances in the remotely sensed acoustic reflections. (17 refs.)

71272 Glory- and rainbow-enhanced acoustic backscattering from fluid spheres: models for diffracted axial focusing. P.L.Marston, D.S.Langley (Dept. of Phys., Washington State Univ., Pullman, WA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1464-75 (May 1983).
Transmitted-wave contributions to backscattering from large spheres are calculated. Amplitudes due to glory rays are enhanced, relative to those of axial reflections, because of focusing. The glory pressure amplitudes are proportional to $a(ka)^{1/2}$, where a is the sphere's radius and k is the wavenumber. The model, though similar in form to one for optical scattering from air bubbles [D.S. Langley and P.L. Marston, Phys. Rev. Lett., vol.47, p.913-916 (1981)], contains new features to facilitate the summing of amplitudes in a range of angles. An additional enhancement due to rainbow focusing is modeled for certain sound velocity ratios M; for these M the backscattered amplitude is proportional to $a(ka)^{2/3}$. Major features of the exact scattering are reproduced by these models when $ka=1000$ and (with defects) $ka=100$. The enhancements are not intrinsically due to resonance. Applications to the design of passive sonar targets are noted. (34 refs.)

71273 Low-frequency acoustic diffraction by a soft elliptic disk. A.Roy, F.J.Sabina (Inst. de Investigaciones en Matematicas, Aplicadas y en Sistemas, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1494-8 (May 1983).
The problem of the diffraction of an arbitrary incident plane sound wave by a soft-sound elliptic disk is studied. A Fredholm integral equation of the first class is posed and solved explicitly in the low-frequency limit up to terms of $O(\kappa^2)$, κ being the wavenumber, though higher order terms could be found in a similar fashion without much difficulty. The solution is new and expressions for the farfield amplitude (which are also believed to be new) and the scattering cross section are obtained to the same order. The limiting values when the ellipse degenerates into a circle agree with those of a circular disk found using other methods. Also the scattering cross section agrees with expressions obtained using alternative methods. (8 refs.)

71274 Crosscorrelation functions for directionally distributed energy fields. T.E.Barnard (Defense Electronics Div., Gould Inc., Glen Burnie, MD, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1505-19 (May 1983).
This paper presents the time-lag probability density function between two sensor outputs for several types of directionally distributed energy fields. The convolution of this density function with the inverse Fourier transform of an energy field's frequency power density spectrum is the crosscorrelation function between the two sensor outputs. (32 refs.)

71275 A series expansion of the acoustic power radiated from planar sources. E.G.Williams (Naval Res. Lab., Washington, DC, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1520-4 (May 1983).
A series expansion in ascending powers of the wavenumber k is derived for the acoustic power delivered by baffled or unbaffled planar sources. This series provides a relatively simple means of deriving expressions for the power radiated by a baffled source with a known velocity distribution and can be used for unbaffled plates when the velocity field outside the plate is also known. The terms in the series are calculated from the moments of this velocity distribution in the plane containing the source. If these moments are written as derivatives in wavenumber space, it is shown that a MacLaurin expansion of the Fourier transformed velocity provides an easy technique for computing the first few terms of the acoustic power. Examples are provided for baffled, rectangular plates with various boundary conditions. The arbitrarily shaped plate with free boundaries is particularly interesting. It is proven that the volume flow across its surface must be zero and as a result corner and edge mode radiation cannot exist for this kind of source. (18 refs.)

71276 Effect of the branch-cut on the transformation between modes and rays. Tain Fu Gao (Inst. of Acoustics, Acad. Sinica, Peking, China), Er-Chang Shang.
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1551-5 (May 1983).
In this paper the effect of the branch-cut on the transformation between the modes and rays is discussed. Characteristics of the bottom reflection coefficient on the ζ plane were analyzed in detail and a certain branch-cut was taken. Once the integral path of the generalized ray is deformed to the real axis of the ζ plane, the ray representation consists of 'canonical' generalized ray and a 'lateral term'. The mode representation and the ray representation are given as follows: Mode representation$=\Sigma_n^\infty\phi_n(r,z,z_0)+\oint_b$. Ray representation$=\Sigma_l^\infty B_l(r,z,z_0)+\Sigma_l^\infty\oint_{bl}$. It was found that the 'canonical' generalized ray B_l and the normal mode ϕ_n were still connected by the Poisson summation relation strictly, as proved by the authors' previous paper [Gao and Shang, J. Sound Vib., vol.80, p.105-115 (1982)]. The sum of the 'lateral term' of the 'canonical' generalized ray was exactly equal to the part of the 'lateral' wave in the mode representation: $\oint_b=\Sigma_l^\infty\oint_{bl}$. (5 refs.)

71277 Finite element formulations for acoustical radiation. R.J.Astley, W.Eversman (Univ. of Missouri, Rolla, MO, USA).
J. Sound & Vib. (GB), vol.88, no.1, p.47-64 (8 May 1983).
Finite and infinite element techniques are applied to linear acoustical problems involving infinite anechoic boundaries. Theory is presented for a simple one dimensional model based on Webster's horn equation. Results are then presented both for the one dimensional model and for two axisymmetric test cases. Comparisons with exact solutions indicate that both the infinite element and wave envelope schemes are effective in correctly predicting the near field. The wave envelope scheme is also shown to be capable of resolving the far field radiation pattern. (15 refs.)

71278 Reflection of spherical sound wave from a rigid cylinder of finite length in slightly oblique incidence. M.Ukigai (Chiba Inst. of Technol., Narashino, Japan), Gaoyuan, Y.Miida.
J. Acoust. Soc. Jpn. (Japan), vol.39, no.1, p.30-5 (Jan. 1983). In Japanese.
An analytical technique for calculating the amplitude of reflected sound wave from a cylindrical target of finite length for its slightly oblique incidence is described. This theory is treated on the assumption that a receiver is located separately from a transmitter. The formulas for the reflectivity are derived approximately under certain geometrical restrictions. The reflectivity is termed as the 'directional sound reflectivity of the cylindrical target', which is defined as the ratio of a reflectional sound pressure from a target to a calculated one which is treated due to the theory of geometrical optics. To verify the validity of the approach, some experiments are performed in air at the frequency of 39.80 kHz. Experimental results show good agreement between the calculated and the measured values and this confirms the usefulness of the technique to calculate the reflection of sound waves from a cylindrical target. (11 refs.)

71279 Measurement methods of waveguide systems designed for ultrasonic transmissions. J.Gorczynski, J.Ksiazek, A.Wojnar.
Pr. Inst. Tele- & Radiotech. (Poland), no.92, p.45-8 (1983). In Polish.
Presents measurement methods of waveguide systems used in technological ultrasonic equipment developed at the Ultrasonic Department Tele-and Radio Research Institute. Block diagrams of the measuring systems are given. (4 refs.)

71280 Ultrasonic wave propagation in a layered medium under different boundary conditions. A.Pilarski (Inst. of Fundamental Technol. Res., Warsaw, Poland).
Arch. Acoust. (Poland), vol.7, no.1, p.61-70 (1982).
Presents an analysis of the possibility of using the phase velocity measurements of surface or plate waves for the evaluation of the adhesive bond strength, i.e. of the adhesion degree in layered joints. Dispersive curves are determined for phase velocities in layer on base and layer on layer systems with two kinds of boundary conditions, i.e. welded and smooth ones, by numerical solutions of the characteristic equations. The procedure of deriving these equations for any number of layers is given. (13 refs.)

71281 Propagation of sound in highly porous open-cell elastic foams. R.F.Lambert (Dept. of Electrical Engng., Inst. of Technol., Univ. of Minnesota, Minneapolis, MN, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1131-8 (April 1983).
This work presents both theoretical predictions and experimental measurements of attenuation and progressive phase constants of sound in open-cell, highly porous, elastic polyurethane foams. The foams are available commercially in graded pore sizes for which information about the static flow resistance, thermal time constant, volume porosity, dynamic structure factor, and speed of sound is known. The analysis is specialized to highly porous foams which can be efficient sound absorbers at audio frequencies. Negligible effect of internal wave coupling on attenuation and phase shift for the frequency range 16-6000 Hz was predicted and no experimentally significant effects were observed in the bulk samples studied. The agreement between predictions and measurements in bulk materials is excellent. The analysis is applicable to both the regular and compressed elastic open-cell foams. (11 refs.)

71282 Finite amplitude method for the determination of the acoustic nonlinearity parameter B/A. W.N.Cobb (Appl. Mech., Yale Univ., New Haven, CT, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1525-31 (May 1983).
The acoustic nonlinearity parameter B/A is determined using a method based on the finite amplitude distortion of a sine wave emitted by a piston. The growth of the second harmonic component of this wave is measured by a piston receiver which is coaxial with and the same size as the source. In order to determine B/A, the experimental measurements are compared to a theory which incorporates the nonlinearity parameter. The theory developed for this study accounts for the influence of both diffraction and attenuation on the experimental measurements. For this reason, the method is more accurate than previous techniques that employ plane-wave theory for a lossless medium. To test the measurement method, experimental results for B/A in distilled water, ethylene glycol, and glycerol are compared to established values. The agreement between these values suggests that the measurement accuracy is ±4% for common liquids. (21 refs.)

71283 Theoretical investigation of the response of gas-filled micropores and cavitation nuclei to ultrasound. D.L.Miller, W.L.Nyborg (Dept. of Phys., Univ. of Vermont, Burlington, VT, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1537-44 (May 1983).
Theory is discussed for the transverse oscillation of a small circular interface set into a rigid baffle between gas and liquid. The angular resonance frequency is given by $(15\pi T/4\rho a^3)^{1/2}$, in which a is the radius of the interface, T is the interfacial surface tension, and ρ is the density of the liquid. Damping parameters are obtained for the radiation, viscous, and boundary-layer mechanisms of dissipation. This model system is extended for discussion of the pulsation of gas trapped in a pit or cavity in a solid, which may simulate one type of cavitation nucleus, and straight-through cylindrical holes or pores in a solid sheet, which is applicable to the hydrophobic membranes with gas-trapping micropores used in studies of biological effects produced by ultrasound. Fixed and free conditions at the three-phase line at the periphery of an interface are considered. Finally, the partially gas-filled cavity is treated, and also the partially gas-filled pore with two interfaces which have different mass, stiffness, and damping parameters. The results of these theoretical considerations are expected to be of value for quantitatively evaluating that specific form of stable cavitation which involves the direct activation of pre-existing, stable bodies of gas into ultrasonic pulsation, as experimentally observed, for example, by D. Miller, ibid., vol.71, p.471-476 (1982). (30 refs.)

71284 Turbulence effects on acoustic wave propagation over a smooth surface. S.F.Clifford, R.J.Lataitis (NOAA/ERL/Wave Propagation Lab., Boulder, CO, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1545-50 (May 1983).
A rigorous, mathematical treatment describing refractive turbulence effects on the mean-square pressure $\bar{p}^2$ of an isotropic acoustic source radiating above a smooth boundary is presented. The result is energy conserving, is general enough to allow the insertion of an arbitrary refractive-index correlation function, and does not require the ad hoc introduction of arbitrary parameters. This result is compared and contrasted with earlier work by other authors. (12 refs.)

71285 Self-action and stimulated scattering effects of sound beams in absorbing liquids—thermal self-focusing. F.V.Bunkin, K.T.Volyak, G.A.Lyakov (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.2, p.316-21 (Aug. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.2, p.575-84 (Aug. 1982). [received: May 1983]
The mechanisms of self-action of intense sound in viscous homogeneous liquids are described and estimated theoretically. It is shown that dissipative mechanisms are predominant for a broad class of liquids. These mechanisms involve viscous heating and the excitation of 'acoustic streaming' whose velocity clearly renormalizes the effective temperature. A number is introduced that distinguishes this class (the thermal analog of the acoustic Mach number). The threshold energy values and the spatial scales of the thermal self-focusing of the sound pulses are calculated. The conditions are found under which the self-action process is more rapid than shock wave formation. (23 refs.)

71286 Multiple scattering with applications to fish-echo processing. T.K.Stanton (Marine Studies Center, Univ. of Wisconsin, Madison, WI, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1164-9 (April 1983).
A general expression has been derived and evaluated for the backscattered echo energy of an acoustic pulse due to a collection of identical randomly distributed isotropic scatterers. Excess attenuation of the signal due to the extinction cross section of the scatterers as well as second-order scattering have been taken into account. Special attention is focused toward the numerical evaluation of second-order scattering effects. The expression is evaluated for three scattering geometries. It is shown in each geometry that when the absorption cross section of the scatterers is small, second-order scattering can be a factor in the backscattered energy. In this case, second-order scattering at least partially offsets effects due to excess attenuation in the low-to-moderate attenuation region. When applied to fish-echo processing, it was shown that in most cases the results represent an upper bound for the processed signal from a school of fish. The directional characteristics, acoustic frequency of the pulse in relation to the resonance frequency of the swimbladder (if any), and degree of randomness of the spatial distribution of the fish determine the degree to which second-order scattering plays a role in this area. (14 refs.)

71287 Coherent modes and boundary waves in a rough-walled acoustic waveguide. I.Tolstoy.
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1192-9 (April 1983).
The theory of Biot scatter was generalized to acoustically rough interfaces between fluids of differing densities and sound velocities by Tolstoy [J. Acoust. Soc. Am. 72, 960-972 (1982)] for the case $kh \leq 1$, k being the wavenumber and h the mean spacing between roughness elements. The present paper applies this approach to a harmonic point acoustic source in a fluid layer of thickness H and sound velocity c_1, with: (1) a rigid floor with hard pebbles and (2) a soft floor of sound velocity $c_2 \geq c_1$ (Pekeris waveguide) with a monolayer of hard pebbles at the interface. For a ratio $H/h = 10^2$ it is shown that: (a) pebbles have a marked influence on the usual coherent acoustic waveguide modes. This effect is best understood in terms of an alteration of the smooth-walled phase shift suffered by sound totally reflected from the bottom. This is particularly obvious for the Pekeris waveguide, for which the net effect on individual modes, for tightly packed spherical pebbles and for typical bottom acoustic parameters, is to increase their excitation amplitudes by factors approaching 2 near the limit of validity of the scatter theory ($kh = 1$). (b) Pebbles may bring about the existence of a subsonic branch of the lowest mode, corresponding to a wall roughness boundary mode carried by the rough boundary. In the hard-bottomed model this branch always exists for $k \geq (\varepsilon H)^{-1/2}$, where ε is a scattering parameter determined by the shape and volume per unit area of the scatterers. When combined with the criterion $kh \leq 1$ this condition yields a definite boundary wave passband. In the case of the Pekeris waveguide the passband is quite restrictive, being very sensitive to the ratio c_2/c_1; the boundary mode exists only for $c_2/c_1 \simeq 1+\delta$, where $\delta \lesssim 0.008$. For the special case $c_2 = c_1$ the boundary wave is strongest and allows for an entirely subsonic mode having no analog in the smooth-walled model. The c_2/c_1 restriction being fairly stringent one must expect the chief practical effect of this kind of bottom roughness to be of the type (a). (19 refs.)

71288 Measurement of fish target strength and associated directivity at high frequencies. P.H.Dahl, O.A.Mathisen (Fisheries Res. Inst., Univ. of Washington, Seattle, WA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1205-11 (April 1983).
A technique for measuring fish target strength and directivity in the yaw (coronal) plane is described. Measurements were made at 420 kHz on 40- to 60-cm-long salmonids, these are expressed through polar plots. Since fish-length-to-wavelength ratios generally were greater than 100, the estimated square root of backscattering cross section, or its equivalent peak envelope voltage, approaches a Rayleigh distribution. This was verified experimentally. Expressions for the expected value of target strength and its variance were derived. (13 refs.)

71289 An examination of the composite-roughness scattering model. S.T.McDaniel, A.D.Gorman (Appl. Res. Lab., Pennsylvania State Univ., State College, PA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1476-86 (May 1983).
A perturbation technique is applied to derive a composite-roughness theory for acoustic scattering from the sea surface. The leading term in the expansion obtained is the well-known result obtainable using ad hoc arguments. Higher order terms are evaluated to assess their contribution to the high-frequency monostatic backscattering strength of the sea. It is concluded that the leading term in the perturbation expansion provides an excellent approximation. (24 refs.)

71290 Modeling of long-range acoustic transmissions through cyclonic and anticyclonic eddies. S.Itzikowitz, M.J.Jacobson, W.L.Siegmann (Rensselaer Polytech. Inst., Troy, NY, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1556-66 (May 1983).
An approximate ray-acoustic model is used to obtain general information and overall results for long-range sound propagation through mesoscale cyclonic and anticyclonic eddies of arbitrary size and strength. Two-dimensional ray approximations are employed, and currents and horizontal sound-speed variations are averaged along approximate paths within an eddy. Eddy-induced per-ray travel-time changes are shown to depend nearly linearly on current strength and piecewise linearly on eddy size. For transmission ranges of about 1000 km, the presence of the eddy may cause per-ray travel time to increase (or decrease) by nearly 200 ms in the cyclonic (or anticyclonic) case. Variations in eddy current strength alone are shown to cause changes of about 100 ms in per-ray travel time. Currents may cause travel-time changes which are as much as those due to sound-speed variations close to eddy edge, and which are as much as 15% of sound-speed effects elsewhere. This suggests that in an acoustic tomography procedure, a corresponding percentage error in predicted sound-speed variations may arise by neglecting currents. In some total-field examples, it is shown that variations in eddy size and strength, and in source and receiver location, can cause an increase of about 5 dB or decrease of over 10 dB in transmission loss, relative to the case when the eddy is absent. Further, it is shown that explicit inclusion of currents alone may cause an increase or decrease of over 10 dB in transmission loss. (21 refs.)

71291 Normal mode identification for impedance boundary conditions. R.A.Koch, P.J.Vidmar, J.B.Lindberg (Appl. Res. Lab., Univ. of Texas, Austin, TX, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1567-70 (May 1983).
A prescription is presented for identifying normal modes calculated using the plane-wave reflection coefficient (impedance condition) to represent bottom interaction. The new prescription reduces to the usual equality between mode number and number of eigenfunction zeros for a fluid layer over a homogeneous fluid bottom. For a more complex bottom composition, the mode number also has a contribution given by the number of times that, as a function of horizontal wavenumber, the reflection coefficient circles the origin in the complex plane. (11 refs.)

71292 Ray calculations with beam displacement. C.T.Tindle (Phys. Dept., Univ. of Auckland, Auckland, New Zealand).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1581-6 (May 1983).
Ray theory with beam displacement is used to calculate the sound field in shallow water as a function of range. Results for the Pekeris model (1948) are compared with normal mode calculations and agreement is good even when the water depth is only a few wavelengths. The inclusion of beam displacement leads to the formation of ray caustics. Caustics are important at all ranges and occur even in isovelocity layers. Eventual failure of the ray method at short ranges and very low frequencies is traced to difficulties with the approximate evaluation of integrals by the method of stationary phase. (10 refs.)

71293 Ultrasonic signal distortion and its effects on velocity measurements in dispersive constant-group-velocity media. P.L.Edwards (Naval Surface Weapons Center, Silver Spring, MD, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1608-15 (May 1983).
Results are presented of calculations made of distortion experienced by ultrasonic pulses in transmission through dispersive constant-group-velocity media, and the effects that it may have on velocity measurements. Three types of pulses were considered: a pulsed sine wave of constant amplitude, a pulsed sine wave with amplitude varying as sine-squared, and a rectangular pulse. It is shown that the individual waves in the pulsed sine waves move with the phase velocity of a continuous wave, and the envelope moves with the group velocity. It was also found that a pulsed sine wave in going a certain distance in a constant-group-velocity medium repeats itself, and midway between these distances if the negative of the values at the repetition distances. Because of this repetition phenomenon it is seen that the pulses propagating through the constant-group-velocity dispersive media do not spread as is normally the case in dispersive media. The envelopes of the propagated waves were also calculated, and in agreement with Brillouin's results [Wave Propagation and Group Velocity (Academic, New York, 1960)] it was found that if the envelope contains negligible frequency components above the carrier frequency, then the envelope is not distorted in passing through a dispersive constant-group-velocity medium. 43.40 MECHANICAL VIBRATIONS AND SHOCK

(see also 46.30M Vibrations, aeroelasticity, hydroelasticity, mechanical waves and shocks)

71294 Statistical models in vibration analysis. H.G.Davies, M.A.Wahab, S.I.Khandoker (Dept. of Mech. Engng., Univ. of New Brunswick, Fredericton, New Brunswick, Canada).
Can. Acoust./Acoust. Can. (Canada), vol.11, no.2, p.37-44 (April 1983).
Statistical models are often used in the analysis of vibration levels of complicated dynamic structures, particularly at high frequencies when the high numbers of modes involved in the vibration make both the usual modal analysis and also numerical analysis unfeasible. Results from such models often compare favourably with experimental results. A particular simple coupled-beams structure is considered here. The vibration analysis is carried out within the framework of statistical energy analysis. In particular, results for the power flow from one beam to another are obtained. An ensemble of similar structures is constructed by varying the lengths of the beams. Exact values of the mean and standard deviation of the power flow are calculated for this ensemble. Approximate results from statistical models of the structure, including the statistical energy analysis result, are shown to compare very well with the exact results. (9 refs.)

71295 Doubly asymptotic approximations for vibration analysis of submerged structures. T.L.Geers, C.A.Felippa (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1152-9 (April 1983).
Doubly Asymptotic Approximations (DAAs) are differential equations for boundary-element analysis of the interaction between a complex structure and a surrounding infinite medium. In this paper, the use of first- and second-order DAAs for steady-state vibration analysis of submerged structures is examined. First, the governing discrete-element equations for the general problem are set down and discussed. Then the accuracy of three DAA forms is studied through the generation of numerical results for a submerged spherical shell. Although the first-order DAA is found to be inadequate, the two second-order forms show considerable promise. (23 refs.)

71296 Analysis of low frequency sound radiating from bridge by a travelling vehicle. T.Ohshima (Kitami Inst. of Technol., Kitami, Japan), S.G.Nomachi.
J. Acoust. Soc. Jpn. (Japan), vol.39, no.1, p.11-18 (Jan. 1983). In Japanese.
Test results on an actual bridge due to a moving truck are measured and analysed. The spectrum analyses of the acceleration wave of the bridge vibration and the sound radiating from its surface are done and they are in a good agreement of the peak frequencies to each other. Dynamic response analysis of the bridge forced by a travelling vehicle, is handled by means of the folded plate theory, and lastly the SPL of the low frequency range is formulated from the particle velocity equation corresponding to bridge and moving vehicle system. The envelope curve of the peak of theoretical SPL values may have a good agreement to the experimental ones. In the numerical calculation, the power spectrum density of the sound and the distributions of the sound in the crosswise direction of the bridge, truss bridge and box girder bridge, are obtained. The power spectrum density of the sound obtained by the effective elementary beam theory are compared with the one given by the folded plate theory and they have a good agreement in the low frequency range. (10 refs.)

71297 Measurement of vibration velocity distributions in disks of Pb(zr.Ti)O$_3$ using optical heterodyne technique. S.Sakuma, S.Ueha, E.Mori (Res. Lab. of Precision Machinery & Electronics, Tokyo Inst. of Technol., Yokohama, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.1, p.45-51 (Jan. 1983). In Japanese.
By using an optical heterodyne technique, vertical vibration velocity distributions along the radial direction in disk or bevelled disk transducers of Pb(Zr.Ti)O$_3$ are successfully measured together with their relative vibration phases referring to the applied driving signals. They are essential to calculate their volume velocity or directional patterns. The experiment is carried out changing the diameter to thickness ratio from 2 to 12. Their frequency spectra (frequency range: 1-700 kHz) are also measured to be compared with the vibration velocity distributions. The velocity distribution and frequency spectra show that two groups of radial vibration coupling with the thickness extensional vibration obviously exist in disk vibrations. These two groups are analytically confirmed by finding out the corresponding boundary conditions. The relations among the diameter to thickness ratio, frequency spectra and vibration modes of disk-type piezoelectric ceramic transducers are clarified. (13 refs.)

43.45 STATISTICAL STUDIES OF ACOUSTICAL RESPONSE

(see also 43.55 Architectural acoustics)

71298 Progressive phase trends in multi-degree-of-freedom systems. R.H.Lyon (Dept. of Mech. Engng., MIT, Cambridge, MA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1223-8 (April 1983).
The relative phase of the response of a dynamical system to its excitation has been largely ignored in problems dealing with noise response of such systems. This is because mean-square amplitude functions are able to predict many of the quantities that one is interested in such as crack growth, noise radiation, and clearance impact probabilities without concern for phase. But phase has an essential role in other cases, such as phase coherence of vibration fields, or the design of filters to 'dereverberate' a received signal. This paper describes some early results of the analysis of phase response of multi-degree-of-freedom systems, using ideas that are closely related to statistical energy analysis, until now, used exclusively for the kinds of problems listed above that tend to ignore phase. The present results show good agreement between simple theory and experiments, but more importantly, they suggest directions for further work that should have significant payoff in the future. (3 refs.)

43.50 NOISE, ITS EFFECTS AND CONTROL

(see also 86.70J Environmental science)

71299 Investigations on acoustic mufflers. W.K.Sa'id (School of Control & Systems Engng., Univ. of Technol., Baghada, Iraq), B.C.Nakra, A.Nassir.
J. Acoust. Soc. India, vol.9, no.2, p.68-74 (April 1981). [received: March 1983]
Various types of basic mufflers and their combinations were investigated both experimentally and theoretically to predict their noise attenuation characteristics. The basic muffler types include the simple expansion, resonator, backflow and absorption. Both parallel and series combinations of these mufflers were also investigated. A test rig was made for the purpose of this investigation where a loudspeaker driven by an oscillator was used as the noise source. In general good agreement was found between the theoretical and experimental results. The results showed that the combination type mufflers are potentially good for high noise attenuation in applications like internal combustion engines, etc. (7 refs.)

71300 Noise source identification—acoustic intensity technique. J.J.Kowelewski (Ontario Hydro Res. Div., Toronto, Canada).
Can. Acoust./Acoust. Can. (Canada), vol.11, no.2, p.25-36 (April 1983).
The determination of the sound power of audible noises and their location are usually complicated by room effects, high ambient conditions and frequently the presence of other sources. The two-microphone acoustic intensity approach was found to be a promising technique for analyzing sources of noise where conventional methods are not particularly practical. A procedure is described for measuring directly acoustic intensity levels using a simple 'calibrator' and commercial available dual channel analyzer. (12 refs.)

71301 An analysis of community complaints to noise. G.A.Luz, R.Raspet, P.D.Schomer (US Army Construction Engng. Res. Lab., Champaign, IL, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1229-35 (April 1983).
Noise complaints received Army-wide for a one-year period were analyzed (a) to determine the relationship between the nature of the complaint and the type of noise and (b) to determine the relationship between complaints and the day-night level (DNL). For blast noise, 77% of complaints mentioned vibration or physical damage or both, thus confirming the validity of the C-weighted DNL as a better measure of blast noise than the A-weighted DNL. The relationship between DNL and complaints, however, was a very weak one. Instead, the data confirmed an independent finding of a recent study of Air Force noise complaints—that complaints are generated by unusual rather than typical noise levels. Since a valid measure of community response to noise should be functionally relatable to the noise dose, complaints do not appear to be a good measure of the community response. To deal with the wide variability in the emotional tone of the complaints a psychological model was developed and tested. The implications of this model for how an airport or Army base should deal with complaints are discussed. (20 refs.)

43.55 ARCHITECTURAL ACOUSTICS

71302 Designing audio for video. V.Gizzi.
DB Sound Eng. Mag. (USA), vol.17, no.3, p.44-9 (March 1983).
Describes the design of a sound mixing facility for Editel New York. The shortcomings of the proces of mixing sound for video is discussed. The structural and acoustical design of the audio mix room is also included. (no refs.)

71303 Assessment of significant acoustic parameters for rating sound insulation of party walls. J.-P.Vian (Centre Sci. et Tech. du Batiment, Grenoble, France), W.F.Danner, J.W.Bauer.
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1236-43 (April 1983).
To test the adequacy of French regulations for sound isolation in buildings, subjects were asked to rate their annoyance with samples of music filtered by electronic 'insulation curves' representing different party walls. The insulation curves differed in their shape but all provided an A-weighted level difference at 51 dB with a pink noise source, measured over a 1/3-octave bandwidth of 40 Hz-10 kHz. However, the different insulation curves did not provide the same degree of sound isolation with various music samples due to source spectral differences. A statistically significant correlation was observed between annoyance and the A-weighted level difference ratings of the insulation curves when bandlimited pink noise (125 Hz-4 kHz) was used as a source. This correlation was not present when broadband (40 Hz-10 kHz) pink noise was used for the performance rating. Subjects showed a preference for insulation curves with steeper slopes (9 and 12 dB/oct), thus preferring a greater relative attenuation at higher frequencies. Additionally, the presence of coincidence dips was found to have an effect on subject preference that appeared to depend upon both the frequency range at which they occurred and the slope. The bandwidth of the music signals and the intelligibility of speech in the intruding sounds were also found to influence the annoyance ratings. These results indicate that the level difference method for rating sound insulation could better predict occupant response if the above results were accounted for in the procedure. (18 refs.)

71304 Comments on 'Sound radiation from building elements' [and reply]. P.A.A.Laura (Inst. of Appl. Mech., Puerto Belgrano Naval Base, Argentina), Y.Shen, D.J.Oldham.
J. Sound & Vib. (GB), vol.88, no.1, p.143-4 (8 May 1983).
Laura congratulates Shen and Oldham on their work (see ibid., vol.84, p.11, 1981), stating that agreement between predicted and measured radiation patterns would improve considerably if the Mindlin-Timoshenko thick plate equations were used. It may also be important to consider the effect of rotational flexibility coefficients at the plate edges, using polynomial coordinate functions to represent the plate response. In reply, Shen and Oldham accept that Laura has made some valid points, but state that the difficulty is in specifying the parameters. (6 refs.)

43.60 ACOUSTIC SIGNAL PROCESSING

71305 Processing of the acoustic wave image. M.A.Drzewiecka, M.Sztustakowski.
Arch. Acoust. (Poland), vol.7, no.1, p.29-41 (1982).
Presents investigations of a system for processing the image of acoustic waves generated in transparent media. It also gives an analysis of the system and discusses the influence of parameters of spatial filter apertures and of the acoustic field on the quality of representation of the field intensity distribution. (19 refs.)

71306 Growth of forward masking for sinusoidal and noise maskers as a function of signal delay; implications for suppression in noise. B.C.J.Moore, B.R.Glasberg (Dept. of Experimental Psychology, Univ. of Cambridge, Cambridge, England).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1249-59 (April 1983).
The first two experiments were designed to determine whether mutual suppression in broadband noise increases in strength with increasing overall level. In experiment I masking functions (signal threshold versus masker level) were measured in forward masking as a function of the delay time of a 10-ms signal, both for a broadband noise masker (low-pass filtered at 8 kHz) and for sinusoidal maskers at 1, 2, and 4 kHz. In the latter case the signal frequency equaled the masker frequency. For short signal delays the masking functions were steeper for the sinusoidal masker than for the noise masker. At longer delays the slopes for both masker types decreased and the slopes for the two masker types became more nearly equal. In experiment II the authors investigated the effect of gating a low-level noise cue with the sinusoidal masker. At the longer signal delays the masking functions had equal slopes for the broadband noise masker and the sinusoidal masker with cue. At short signal delays the masking functions for sinusoidal maskers may be artificially' steepened, since the subject lacks an effective cue to distinguish the signal from the masker. The equal slopes at longer delays indicate that mutual suppression of the components within a broadband noise does not increase in strength with increasing overall level. In experiment III they attempted to estimate the magnitude of mutual suppression in a broadband noise by comparing masking functions for a broadband noise and for a noise whose bandwidth was 20% of the center frequency. The suppression was estimated to be about 2 dB at 4 kHz and 8 dB at 2 kHz. A simple mathematical expression, suggested by Jesteadt et al. [J. Acoust. Soc. Am. 71, 950-962 (1982)], was found to give an accurate description of the amount of masking produced by the broadband masker as a function of masker level and signal delay. (29 refs.)

71307 Detection performance characteristics for a system with quantizers, OR-ing, and accumulator. A.H.Nuttall (Naval Underwater Systems Center, New London, CT, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1631-42 (May 1983).
The false alarm and detection probabilities of an N-channel system subject to $L+1$ level quantization, OR-ing, and accumulation of M time samples, are evaluated exactly, with no Gaussian assumptions, for arbitrary values of N, L, M, and for a quantizer with arbitrary breakpoint locations. The channel noises are independent but can have arbitrary statistics. The signal occupies one unknown (possibly changing) channel, if present. Two FFTs suffice to sweep out a complete detection probability versus threshold curve. The optimum placement of quantizer breakpoints, for a fixed total number of levels, $L+1$, is a subtle one and shown to depend on N, M, and the desired level of performance; a simple rule-of-thumb is presented which yields near-optimum capability over the useful range of the operating characteristics. (10 refs.)

71308 Optimizing the performance of a quantizer. W.A.Struzinski (Naval Underwater Systems Center, New London, CT, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1643-7 (May 1983).
In a previous paper [W.A. Struzinski, IEEE Trans. Acoust., Speech, Signal Process., vol. ASSP-30 (4), p.668-671 (1982)], a mathematical model was developed to compute the ORing loss for a system composed of quantizers followed by an ORing device and an accumulator. The quantizer investigated was an eight level (3-bit) device spanning from the noise-only mean, m_0 to $m_0+2\sigma$. The subject paper examines different spans for the same 3-bit quantizer to determine the spin that yields the optimal performance. It is determined that the optimal performance is obtained when the quantizer spans the range m_0 to $m_0+3\sigma$. The ORing loss and the input signal-to-noise ratio requirements for the ORing device are computed for this quantizer. Then, these results are compared with those for the quantizer spanning the range m_0 to $m_0+2\sigma$. based on this comparison, it is concluded that the performance difference increases with a decrease in the false alarm probability and the number of samples in the accumulator and with an increase in the number of channels ORed. (3 refs.)

71309 Signal detection and localization using the Fourier series method (FSM) and cross-sensor data. J.H.Wilson (Ocean Acoustics Div., Sci. Applications Inc., McLean, VA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1648-56 (May 1983).
A significant amount of acoustic information that is available in the individual hydrophone or cross-sensor measurements of line array systems may be irrevocably lost in the conventional beamforming (CBF) process. The Fourier series method (FSM) solution is presented for individual hydrophone pairs or cross-sensor measurements and compared to the CBF output for simulated deterministic acoustic fields consisting of signals embedded in directional noise background. By using the acoustic information lost in CBF, potentially significant improvements in the detection and localization of signals by using FSM. For near-broadside design frequency conditions, FSM gives significant peak signal to background noise enhancement over CBF for a 64-element equally space line array. FSM can also resolve two signals in azimuth separated by less than a conventional beamwidth. These array performance improvements result from the accurate estimation of the high order spatial Fourier coefficients of the acoustic field. It is emphasized that FSM requires no a priori assumptions about the unknown acoustic fields required by adaptive beamforming methods and the FSM solution has no mathematical ill conditioning associated with many of the inverse beamforming methods. (41 refs.)

71310 A method for separating progressive and retrogressive spatial sound waves in real time by a correlation method. K.Kuroiwa (Faculty of Engng., Ohita Univ., Ohita, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.1, p.36-44 (Jan. 1983). In Japanese.
Describes a method for separating in real time each of progressive and retrogressive spatial sound waves directly from the reflective sound field by using a correlation method. A spatial sound wave implies a spatially distributed sound pressure oscillation, that is a sound wave group which travels backward and forward between the sound source and the reflector as time elapses. It can be equivalently expressed and measured in the form of a correlation function obtained from the sound source and receiver signals in the case of scanning the receiver position and fixing time delay. In order to realize the real time separation, the simultaneous scanning both of time delay and receiver position is proposed. Each of progressive and retrogressive spatial sound waves is extracted by scanning time delay with positive and negative time delay ratio respectively, together with scanning receiver positive and negative time delay ratio respectively, together with scanning receiver position with constant moving velocity. Their travelling distances are proportional to the initial time delay. Some exeriments based on the theory are carried out. Then, considering the sound waves' travelling distance and direction, and their attenuation by distance and wavelength, it is shown that the theory and procedure of the method for separating is valid. (12 refs.)

43.70 SPEECH COMMUNICATION

(inc. speech perception, speech intelligibility, and speech synthesis; see also 87.36 Speech)

71311 Laryngeal vibrations: a comparison between high-speed filming and glottographic techniques. T.Baer, A.Lofqvist, N.S.McGarr (Haskins Labs., New Haven, CT, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1304-8 (April 1983).
This study was designed to compare information on laryngeal vibrations obtained by high-speed filming, photoglottography (PGG), and electroglottography (EGG). Simultaneous glottographic signals and high-speed films were obtained from two subjects producing steady phonation. Measurements of glottal width were made at three points along the glottis in the anterior-posterior dimension and aligned with the other records. Results indicate that PGG and film measurements give essentially the same information for peak glottal opening and glottal closure. The EGG signal appears to reliably indicate vocal-fold contact. Together, PGG and EGG may provide much of the information obtained from high-speed filming as well as potentially detect horizontal phase differences during opening and closing. (18 refs.)

71312 Reiterant speech: an acoustic and perceptual validation. L.S.Larkey (Res. Lab. of Electronics, MIT, Cambridge, MA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1337-45 (April 1983).
Reiterant speech, or nonsense syllable mimicry, has been proposed as a way to study prosody, particularly syllable and word durations, unconfounded by segmental influences. Researchers have shown that segmental influences on durations can be neutralized in reiterant speech. If it is to be a useful tool in the study of prosody, it must also be shown that reiterant speech preserves the suprasegmental duration and intonation differences relevant to perception. In the present study, syllable durations for nonreiterant and reiterant ambiguous sentences were measured to seek evidence of the duration differences which can enable listeners to resolve surface structure ambiguities in nonreiterant speech. These duration patterns were found in both nonreiterant and reiterant speech. A perceptual study tested listeners' perception of these ambiguous sentences as spoken by four 'good' speakers—speakers who neutralized intrinsic duration differences and whose sentences were independently rated by skilled listeners as good imitations of normal speech. The listeners were able to choose the correct interpretation when the ambiguous sentences were in reiterant form as well as they did when the sentences were spoken normally. These resutls support the notion that reiterant speech is like nonreiterant speech in aspects which are important in the study of prosody. (22 refs.)

71313 Place cues for nasal consonants with special reference to Catalan. D.Recasens (Dept. of Linguistics, Univ. of Connecticut, Storrs, CT, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1346-53 (April 1983).
This study investigates the perceptual contributions of formant transitions and nasal murmurs to the identification of the unreleased Catalan nasal consonants [n], $[n_p]$, and $[n_v]$ (alveolar, palatal, velar, respectively) after [a] in absolute final position. Transition and murmur patterns were synthesized and varied simultaneously and systematically by interpolating between optimal values obtained from spectrographic analysis of natural speech. Catalan subjects were asked to identify the synthetic stimuli as [n], $[n_p]$, and $[n_v]$. The main findings were: (1) Although transitions provided more effective cues for place for articulation than murmurs, the murmurs did not make a significant contribution to the $[n_v]$-[n] distinction. (2) The cue value of the transitions ($[n_v]>[n]$, [n]) was inversely related to that of the murmurs ($[n_v]$, $[n]>[n_p]$). It is concluded that static and dynamic place cues for nasals in an [aC sharp] context are perceptually integrated with reference to the typical pattern of production of these consonants. (33 refs.)

71314 Statistical audio signal parameters and their significance for speech and music recognition. K.Schulze (Hochschule der Bundeswehr, Hamburg, Germany).
NTG-Fachber. (Germany), vol.83, p.263-72 (1983). In German. (Horrundfunk 6 (Sound Broadcasting), Mannheim, Germany, 23-25 Nov. 1982).
Weibull distribution which can serve for music and speech modelling is explained. The music-speech switch of Belger and Jakubowski, based on the evaluation of exponential decay of sound signal, should be supported by amplitude statistics. Components of sound and simulated signals are discussed, and the conclusion is that Weibull parameter α is a criterion for the speech-music recognition. (13 refs.) *J.M.S.*

43.75 MUSIC AND MUSICAL INSTRUMENTS

71315 Tolerance of intonation deviation in melodic intervals in listeners of different musical training. J.Fyk (Pedagogical Univ., Krakow, Poland).
Arch. Acoust. (Poland), vol.7, no.1, p.13-27 (1982).
The aim of the present experimental paper was to investigate the tolerance of intonation deviations in musical intervals, depending on listeners' musical training. The investigations covered the perception of intonation deviations of chosen melodic intervals in isolation and in melodic context. Tests were edited from music material recorded on magnetic tape and were exposed by a loudspeaker to groups of 8-12 persons. The results obtained confirmed a dominating effect of musical training on the tolerance of intonation deviations in isolated intervals and those in melodic context. It was found out that in a musically trained group the tolerance of intonation deviations in intervals in melodic context was influenced by functional tendency and by the direction of intervals in a musically untrained group. (27 refs.)

71316 Electronic organ: IC sounds. I. H.Hintz, H.Struwe.
Funkschau (Germany), no.8, p.89-92 (15 April 1983). In German.
After an introduction to the fundamentals of an electronic organ, the DIY design of a single-manual instrument is described in detail, supported by circuit diagrams of the master oscillator of 4.331 MHz, the vibrato generator of 6 Hz, the sustain network, the volume and balance controls, and a typical active filter. Complete circuit diagrams of the organ and of the special IC type TDA 1008 containing the 5-octave frequency divider are given. (no refs.) *A.L.*

71317 Longitudinal vibrations in violin strings. A.R.Lee, M.P.Rafferty (Phys. Dept., Univ. Coll., Cardiff, Wales).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1361-5 (April 1983).
The authors report the observation of longitudinal vibrations in violin strings excited by bowing. These vibrations are detected from the rocking motion of the top of the bridge in the direction longitudinal to the strings, with the aid of a photoelectric device. The frequencies of these waves are approximately three octaves above the respective fundamental frequencies of the transverse string vibrations, in line with expectation. It is found that stable oscillations are difficult to sustain in which both the transverse and longitudinal motions can coexist in comparable strength. Essentially pure longitudinal oscillations can be excited by bowing at a forward angle. These modes are difficult to identify in the normal bowing spectrum, and are substantially absent in pizzicato tones, except in the initial transients. (6 refs.)

43.85 ACOUSTICAL MEASUREMENTS AND INSTRUMENTATION

(for acoustic noise measurement, see also 43.50; for photoacoustic spectroscopy, see 07.65)

71318 High resolution acoustic microscopy in superfluid helium. J.S.Foster, D.Rugar (Edward J. Ginzton Lab., Stanford Univ., Stanford, CA, USA).
Appl. Phys. Lett. (USA), vol.42, no.10, p.869-71 (15 May 1983).
An acoustic microscope has been developed which utilizes liquid helium at temperatures less than 0.2K as the coupling medium. At the operating frequency of 4.2 GHz, the acoustic attenuation of the helium is negligible and the acoustic wavelength is 570 Å. Micrographs of a silicon integrated circuit are presented which demonstrate the good signal-to-noise ratio of the imaging and resolution better than 500 Å. (10 refs.)

71319 Automated digital benchtop calibration system for hydrophone arrays. L.Dwight Luker, J.F.Zalesak, C.K.Brown, R.E.Scott,Jr. (Underwater Sound Reference Detachment, Naval Res. Lab., Orlando, FL, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1212-16 (April 1983).
A calibration system is described which can measure the complex sensitivity and directivity patterns of hydrophone arrays, such as sonobuoy arrays, in which the hydrophone elements are individually accessible. These arrays are often deployed over a great distance in the ocean. Calibrating them under free-field conditions would be an extremely difficult task. The system described here allows for their calibration on a benchtop. The entire calibration system is controlled by a computer and requires minimal operator intervention. The computer algorithm is also applicable to hydrophone arrays which do not have individually accessible elements. Results are presented which compare measured directivity patterns with theoretical directivity patterns calculated from the measured complex sensitivities of the individual array elements. (5 refs.)

71320 Improved resonance technique for materials characterization. W.M.Madigosky, G.F.Lee (Naval Surface Weapons Center, White Oak, Silver Spring, MD, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1374-7 (April 1983).
An improved resonance apparatus for materials characterization is described. The apparatus accurately determines the propagation constants of an extensional acoustic wave by exciting a bar of material at one end with a noise source, while the other end is allowed to move freely. Miniature accelerometers measure the acceleration at two locations and their output signals are analyzed by a dual channel FFT spectrum analyzer. At certain frequencies, the acceleration ratio goes through resonant peaks whose amplitudes and frequencies are related to the Young's moduli and loss factors of the material. The apparatus is capable of measuring the acceleration ratio over a frequency range of 25 Hz to 20 kHz. As illustrations of the technique, Young's modulus and loss factor were determined on a viscoelastic material; polyurethane (over a temperature range −13.4° to 81°C) and on two metal matrix composite materials: a silicon carbide-aluminum and a graphite-aluminum. The apparatus was found to be a fast and reliable method to determine dynamic constants. (9 refs.)

71321 An ultrasonic bridge for the study of viscoelastic properties of thin interface films. S.I.Rokhlin (Dept. of Materials Engng., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1619-23 (May 1983).
The method of elastic interface waves which is currently under development has proven effective in the investigation of viscoelastic properties of interfaces in solid bodies. The present paper is concerned with the development of a modified method of measurement, employing ultrasonic interface waves, which makes it possible to investigate the thermomechanical properties of thin interface layers. The effect of temperature variations in the substrates and transducers is eliminated by using a differential acoustic system. Comb transducers are used for excitation and reception of ultrasonic waves. (8 refs.)

71322 A method for displaying the vector of the sound pressure complex reflection coefficient in real time by a correlation method. K.Kuroiwa (Faculty of Engng., Ohita Univ., Ohita, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.1, p.19-29 (Jan. 1983). In Japanese.
Describes a method for displaying the sound pressure complex reflection coefficient Γ of an acoustic panel as a vector directly on a cathode-ray tube in real time by using a correlation technique, and its application to a direct view type measurement of the acoustic properties such as sound absorption coefficient α, acoustic resistance R, acoustic reactance X, and absolute value $|\Gamma|$ and phase ϕ of Γ. In this method, a cross correlation function between source and receiver signals through a narrow band-pass filter which becomes equivalently a sinusoidal sound wave of time delay is used. A vector of Γ is displayed in real time by extracting the real part $|\Gamma|\cos\Phi$ and the imaginary part $|\Gamma|\sin\phi$ of Γ directly from the compound sound wave close to the acoustic panel measured by a correlator using a M-sequence signal and by feeding these two analog values to the vertical and horizontal terminals of the cathode-ray tube. Therefore, it is possible to read each of the acoustic properties (complex reflection coefficient chart, sound absorption coefficient chart, sound absorption coefficient chart and Smith chart) from the vector. Experiments in the case of the normal incidence are carried out. Comparing with the standing wave method, the validity of this method is shown. (12 refs.)

71323 Noise sources detection system based on the propagation law of mutual intensity. K.Arai, S.Araki, T.Shiogai, K.Hayashi (Kanazawa Univ., Kanazawa, Japan).
Mem. Fac. Technol. Kanazawa Univ. (Japan), vol.15, no.2, p.131-8 (Nov. 1982). In Japanese.
An imaging system for mechanical noise sources, based on the propagation law of mutual intensity, was constructed. In order to control the system and reconstruct images, a microcomputer was used. To record the mutual intensity in low degree of temporal coherency, the correlator consisted of two multipliers, two integrators, and a $\pi/2$ phase shifter was introduced. The intensity distribution of an actual noise source was reconstructed at several frequencies, including the case of low power spectrum intensity in addition to the peak power frequency. This system allowed the authors to investigate the spatial distribution of noise sources and its frequency dependence. (6 refs.)

71324 The acoustic microscope. J.Attal (Centre of Electronic Studies of Solids, Montpellier, France).
Recherche (France), vol.14, no.144, p.664-7 (May 1983). In French.
Whilst thoughts have for a long time been directed to the use of sound waves for examining materials it was not until the 1960s that this was first achieved. There are now several examples. The paper describes the place of the acoustic microscope in science, and its capabilities. The general principles of operation of these instruments are given, including the conversion of high frequency sound waves to electrical signals using a small zinc oxide piezoelectric crystal. Some typical photographs are given, together with one of a typical acoustic microscope, and there is a diagram of the sound conversion system. Uses for examining micro-components are described and a description follows of the uses of these instruments for microscopic work. (6 refs.) *G.V.D.*

71325 New methods of determination of emitted acoustic energy. II. Determination of the sound power from measurement of the sound intensity; phase-gradient method. I.Veit (Fraunhofer- Inst. fur Bauphys., Stuttgart, Germany).
Tech. Mess. tm (Germany), vol.50, no.4, p.151-4 (April 1983). In German.
For pt.I see ibid., no.3, p.87-92 (1983). The method of determination of acoustic energy is based on the evaluation of the acoustic intensity; a method based on the relationship of the acoustic intensity and the spectral densities of two sound pressures, which could be measured by means of two microphones placed close to each other is first described. An alternative method of determining the acoustic intensity by measuring the phase gradients of sound pressures in the sound field using only a single microphone is then presented. The two methods are described and discussed in detail and layouts of the suggested equipment are given. A comparison of the two methods is made and their relative merits are pointed out. 43.88 TRANSDUCTION; DEVICES FOR THE GENERATION AND REPRODUCTION OF SOUND

71326 Method of fastening piezoelectric element by 'cold soldering'. Yu.I.Kuzovkov, V.Ya.Nagin (Kiev State Univ., Kiev, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.2, p.1035-6 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.230-1 (July-Aug. 1982). [received: May 1983]
A galvanoplastic method is described for fastening resonant acoustic disk transducers for the range 10^2-10^5 kHz. The method has been developed in connection with the construction of a cell for studying the velocity of propagation and the absorption coefficient of ultrasound in dielectric liquids in the frequency range 1-100 MHz at a pressure of up to 100 MPa. It is based on the technology of 'cold soldering' of copper, used in galvanoplasty. (2 refs.)

71327 Variational analysis of a model for a piezoelectric polymer flexural plate hydrophone. P.A.A.Laura (Inst. of Appl. Mech., Puerto Belgrano Naval Base, Argentina), D.Avalos.
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1378-83 (April 1983).
An approximate solution for the mathematical model of the piezoelectric polymer flexural plate hydrophone is presented. The case where sheets of polymer are attached to air-backed rectangular flexural plates is treated. This study constitutes an extension of Ricketts' recent treatment (1981) in the sense that (a) dynamic effects are now taken into account and (b) simply supported, clamped, or elastically restrained edges are now considered. (4 refs.)

71328 The audio spotlight: an application of nonlinear interaction of sound waves to a new type of loudspeaker design. M.Yoneyama, J.-I.Fujimoto (Application Products Dept., Ricoh Co. Ltd., Tokyo, Japan), Y.Kawamo, S.Sasabe.
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1532-6 (May 1983).
This work was done to devise a new type of loudspeaker. The theory for sound reproduction of this loudspeaker is based on nonlinear acoustics of sound wave interaction in air. A finite amplitude ultrasound wave that can be amplitude modulated by any audio signal is radiated from a transducer array into air as the primary wave. As a result, an audio signal is produced in the air because of the self-demodulation effect of the AM sound wave due to the nonlinearity of the air. It is possible to get a flat characteristic of reproduced sound pressure by using an equalizer. In some fundamental experiments the characteristic of the reproduced sound pressure is not quite flat due to an imperfect transducer array. Improvement of the transducer makes it possible to get a flat characteristic. A special feature of this loudspeaker is its very sharp directivity pattern, which makes it possible to realize a sound spotlight. (6 refs.)

71329 Ultrasound probes. A.Fukumoto, T.Yano, M.Kawabuchi (Matsushita Res. Inst. Tokyo Inc., Tokyo, Japan).
Natl. Tech. Rep. (Japan), vol.29, no.1, p.176-87 (Feb. 1983). In Japanese.
Technologies of ultrasound probes for non-invasive testing instruments are summarized. Basic constructions and functions of ultrasound probes are described from the stand point that the probes are 'electrical' as well as 'acoustical and vibrational' components. Design methods of ultrasound probes are described starting from transducer elements, arrays and electronic circuits connected to the probes. Probe materials developed by the authors are then described. These materials include piezoelectric ceramics, acoustical matching materials and electronic switches used for element selection. Finally, examples of ultrasound probes developed by the authors are described. They are linear, sector, trapezoidal and two-dimensional scanning ultrasound probes for diagnostic ultrasound instruments. Also, as a unique example of the application of ultrasound probe technologies, a delay line transducer used for sector scanning diagnostic ultrasound instruments is explained. (34 refs.)

44.10 HEAT CONDUCTION (MODELS, PHENOMENOLOGICAL DESCRIPTION)

71330 Reduced numerical integration in thermal transient finite element analysis. D.R.J.Owen (Dept. of Civil Engng., Univ. of Wales, Swansea, Wales), F.Damjanic.
Comput. & Struct. (GB), vol.17, no.2, p.261-76 (1983).
The stability and accuracy of the so-called 'α-family', two level time integration algorithms for thermal transient problems are considered. In particular, the influence on the solution characteristics of the order of numerical integration rule employed in the evaluation of the element matrices is examined. Consideration is restricted to the four node bilinear and eight node biquadratic isoparametric elements. (18 refs.)

71331 Heat propagation on a shaft due to transient torsional vibration. S.Panteliou (School of Engng., Univ. of Patras, Patras, Greece), A.D.Dimarogonas.
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.2, p.111-22 (March-April 1983).
During transient torsional vibration of rotating shafts, heat is generated due to material damping, which results in substantial temperatures. The problem of a cylinder of infinite length heated by way of a transient torsional vibration of variable amplitude is investigated and an expression of the maximum surface temperature is obtained. Diagrams with the appropriate dimensionless parameters are presented together with a numerical example. It is shown that substantial temperatures can be developed as a result of this mechanism of heat generation. This quantifies the belief that this phenomenon was the reason for a major generator failure in a power system. (13 refs.)

71332 Heat conductivity in a spherical heat-emitter with an arbitrarily-varying heat transfer coefficient. G.I.Bogomolov.
Izv. VUZ Mashinostr. (USSR), no.3, p.55-8 (1983). In Russian.
Discusses the steady-state heat conductivity in a spherical heat-emitting element with a single cover, under conditions of unchanging law of the heat transfer coefficient from the element to a heat conductor. This law is expressed by a trigonometric cosine polynomial. The temperature distributions in the cover and in the core are described by a series of Legendre polynomials, with the coefficients meeting the requirements of the Laplace equation in the cover and the Poisson equation in the core, for the corresponding boundary conditions. 71333 Finite difference calculations of buoyant convection in an enclosure. I. The basic algorithm. H.R.Baum (Center for Fire Res., NBS, Washington, DC, USA), R.G.Rehm, P.D.Barnett, D.M.Corley.
SIAM J. Sci. & Stat. Comput. (USA), vol.4, no.1, p.117-35 (March 1983).
A novel mathematical model of buoyant convection in an enclosure (see R.G. Rehm and H.R. Baum, NBS J. Res., vol.83, p.297-308, 1978) is solved by finite difference techniques in the two-dimensional case. This model has been developed as a principal analytical tool for the prediction of the movement of smoke and hot gases in fires. Effects of large density variations caused by substantial heating are retained while acoustic (high-frequency) waves, which are unimportant to buoyant convection, are analytically filtered out. No viscous or thermal conduction effects are included in the model. The computational procedure uses a software package for solving a nonseparable elliptic equation developed especially for this problem. The computer model has been used to compute the buoyant convection produced in an enclosure by a spatially distributed heat source simulating a fire. (22 refs.)

44.30 HEAT TRANSFER IN INHOMOGENEOUS MEDIA AND THROUGH INTERFACES

71334 Solution of synthesis problems for heat-exchange systems. I.I.Golovach.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.3, p.64-7 (1983). In Ukrainian.
A mathematical model of heat-exchange systems (HES) is constructed on the basis of which the problem of HES synthesis is reduced to a discrete problem of optimum control. A method for the solution of this problem is developed. (3 refs.)

71335 Determination of the temperature field in a granular layer. V.I.Kushch, O.G.Artemenko.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.3, p.74-7 (1983). In Ukrainian.
An exact solution is given for the problem of heat flow passing through a layer containing spherical grains with centres in several parallel planes. In each plane the grain centres form an orthogonal lattice. The temperature values on the lower surface and the effective thermal conductivity are calculated; two diagrams are presented. (2 refs.)

71336 Heat exchange in gas furnaces. S.P.Detkov (All-Union Res. Project & Design Inst. of Metall. Heat Engng., Nonferrous Metall. & Refractories, Sverdlovsk, USSR).
J. Eng. Phys. (USA), vol.43, no.2, p.883-7 (Aug. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.2, p.244-9 (Aug. 1982). [received: April 1983]
Presents a new method of calculating heat exchange on the heating surfaces in furnaces with a real medium but without scatter, with multiple reflections making a considerable contribution to the heat flow. (4 refs.)

71337 Application of the Ritz method in interrelated heat- and mass transfer problem solving. Yu.T.Glazunov.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.1, p.96-103 (1983). In Russian.
The possibility of application of the Ritz method is presented in interrelated heat- and mass transfer problem solving under Type I boundary conditions. Thermophysical environmental parameters are considered to depend on transfer potentials. Variational solutions offer considerable precision and good convergence. (4 refs.)

71338 Determining the temperatures in multilayer refractory walls on an analog computer. G.A.Ketslakh (Eastern Coal Chem. Sci.-Res. Inst., USSR).
Refractories (USA), vol.23, no.7-8, p.347-50 (July-Aug. 1982). Translation of: *Ogneupory (USSR)*, vol.23, no.7, p.21-3 (July 1982). [received: April 1983]
The use of the analog computer provides a marked gain in time in comparison with manual calculation in cases in which many variations of walls with different thicknesses of layers of the same materials are calculated. Additional calculation of the functions ϕ and rearrangement of the functional blocks are not required. The solution amounts to a change in certain coefficients and selection of the input voltages. In calculating 30 variations of a three-layer wall the test operator spends no more than 1 h, which provides an approximate 10 times saving in time in comparison with manual calculation by the method of successive approximations. (3 refs.)

71339 Enhancement of radiation cooling by means of reflectors. M.S.Marreiros (Inst. Superior de Engenharia de Lisboa, Lisboa, Portugal), R.Rosa.
Sol. Energy (USA), vol.30, no.5, p.463-71 (1983).
It is shown that radiation cooling to a clear sky can be substantially enhanced by coupling a reflector to the radiator. The class of reflectors considered in this study is the CPC truncated on the side of the exist aperture. It is estimated that, under real circumstances, the cooling power per unit area of entrance aperture can be nearly doubled, with the help of a truncated CPC trough reflector, and the equilibrium limit temperature can be brought some 24°C further down. A truncated CPC dish reflector can still improve on the equilibrium temperature but at the cost of some loss of cooling power. The device can still operate satisfactorily in the day time. (5 refs.)

44.40 RADIATIVE HEAT TRANSFER

71340 A comparison on the stability of horizontal fluid layers with radiative heat generation for two and three porous plates. M.A.Hassab (Dept. of Mech. Engng., Alexandria Univ., Alexandria, Egypt).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.2, p.163-70 (March-April 1983).
This note is an extension to a recent work reported by Hassab (1982) on the effect of suction on the thermal stability of a horizontal-fluid layer with non-uniform volumetric heat sources. The heat generation was by way of absorption of incident radiation penetrating the fluid body, which was contained between two porous plates. The purpose of the present work is to extend the analysis for the case in which the fluid layer is divided into two sublayers, by inserting a third transparent porous plate inside it, and to compare the results for the two cases. This work may be applicable to solar heating systems. (2 refs.)

71341 Comparison of radiative transfer approximations for a highly forward scattering planar medium. M.P.Menguc, R.Viskanta (Heat Transfer Lab., Purdue Univ., West Lafayette, IN, USA).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.381-94 (May 1983).
The authors examine critically the accuracy of the two-flux, spherical harmonics and discrete ordinates methods for predicting radiative transfer in a planar, highly-forward scattering and absorbing medium. Numerical results for the radiative fluxes show that the two-flux and P_3-approximations yield accurate results compared to solutions based on the F_N-method. Indeed, these approximate methods are relatively simple and have potential for generalization to predict radiative transfer in multidimensional systems, as long as an appropriate simplification of the phase function is utilized. (41 refs.)

71342 Normalized spectral-distribution function of black body radiation. T.Ishikawa (Illuminating Engng. Inst. of Japan, Tokyo, Japan).
J. Illum. Eng. Inst. Jpn. (Japan), vol.67, no.1, p.13-14 (Jan. 1983). In Japanese.
Plank's law of radiation shows that the emissive power $M_{e\lambda}$ from a perfect radiator (black body) is a strong function of both wavelength λ and absolute temperature T(K). The ratio $f(\lambda T)=M_{e\lambda}(\lambda,T)/M_{e\lambda}(\lambda_m,T)$, where λ_m is the wavelength for maximum emissive power for the temperature T, is called the normalized spectral-distribution function. The total amount of radiation emitted at a particular temperature can be obtained by integrating Plank's law over all wavelength: viz. $\int_0^\infty M_{e\lambda}(\lambda,T)d\lambda$. The ratio $F(\lambda kT)=\int_0^\lambda M_{e\lambda}(\lambda,T)d\lambda/\int_0^\infty M_{e\lambda}(\lambda, T)d\lambda$ is called the normalized cumulative spectral-distribution function. These functions are often convenient for applications compared with Plank's law. (3 refs.) *K.B.*

71343 Geometric configuration factors for polygonal zones using Nusselt's unit sphere. F.W.Lipps (Energy Lab., Univ. of Houston, Houston, TX, USA).
Sol. Energy (USA), vol.30, no.5, p.413-19 (1983).
The Energy Laboratory of the University of Houston has developed a computer simulation program called CREAM (Cavity Radiation Exchange Analysis Model) for application to the solar central receiver system CREAM contains a geometric configuration factor generator based on Nusselt's method. A formulation of Nusselt's method provides the basis for a FORTRAN subroutine NUSSELT. Numerical results from NUSSELT are compared to analytic values and values from Sparrow's method. Sparrow's method is based on a double contour integral and its reduction to a single integral which is approximated by Gaussian methods. Nusselt's method is adequate for the intended engineering applications, but Sparrow's method is an order of magnitude more efficient in many situations. (11 refs.)

Comput. & Struct. (GB), vol.17, no.3, p.335-8 (1983).
Reponse of aircraft, idealised as a two degree of freedom system, to pulse excitation is obtained using Runge Kutta algorithm on a microcomputer MICRO 2200. The procedure is illustrated by a numerical example. (2 refs.)

71348 Identifying vibrations in designing thin-walled structures with elastically attached weights. A.A.Malinin.
Sov. Appl. Mech. (USA), vol.18, no.8, p.752-6 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.90-4 (Aug. 1983).
An appreciable number of instruments, devices, etc. are attached to modern thin-walled structures in quite a few cases. Nonsymmetrical location of these objects relative to the symmetry axis of the structure promotes interaction among the elastic vibrations of the structure in different directions, which makes it necessary to allow for elastically attached weights (elastic subsystems) in the design. By performing a preliminary analysis to determine the partial dynamic and independent stiffness characteristics of weights (elastic subsystems) attached to a thin-walled structure, the author solves the problem of determining the dynamic characteristics of the structure as a whole with allowance for the elastically attached weights. 71349 Problems of controlling by the right-hand sides of elliptical systems and their application to control of the stress-strain state in shells. V.G.Litvinov, Iu.I.Rubezhanskii.
Appl. Math. & Mech. (USA), vol.46, no.2, p.256-60 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.331-6 (1982).
The problem of controlling by the right-hand sides of elliptical systems is considered for the case when the target function is a function of a maximum, and the set of admissible controls is not convex. The existence of a solution of an infinite-dimensional optimal control problem is proved and problems arising in the course of approximating the latter solution by solutions of the finite-dimensional problems are studied. The problems of controlling the stress-strain state of shells of revolution are used as examples. In this case the largest deviation of the stresses or displacements in the shell from the given values is minimized, with constraints imposed on the strength. (12 refs.)

71350 Optimal analysis of the composite structure with double cylindrical shells. Song Tian-xia (Huazhong Inst. of Technol., China).
Acta Mech. Solida Sin. (China), no.2, p.179-88 (1981). In Chinese.
An unconstrained optimization analysis of the composite structure has been made. In the course of optimization, not only is the hybrid penalty function introduced, a new interpolation for solving one-dimensional optimization problems is also developed. The computer program proposed is applicable to the optimal analysis of ordinary structures. (8 refs.)

71351 Determination of the flexural center of blade profiles by non-orthogonal coordinate difference method. Lu Zhong-ming (Shanghai Power Plant Equipment Res. Inst., Shanghai, China).
Acta Mech. Solida Sin. (China), no.3, p.302-11 (1981). In Chinese.
The flexural center of sections with complex curved boundaries like those of blade profiles is calculated by obtaining solutions for stress functions and warping functions with a non-orthogonal coordinate difference method. To determine the flexural center, a number of lattices that approach in shape the given boundaries should first be chosen and an appropriate non-orthogonal coordinate system taken. Then, after difference schemes are derived with the help of loop integrals in the mesh region, solutions are found by a direct method for the sets of symmetric bond type linear algebraic equations obtained and Romberg's formula is used to numerically integrate the functional values of the mesh points. In conclusion, to demonstrate the precision of the proposed method, some elliptic and semicircular sections are treated and the calculated values satisfactorily approach those of exact solutions. (3 refs.)

71352 Dual methods for optimizing finite element flexural systems. C.Fleury, G.Sander (Aerospace Lab., Univ. of Liege, Liege, Belgium).
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.37, no.3, p.249-75 (May 1983).
The idea of generalized optimality criterion (GOC), set forth in previous papers for bar, membrane, and pure bending elements is extended to deal with general beam and flat shell elements. The modifications brought to the GOC results in explicit approximations for the behavior constraints that are correct up to the first order, but that exhibit a more complex algebraic form. Indeed, these explicit expressions are no longer merely linear in the reciprocal design variables. However, they continue to be additively separable, and therefore dual methods remain fully applicable, just as in the original statement of the GOC approach. Numerical examples are presented to demonstrate the efficiency of the method. (23 refs.)

71353 Dynamic response of frameworks by numerical Laplace transform. D.E.Beskos (Dept. of Civil & Mineral Engng., Univ. of Minnesota, Minneapolis, MN, USA), G.V.Narayanan.
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.37, no.3, p.289-307 (May 1983).
Presents a general method for determining the dynamic response of complex three-dimensional frameworks by dynamic shocks, wind forces or earthquake excitations. The method consists of formulating and solving the dynamic problem in the Laplace transform domain by the finite element method and of obtaining the response by a numerical inversion of the transformed solution. The formulation is based on the exact solution of the transformed governing equation of motion of a beam element, and it consequently leads to the exact solution of the problem. Flexural, axial and torsional motion of the framework members are considered. The effects of damping (external viscous or internal viscoelastic), axial forces on bending, rotatory inertia and shear deformation on the dynamic response are also taken into account. Numerical examples to illustrate the method and demonstrate its merits are presented. (28 refs.)

71354 Application of extended equations of Galerkin to stability problems of rectangular plates with free edges and subjected to uniformly distributed follower forces. H.H.E.Leipholz (Dept. of Civil & Mech. Engng., Univ. of Waterloo, Waterloo, Ontario, Canada), F.Pfendt.
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.37, no.3, p.341-65 (May 1983).
Shows how an extended version of Galerkin's method can be used to treat plates with free edges by means of 'beam functions' as coordinate functions. (7 refs.)

71355 Optimization of deformable systems under multicriterion conditions. V.I.Mossakovs'kii, Yu.M.Pochtman, S.M.Semenets.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.4, p.51-4 (1983). In Ukrainian.
Sources, specificity and place are discussed for multicriterion problems of designing deformable systems. A general method is suggested for reducing these problems to standard optimization ones. Main attention is paid to authenticity and correct description of the information used. A model of weight-cost optimization of a composite shell working for stability at external pressure is built as an example. (5 refs.)

71356 The loading of a hollow cylinder by moveable loads. V.V.Dubrinin, A.V.Remizov.
Izv. VUZ Mashinostr. (USSR), no.3, p.3-8 (1983). In Russian.
Discusses the case of the loading of a resilient hollow cylinder, moving at the same fixed rate under semi-infinite fixed pressure and a tangential trapezoidal load which is in shear with the normal load. The stresses and deformations set up in the cylinder are investigated. The results can be applied in the analysis and design of tubes, loaded by normal and tangential loads, moving at the same fixed velocity and with different load shears. (3 refs.) *Z.F.V.*

71357 Hetenyi's elastic quarter space problem revisited. L.M.Keer, J.C.Lee, T.Mura (Technol. Inst., Northwestern Univ., Evanston, IL, USA).
Int. J. Solids & Struct. (GB), vol.19, no.6, p.497-508 (1983).
Transform methods are used to solve the problem of an elastic quarter space subjected to tractions on its surface. The analysis uses the reflection principle to formulate problem as the solution of unknown residual surface tractions. A Fourier transform is taken in the direction of the edge of the quarter space. The problem is thereby reduced to decouplable integral equations, which are similar to those for the elastic quarter plane. Field quantities are obtained by performing the appropriate inverse transforms and the present results are compared with those of Hetenyi for the normally loaded case. Additional results are given for the cases of tangential surface loading. (10 refs.)

71358 On the stress in rigid bodies. G.Grioli (Istituto di Analisi e Meccanica, Univ. di Padova, Padova, Italy).
Meccanica (Italy), vol.18, no.1, p.3-7 (March 1983).
The possibility of establishing constitutive equations for rigid bodies is shown. The idea is proposed that the stress of a rigid body is indeterminate. (11 refs.)

71359 Optimum design of plates and shells taking account of the physical nonlinearity. V.V.Bochkarev, V.A.Krys'ko (Saratov Polytech. Inst., Saratov, USSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.620-5 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.52-7 (July 1982). [received: March 1983]
Proposes an approach for the design of minimum weight physically nonlinear shallow plates and shells which are rectangular in plan and are acted upon by a transverse load. The authors introduce constraints on the minimum thickness and stress intensity, and solve the physically nonlinear problem by the method of variable elasticity parameters. The equations of state of a shell are solved by a modified Vlasov-Kantorovich method (variational iterations). (9 refs.)

71361 Analysis of plates and shells by the semi-analytical and semi-discretizing method. He Guang-qian, Zhang Wei-yue (Chinese Acad. of Building Res., China).
Acta Mech. Solida Sin. (China), no.2, p.128-40 (1981). In Chinese.
A semi-analytical and semi-discretizing method for the moment theory analysis of elastic plates and shells is presented. Analytic solutions are first derived which satisfy the relevant fundamental differential equations for all points within the boundaries of the plates and shells and various boundary conditions can be satisfied at suitably chosen discrete points of the boundary by the method of collocation. The present method of analysis covers the solution of plates, elliptic paraboloidal shallow shells with unequal radii of curvature, cylindrical shells, shallow spherical shells as well as hyperbolic paraboloidal shallow shells. Numerical solutions for five different examples are also given. By the present method, the resulting matrix equation can be very easily formed and is of much lower order and takes less computer-time. The final results can meet the precision deemed necessary for the design of plates and shells. Furthermore, it offers a better understanding of the features of the analytic solution as well as a good insight into the distribution of the internal stresses and deformations of the plates and shells. (3 refs.)

71362 The finite element method for thin-walled elastic curved beams. He Fu-bao (Chekiang Univ., China).
Acta Mech. Solida Sin. (China), no.2, p.141-57 (1981). In Chinese.
The stiffness matrices of thin-walled elastic curved beams of open and closed sections are given by the displacement method. The polynomial approach is chosen for the displacement model and the effect of temperature is considered. For thin-walled elastic curved beams of closed section, the author adopts the well-known Ullmanski's hypothesis. The linear element of the cross-section has been utilized by the author to discuss the discrete computation of Saint-Venant's torsional function in accordance with the rule of linear distributional approach. (3 refs.)

71363 Stress formula of large curvature toroidal shells in symmetrical deformation. Huang Yen.
Acta Mech. Solida Sin. (China), no.3, p.380-3 (1981). In Chinese. (1 ref.)

71364 Field redistribution in finite elements—a mathematical alternative to reduced integration. J.F.Olesen (Dept. of Structural Engng., Tech. Univ. of Denmark, Lyngby, Denmark).
Comput. & Struct. (GB), vol.17, no.2, p.157-9 (1983).
A general method for 'redistributing' high-order finite element fields into lower order fields is presented. Occasionally consistent finite element procedures lead to abnormal solutions. The heuristic method of reduced integration has been proposed as a cure and good results have previously been achieved. However, the method of field redistribution presented here is consistent with a variational principle and may for this reason be more appealing. The method is applied to a simple shear flexible beam element and it is shown that in this special case the resultant element stiffness matrix is identical to the one obtained by employing reduced integration. (6 refs.)

71365 Reflections on the computational approximation of elastic incompressibility. I.Fried (Dept. of Math., Boston Univ., Boston, MA, USA).
Comput. & Struct. (GB), vol.17, no.2, p.161-8 (1983).
Gradual diminuation of compressibility tied with mesh refinement is shown to be an effective and practical way to numerically cope with near incompressibility of elastic solids. It is remarked that (low order) numerical integration is a side issue in this technique and that (high order) exact integration of high order finite elements can be safely used with the correct minimal variation principle of classical elasticity, including a high Poisson ratio. (16 refs.)

71366 Application of methods of feasible directions to structural optimization problems. E.A.Sadek (Faculty of Engng., Cairo Univ., Cairo, Egypt).
Comput. & Struct. (GB), vol.17, no.2, p.183-91 (1983).
A general approach to structural optimization, which has received much attention in recent years, is that of using mathematical programming (numerical search) techniques. These techniques may be separated into direct and indirect methods. Of the direct methods of attack on general nonlinear inequality constrained problems, the largest class is called methods of feasible directions. This paper presents the application of Zoutendijk's method of feasible directions to structural optimization problems. The algorithm requires the analytic gradient of the objective function and the constraint functions which are active at a given stage in the design process. A considerable improvement in convergence has been achieved by considering each pushoff factor as a linear function of the corresponding active constraint. A comparison of the half-step versus full-step search procedure is presented. An initial step length based on a present decrement of objective function is used. A discussion of the linear versus quadratic interpolations of a constraint function in search for a bound point is presented. The algorithm is demonstrated with elastic design of a 25-bar space tower, a 3-bay single storey and a double bay double storey rigid jointed plane frames. Data on the differences in the optimum designs obtained from different starting points is reported. (5 refs.)

71367 Orthotropic cylindrical shells under line load along a generator. U.S.Chawla (Solid Mech. Technol., Dominion Engng. Works Ltd., Montreal, Quebec, Canada).
Comput. & Struct. (GB), vol.17, no.2, p.211-16 (1983).
A technique is developed for elastic analysis of an orthotropic cylindrical shell subjected to a uniform line load along a generator. An accurate form of governing differential equations is derived and a mathematically discrete element method is used for its solution. The shell is divided into a finite number of longitudinal strips and the derivatives with respect to the circumferential

coordinate in the governing equation are replaced by their finite difference relationships. The solution of the resulting equations is written in closed form. A computer program to implement this technique is developed and the computed results are compared with published experimental and analytical results. Excellent agreement is obtained. Some new results for a shell with fixed end boundary conditions are also presented. (7 refs.)

71368 Torsion of tube structures: planar formulation. A.Rutenberg, M.Eisenberger (Faculty of Civil Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Comput. & Struct. (GB), vol.17, no.2, p.257-60 (1983).
It is shown that the torsional analysis of tube structures can be performed directly by means of standard plane frame or plane stress finite element computer programs rather than by three-dimensional procedures. By considering in-plane rigidity of the floor slab and the presence of an elastic axis, it is shown that the only modifications required in these programs are the separate assembly of the stiffness submatrices of elements located at different distances from the axis, and the factoring of results by the distance ratios to a reference frame. (7 refs.)

71369 Optimization for structures of discrete-size elements. Hsichun M. Hua (Aero Industry Dev. Center, Taiwan).
Comput. & Struct. (GB), vol.17, no.3, p.327-33 (1983).
An optimization algorithm has been developed for finding the minimum weight design of the structure assembled with the material of discrete sizes. The essence of it is an efficient implicit enumeration of eliminating systematically the nonoptimal solutions. This algorithm is flexible in application with regard to the type of behavior constraints. Therefore, it is applicable to most practical problems of aerospace structure design. Examples are included in the paper to demonstrate the usefulness of this method. (13 refs.)

71370 A study of shear factors in reduced-selective integration Mindlin beam elements. W.L.Mindle, T.Belytschko (Dept. of Civil Engng., Northwestern Univ., Evanston, IL, USA).
Comput. & Struct. (GB), vol.17, no.3, p.339-44 (1983).
The influence of the shear correlation factor on the convergence of a reduced-selective integration Mindlin beam element is investigated for structural dynamics problems. This is accomplished through a frequency analysis of an infinite mesh and a single element, which shows that reduction of the shear factor lowers the maximum frequency of the mesh without affecting its spectral fidelity in low and moderate frequencies. This enables larger critical time steps to be used for explicit integration without disturbing convergence of the element. (9 refs.)

71371 Minimum-weight design with displacements constraints in 2-dimensional elasticity. A.Zochowski (Systems Res. Inst., Warsaw, Poland), K.Mizukami.
Comput. & Struct. (GB), vol.17, no.3, p.365-9 (1983).
The optimum weight-bounded deflection design of a beam, modelled by means of a set of two-dimensional elasticity equations is studied. The iterative algorithm based on differentiation with respect to the domain formulae is proposed. Numerical solutions are given for beams, damped on one or on two sides, under different loading conditions. The results are compared with those of a straightforward approach. (12 refs.)

71372 A nonlinear, semi-analytical finite element analysis for nearly axisymmetric solids. M.Sedaghat (Facultad de Ingenieria Civil, Univ. de Concepcion, Concepcion, Chile), L.R.Herrmann.
Comput. & Struct. (GB), vol.17, no.3, p.389-401 (1983).
Describes the development of the theory and accompanying computer program for a semi-analytical finite element analysis of nonaxisymmetrically loaded, nearly axisymmetric solids. The theoretical basis of the method together with numerical procedures for handling boundary conditions, rigid body motion and the iterative solution process are described. A finite element program for evaluating the analysis is discussed, evaluated for effectiveness and applied to several examples. The range of application of the analysis for inhomogeneous, orthotropic, nonlinear and nearly axisymmetric bodies is demonstrated by a series of examples. The substantial savings in computer time and memory are compared to a conventional finite element analysis is discussed. (14 refs.)

71373 A simple selectivity integrated torsion—flexure coupled tapered beam element with transverse shear deformation. B.R.Somashekar (Structures Div., Nat. Aeronaut. Lab., Bangalore, India).
Comput. & Struct. (GB), vol.17, no.3, p.403-6 (1983).
A tapered beam element with torsional flexibility and transvearse sher deformation is developed for use in swept plate studies. Recently established guidelines for selective reduced integration allow the use of independent interpolation functions for the transverse deflection, rotation and torsional rotation to obtain an element that does not lock in extremely thin situations encountered in thin beam/plate analysis. The element is tested for free vibration and for the static case of a severely swept cantilever plate of high aspect-ratio subjected to uniform distributed load. The results indicate very good performance of the element. (8 refs.)

71374 A unified approach for the analysis of bridges, plates and axisymmetric shells using the linear Mindlin strip element. E.Onate, B.Suarez (ETS Ingenieros de Caminos, Jorge Girona Salgado, Barcelona, Spain).
Comput. & Struct. (GB), vol.17, no.3, p.407-26 (1983).
A finite strip formulation is presented which enables one to treat bridges, axisymmetric shells or plate structures of constant transverse cross section in an easily and unified manner. The formulation is based on Mindlin's shell plate theory. One dimensional finite elements are used to discretize the transverse section and Fourier expansions are used to define the longitudinal/circumferential behavior of the structure. The element used is the simple two noded strip element with just one single integrating point. This enables one to obtain all the element matrices in an explicit and economical form. Numerical examples for a variety of straight and curved bridges, axisymmetric shells and plate structures which show the efficiency of the formulation and accuracy of the linear strip element are given. (32 refs.)

71375 A comparison of the linear, quadratic and cubic Mindling strip elements for the analysis of thick and thin plates. E.Onate, B.Suarez (ETS Ingenieros de Caminos, Jorge Girona Salgado, Barcelona, Spain).
Comput. & Struct. (GB), vol.17, no.3, p.427-39 (1983).
The behaviour of the linear, quadratic and cubic elements of the Mindlin plate strip family for thick and very thin plate analysis is investigated. Selective integration techniques are used to ensure the good behaviour of the elements when dealing with thin plates. Numerical results, showing the convergence and accuracy of the elements for the analysis of plates of a wide range of thicknesses, are given. The general performance of the three elements is discussed in detail. In particular, the linear element with a single integration point seems to be the best value strip element for practical purposes. (27 refs.)

71376 Deformation of flexible shells of revolution. Ya.M.Grigorenko, M.M.Kryukov, V.S.Dem'yanchuk.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.4, p.42-6 (1983). In Ukrainian.
A numerical approach is suggested to solve boundary value problems on deformation of flexible shells of revolution of variable thickness in meridian and circular directions under nonuniform loads. Using difference approximation along the circular coordinate a two-dimensional nonlinear boundary value problem is reduced to a unidimensional one which is solved by the linearization method. Examples of numerical solution of particular problems are available. (12 refs.)

71377 Beams with cable connected boundaries. J.Holnicki-Szulc (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Int. J. Eng. Sci. (GB), vol.21, no.7, p.753-64 (1983).
An analysis of beams reinforced by families of cables is presented. Neglecting friction between the two phases of material (the matrix and the family of cables), the influence of reinforcement is nonlocal and caused by the direct connection between boundaries introduced through the cables. Reduction to the case of locally reinforced beams with full adhesion along the fibers is discussed. Comparison between these two models of reinforcement leads to a definition of a global measure of the nonlocality of the problem. The general problem of elastic bodies reinforced by families of cables attached at boundaries is discussed in the Appendix. (10 refs.)

71378 Solutions of the torsion problem for some kinds of bars with multiply connected section. Chen Yi-Zhou (Div. of Solid Mech., North-Western Polytech. Univ., Xian, China), Chen Yi-Heng.
Int. J. Eng. Sci. (GB), vol.21, no.7, p.813-23 (1983).
This paper is a continuation of previous papers by Chen Yi-Zhou (see Engng. Fracture Mech., vol.13, p.193, 1980, ibid., vol.19, p.791, 1981). In the paper the multiply connected region dealt with is a rectangular section containing several rectangular holes. The boundary value problem of such a multiply connected region in the case of torsion problem can be divided into two similar problems. Each one of these problems belongs to a Dirichlet problem of Laplace equation. There is only one undetermined constant K, which is determined from the single value condition of the displacement. When solving these boundary value problems, the original section is divided into several rectangular subregions, and then the Duhem theorem (see Appendix I) is used. After two boundary value problems are solved, the undetermined constant K can be found by using the above mentioned condition. Finally, the torsional rigidity can be easily deduced. Three sets of numerical results are shown. (6 refs.)

71379 The torsion of a microelastic half-space by a flat annular rigid stamp. M.Lal (School of Studies in Math., Jiwaji Univ., Gwalior, India).
Int. J. Eng. Sci. (GB), vol.21, no.7, p.825-32 (1983).
Seeks to solve the problem of an elastic half space under torsion by a flat annular rigid stamp in linear micropolar elasticity. The problem is reduced to the solution of a system of four Fredholm integral equations of the second kind in four unknown functions. An iterative solution of these integral equations has been obtained for $\lambda=a/b\ll1$ for the case of simple rotation through a small angle ω_0 and the corresponding classical results have been obtained. (14 refs.)

71380 The glass as an elastic continuum. D.M.Duffy (J.J. Thomson Phys. Lab., Univ. of Reading, Reading, England).
J. Phys. Colloq. (France), vol.43, no.C-9, p.475-9 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The theory of elasticity of continuous media is applied to amorphous materials, whose symmetry is completely broken. It is shown that a single line defect, a Z_2 disclination, survives the absence of generative symmetry, and that the arbitrariness of the local reference frame can be expressed as a SO(3) gauge symmetry. The authors derive the physical consequences of the existence of these disclinations (two-level systems, Vogel-Fulcher law), and their elastic energy, which is screened down to Coulomb potential by thermal fluctuations in the dislocation part of the incompatibility. (11 refs.)

71381 Thermal stresses in partially absorbing flat plate due to sudden interruption of steady-state asymmetric radiation. I. Convective cooling at rear surface. J.I.Frankel, J.P.Singh, J.R.Thomas,Jr., D.P.H.Hasselman (Dept. of Mech. Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
J. Therm. Stresses (USA), vol.6, no.1, p.15-24 (Jan.-March 1983). [received: May 1983]
An analysis is presented of the thermal stresses in a partially absorbing flat plate due to sudden interruption of steady-state asymmetric thermal radiation on the front face with convection cooling at the rear face. Maximum transient tensile stresses occur in the rear surface and are almost independent of the heat transfer coefficient, h. For optical thicknesses of ≥0.5 μa, the maximum tensile stress initially rises to reach a peak and then decreases with time. In contrast, for thicknesses ≤0.5 μa, the stresses decrease monotonically. It is shown that a plot of nondimensional stress as a function of nondimensional time for a given value of μa and h does not result in a universal plot from which thermal stresses can be obtained for any value of plate thickness. (5 refs.)

71382 Thermal stresses in partially absorbing flat plate due to sudden interruption of steady-state asymmetric radiation. II. Convective cooling at front surface. J.P.Singh, J.I.Frankel, J.R.Thomas,Jr., D.P.H.Hasselman (Dept. of Materials Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
J. Therm. Stresses (USA), vol.6, no.1, p.25-34 (Jan.-March 1983). [received: May 1983]
For pt.I see ibid., vol.6, no.1, p.15 (1983). Analyses the thermal stresses in a partially absorbing flat plate, due to a sudden interruption of steady-state asymmetric radiation on the convectively cooled front face. As in the case of pt.I, the maximum tensile stresses occur in the rear face. For the optical thickness $\mu a\geq0.5$, the maximum tensile stress initially rises to a peak and then decreases with time. On the other hand, for $\mu a\leq0.5$, the stresses decrease monotonically with time. A comparison of the results for the front (pt.II) and rear (pt.I) cooling indicates that values of the maximum stress are numerically indentical for small values of heat transfer coefficient h, and plate thickness a. Increasing difference in the magnitude of the stresses for the two cases is found with increasing h and a. (3 refs.)

71383 Eigenvalue approach to thermoelasticity. N.C.Das, S.N.Das, B.Das (Dept. of Math., Jadavpur Univ., Calcutta, India).
J. Therm. Stresses (USA), vol.6, no.1, p.35-43 (Jan.-March 1983). [received: May 1983]
The general problem of the one-dimensional linearized simultaneous equations of thermoelasticity has been solved in the Laplace transform domain by following the algebraic eigenvalue approach. This is an alternative which retains the original structure of the problem compared to the recent state space methodology of Bahar and Hetnarski (see ibid., vol.1, p.135, 1978 and vol.2,

p.28, 1979). The use of a thermoelastic potential is thus avoided. The results obtained can be used to a broad class of problems in thermoelasticity or other coupled fields. Applications to problems pertaining to a half space and a layer are presented. (10 refs.)

71384 Thermoelastic polynomials. J.Ignaczak (Polish Acad. of Sci., Warsaw, Poland).
J. Therm. Stresses (USA), vol.6, no.1, p.45-55 (Jan.-March 1983). [received: May 1983]
A theory of thermoelastic polynomials that determine fundamental solutions of a central equation of linear thermoelasticity with finite wave speeds is developed. The polynomials define series solution of the Neumann type for an integro-differential equation on the time axis associated with a method of separation of variables for the central equation. A number of recurrence relations defining basic properties of the thermoelastic polynomials are presented. In particular, it is shown that the polynomials can be identified with an element of the null space of a linear ordinary differential operator. (3 refs.)

71385 Transient thermal stress problem in a tranversely isotropioc finite circular cylinder under three-dimensional temperature field. N.Noda (Dept. of Mech. Engng., Shizuoka Univ., Hamamatsu, Japan).
J. Therm. Stresses (USA), vol.6, no.1, p.57-71 (Jan.-March 1983). [received: May 1983]
Deals with a transient thermal stress problem in a finite circular transversely isotropic solid cylinder subjected to an asymmetrical temperature distribution on a cylindrical surface. The stress fields are found by use of the potential functions method. As an example, the temperature and stress fields for a specific case are computed as a comparison with an isotropic body. (10 refs.)

71386 Eigenvalue approach to magnetothermoelasticity. N.C.Das, A.K.Mitra, R.K.Mahalanobis (Dept. of Math., Jadavpur Univ., Calcutta, India).
J. Therm. Stresses (USA), vol.6, no.1, p.73-92 (Jan.-March 1983). [received: May 1983]
Arranges the equations representing the one-dimensional, linearized, simultaneous, coupled problem of magnetothermoelasticity in the form of a matrix differential equation in the Laplace transform domain. The problem is then converted to an algebraic eigenvalue problem and solved in the same domain. The results obtained can be used to solve a broad class of problems in magnetothermoelasticity. Applications to problems pertaining to a half-space and a layer are presented. The results obtained for some special cases are compared to the results in the literature. (13 refs.)

71387 Notes on the principle of hybrid technique in experimental stress analysis. K.-H.Laermann (Univ. Wuppertal, Wuppertal, Germany).
Mess. & Pruef. (Germany), vol.19, no.4, p.184-90 (April 1983). In German.
Discusses the basic principles of the hybrid technique. Examples show its application to the stress analysis of plates in bending. The hybrid technique combines mathematical and physical models and experiment for the solution of problems which cannot be solved by theoretical or numerical methods. (7 refs.) *J.S.*

71388 The location of centres of torsion and flexure. P.Muller (CNRS, Univ. Pierre et Marie Curie, Paris, France).
Mech. Res. Commun. (GB), vol.9, no.6, p.367-72 (Nov.-Dec. 1982). In French. [received: March 1983]
Expressions for the co-ordinates of the centres of torsion (C_T) or flexture (C_F) are obtained from the three-dimensional problem of Saint-Venant. Except for sections presenting two axes of symmetry the two centres do not coincide, the difference being particularly important in the case of thin profiles of variable thickness. C_T and C_F are defined for an elastic, homogeneous, isotropic, cylindrical beam, encastre at one end and loaded at the other end. The relation between C_T and C_F is investigated mathematically for the case of a beam of constant thickness and a beam of variable thickness. (5 refs.) *H.E.G.*

71389 Determination of stresses in a diffusion coating applied to a rod under tension. V.F.Shatinskii, Yu.S.Safarov, R.N.Garlinskii (Physicomech. Inst., Acad. of Sci., Kiev, Ukrainian, SSR).
Strength Mater. (USA), vol.14, no.5, p.654-63 (May 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.5, p.75-82 (May 1982). [received: May 1983]
The method developed and based on general assumptions for applied elasticity theory makes it possible to carry out analytical studies of the stress state for rod shaped articles with a diffusion coating under tension (compression). The equations and analysis proposed make it possible to establish optimum coating layer parameters for specific examples of rod shaped articles. (14 refs.)

71390 Numerical anaysis of stressed state of thin shells with curvilinear holes. E.A.Gotsulyak, V.I.Gulyaev, K.Pemsing, I.S.Chernyshenko (Kiev Inst. of Structural Engng., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.734-40 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.70-7 (Aug. 1983).
The authors develop a finite-difference method for numerical analysis of the stressed and strained state of shells of intricate geometry with curvilinear holes of various shapes. An algorithm is constructed for solving such problems and an analysis of numerical results is presented. (8 refs.)

71391 Solvability of boundary-value problems of the generalized theory of anisotropic shells. I.Yu.Khoma (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.741-8 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.78-84 (Aug. 1983). (10 refs.)

46.30J Viscoelasticity, plasticity, viscoplasticity, creep, and stress relaxation

(inc. rheology of solids)

71392 Homogenization for Kelvin-Voigt linearly viscoelastic bodies. G.Francfort, D.Leguillon, P.Suquet (Dept. de Mecanique Theorique, Univ. de Paris, Paris, France).
C.R. Seances Acad. Sci. Ser. I (France), vol.296, no.5, p.287-90 (7 Feb. 1983). In French.
The homogenization process for a linearly viscoelastic Kelvin-Voigt solid is re-examined in a quasi-static setting. A term of delayed memory appears in the expression of the homogenized stress fields. The associated kernel is explicitly derived. The elastic and instantaneously viscoelastic parts of the homogenized stress field are given in terms of the corresponding homogenized elastic and viscoelastic coefficients. (3 refs.)

71393 Plasticity analysis of slope with different flow rules. E.Mizuno (Dept. of Civil Engng., Nagoya Univ., Nagoya, Japan), W.F.Chen.
Comput. & Struct. (GB), vol.17, no.3, p.375-88 (1983).
The Drucker-Prager model with a non-associated flow rule as well as the associated flow rule is applied to obtain the elastic-plastic large deformation response of a vertical slope of insensitive clay using finite element method. A comparative study of the numerical results is made in the form of load-displacement curves, deformed shape of the slope at failure, limit loads, stress distributions, yielded zones and velocity fields. In addition, the meaning of limit load and failure mechanism is discussed in view of the present progressive failure analysis solution and the previous limit analysis solution. (11 refs.)

71394 Isoparametric finite difference energy method for plate bending problems. V.D.Barve, S.S.Dey (Dept. of Civil Engng., Indian Inst. of Technol., Kharagpur, India).
Comput. & Struct. (GB), vol.17, no.3, p.459-65 (1983).
Incorporates the concept of isoparametry in finite difference energy method making it more powerful and versatile to tackle complex plate bending problems with curved boundaries. This approach overcomes the drawbacks of the finite difference energy method and its application to practical problems is now feasible. In order to estimate the accuracy and reliability of the present formulation several isotropic plates with a variety of planforms are solved and the results are compared with the existing analytical and numerical solutions. (13 refs.)

71395 Approximate analysis of unsteady creep in conditions of stress concentration. Ya.M.Klebanov.
Izv. VUZ Mashinostr. (USSR), no.3, p.9-13 (1983). In Russian.
Nonlinear dependencies are derived, relating directly the external forces and stresses in the zone of their concentrations, assuming an invariant relative distribution of the stresses in the process of loading. The application of these dependencies is exemplified by examining an unsteady creep of a strip with a hole. Experimental data confirm the theoretical predictions. (9 refs.) *Z.F.V.*

71396 Theories of nonlocal plasticity. A.C.Eringen (Princeton Univ., Princeton, NJ, USA).
Int. J. Eng. Sci. (GB), vol.21, no.7, p.741-51 (1983).
Deformation and rate theories of nonlocal plasticity are formulated. Constitutive equations are obtained for elasto-plastic solids extending Levy-von Mises and Prandtl-Reuss theories to include nonlocal effects. Combined elastic-plastic constitutive equations are given. A nonlocal deformation theory is also presented. Thermodynamical restrictions are studied. (13 refs.)

71397 On the formulation of plane strain problems for elastic perfectly-plastic medium. Gao Yu-Chen (Harbin Shipbuilding Engng. Inst., Harbin, China), Hwang Keh-Chih.
Int. J. Eng. Sci. (GB), vol.21, no.7, p.765-80 (1983).
Starting from the 3-dimensional basic equations for elastic perfectly-plastic medium, the author has derived the strain-history-dependent yield conditions and constitutive equations for plane strain problems. For the elastic-plastic evolutionary problems with time-varying boundaries, two contiguity conditions for displacements are given in simple forms. It is proved that for the case $\nu=1/2$ (ν-Poisson's ratio), the equations are hyperbolic, and so, some discontinuities of solutions may occur inside the plastic region. On the other hand,

when $\nu<1/2$, the equations are elliptic, and so, the solutions will be sufficiently smooth inside the plastic region, and discontinuities can occur only across the boundaries between the elastic and the plastic regions. As $\nu\rightarrow1/2$, inner boundary layers will occur within which an abrupt transition takes place. The order of magnitude of the width of the inner boundary layer is estimated. It is proved that the stress discontinuities are impossible disregarding the exceptional case of the traces of elastic cores which shrinks to a line in the limiting state. The various relations for discontinuity gaps (or jumps) are given, both for the case of weak and the case of strong discontinuities. Finally, the basic equation and the corresponding four contiguity conditions are formulated for the stress-rate function, and a theorem for unloading is proved. The results obtained have been successfully applied to the analysis of elastic-plastic near-tip fields of cracks. (4 refs.)

71398 The structure of stress-strain relations in finite elasto-plasticity. L.Palgen (Inst. du Genie Civil, Univ. de Liege, Liege, Belgium), D.C.Drucker.
Int. J. Solids & Struct. (GB), vol.19, no.6, p.519-31 (1983).
The importance of the distinction between rotation in the continuum and material sense is emphasized. Starting from the stability of thin-walled tube test specimens, material stability at finite strains is formulated for any choice of conjugate stress and strain. Normality is investigated when total strain rates are non-integrable. It is the total strain rate minus the instantaneous elastic strain rate that follows normality. The general lack of normality exhibited by the rate of strain of the unloaded body element is evaluated quantitatively. A general criterion for convexity of the yield surface is established, and the effect on convexity of changing the stress definition is examined. (23 refs.)

71399 Frictional slip between a layer and a substrate due to a periodic tangential surface force. M.Comninou, J.R.Barber (Univ. of Michigan, Ann Arbor, MI, USA).
Int. J. Solids & Struct. (GB), vol.19, no.6, p.533-9 (1983).
A solution is given for the problem of an elastic layer pressed against an elastic half-plane and subject to a tangential force varying periodically in time. A loading cycle which initially causes localized slip is followed through unloading and reloading. A limiting load is established below which the steady state of the interface does not involve slip. (9 refs.)

71400 FORTRAN computer program for inextensional bending of a doubly curved shell triangular element. L.S.D.Morley (Royal Aircraft Establ., Farnborough, England).
Int. J. Numer. Methods Eng. (GB), vol.19, no.5, p.647-64 (May 1983).
A FORTRAN computer program is described which calculates physical quantities for a class of shell triangular elements undergoing inextensional bending. These elements are in quadratic parametric representation and may have positive, zero or negative Gaussian curvature. The exact inextensional bending solutions for the rectangular displacement components are cubic in the surface co-ordinates and the curvature changes are relatively slowly varying. (2 refs.)

71401 Bending of a concentrically supported thin circular plate under a linearly varying load along an inner concentric circle. M.R.Shinouda (Faculty of Engng., Alexandria Univ., Alexandria, Egypt).
Indian J. Pure & Appl. Math., vol.14, no.2, p.270-9 (Feb. 1983).
Presents the transverse deflections in a closed analytical form for a thin isotropic circular plate supported on a concentric circle and subjected to a linearly varying load acting along a concentric circle lying within the circle of support. Expressions for moments, shearing forces, etc. are also derived. The three cases of a plate supported along its outer edge, a plate of an infinite diameter and a plate loaded by a couple at its centre are studied as limiting cases of the present problem. The last case has been solved before when the support lies at the outer edge and the results agree with the present work. Since the expressions obtained are difficult to use in normal calculations, the results are also presented in the form of charts covering a wide range of geometric parameters and ready to use for design purposes. (6 refs.)

71402 Letter concerning the paper 'On the double-sliding free-rotating model for the deformation of granular materials'. P.A.Vermeer (Dept. of Civil Engng., Delft Univ. of Technol., Delft, Netherlands), M.M.Mehrabadi, S.C.Cowin.
J. Mech. & Phys. Solids (GB), vol.31, no.3, p.281-6 (1983).
P.A. Vermeer comments that Mehrabadi and Cowin's inspection (see ibid., vol.29, p.269, 1981) of the double-sliding free-rotating model for granular materials has led to some incorrect conclusions. First, their conclusion that the idea of 'free' rotation is inconsistent with the restrictions on the strain rate is incorrect. Secondly, their conclusion that these restrictions ($a\geq0$, $b\geq0$) do not ensure positive energy-dissipation at material points is incorrect. In reply, Mehrabadi and Cowin contend that their conclusions reached in the paper in question are correct. The criticisms of these conclusions by Vermeer are due to misunderstandings on his part. The misunderstandings associated with each of the conclusions contested by Vermeer are described. (6 refs.)

71403 A study on mitigation of stress concentration around a transverse hole in a shaft by means of copper electroplating method. Y.Imamura, S.Sato, K.Ishida, F.Sunaoka.
J. Fac. Eng. Ibaraki Univ. (Japan), no.30, p.43-8 (1982). In Japanese.
Mitigation efficiencies of the stress concentration factors around transverse holes made by the countersinking method in a twisted shaft are measured by means of a copper electroplating method. The results obtained are as follows: (1) stress concentration factors are mitigated by the countersinking method and the mitigation efficiencies of the stress concentrations are maximum 22.5% in the bore surface; (2) in the shaft with a countersunk transverse hole, the stress concentrated locations are the four points on the cross section containing the axis of the hole on the outer shaft surface, and the eight points on the two sections which contain the axis of the hole and incline in the angles of ±45° with respect to the axis of the specimen in the bore surface and the incised surface respectively; (3) optimum countersinking depth is presented corresponding to the shaft and transverse hole diameters. (5 refs.)

71404 Chaotic flow in a model for repeated yielding. G.Ananthakrishna, M.C.Valsakumar (Materials Sci. Lab., Reactor Res. Centre, Tamil Nadu, India).
Phys. Lett. A (Netherlands), vol.95A, no.2, p.69-71 (18 April 1983).
Chaos exhibited by a model introduced in the context of repeated yielding is studied. The model shows an infinite sequence of period-doubling bifurcations with an exponent $\delta=4.67\pm0.1$. The associated one-dimensional map and the projection of the strange attractor are also studied. (13 refs.)

71405 Creep and rupture strength with a nonuniform stress state. V.S.Strelyaev, V.A.Petushkov, V.G.Krivonogov ('Energiya' Sci.-Industrial Assoc., Moscow, USSR).
Strength Mater. (USA), vol.14, no.5, p.577-83 (May 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.5, p.10-16 (May 1982). [received: May 1983]
The authors propose a general approach to finite-element investigation of stress-strain states and limiting states, the kinetics of these states in concentration zones during nonisothermal elastoplastic deformation, and creep of structures at high temperatures. Using a bar with fillets, the features of deformation and limiting states in creep are analysed along with the applicability of simplified engineering approaches. Basic parameters of fracture mechanics and laws of damage accumulation in the presence of cracks in the concentration zone are studied. (15 refs.)

71406 Cylindrical flexure of plate on linearly deformable base with action of longitudinal forces. V.V.Vorotyntsev, Yu.P.Zyukin (Odessa Inst. of Structural Engng., Odessa, USSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.648-52 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.88-92 (July 1982). [received: March 1983] (6 refs.)

71407 Three-dimensional theory of inelastic stability. Specific results. A.N.Guz', A.N.Sporykhin (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.671-93 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.3-27 (Aug. 1983).
A three-dimensional theory of the stability of deformed media at large subcritical deformations has been developed, the general properties of the problems have been investigated, general solutions have been constructed, problems of practical importance have been investigated in a three-dimensional formulation, and the characteristic effects have been calculated. (12 refs.)

71408 Stress in an axisymmetric solid, taking account of plasticity. V.I.Prokop'ev (Moscow Civil-Engng. Inst., Moscow, USSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.767-70 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.106-10 (Aug. 1983).
The author considers the problem of an axisymmetric deformed solid under the influence of an axisymmetric load. It is assumed that the load applied leads to small elastoplastic deformations, in certain parts of the solid. An iterative method and a finite element method are used to obtain the solutions. 46.30L Static buckling and instability

71409 Stability of a nonlinearity elastic cylinder under side pressure and axial compression. G.I.Volokitin.
Appl. Math. & Mech. (USA), vol.46, no.2, p.219-24 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.289-95 (1982).
The problem of loss of stability of thick-walled cylinders subjected to inhomogeneous initial stresses, is considered. The analysis is based on the exact three-dimensional equations of neutral equilibrium problems derived by superposing small on finite deformations. The law of the state is determined by a five-constant Murnaghan relationship. Cases are studied of the buckling of circular cylinders subjected to axial load and side internal and external hydrostatic pressure. Results are represented for calculations exhibiting the influence of nonlinearity on the upper critical load as a function of the geometric parameters. (7 refs.)

71410 On the theory of coupled loss of stability in stiffened thin-walled structures. A.I.Manevich.
Appl. Math. & Mech. (USA), vol.46, no.2, p.261-7 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.337-45 (1982).
A system of the principal nonlinear approximation equations is obtained for the problem of loss of stability in stiffened thin-walled structures in the presence of finite displacements, taking into account the presence of a set of local modes with critical loads differing little from each other. A concept of 'modified' local modes is proposed, allowing an estimation of the mode interaction already in the first nonlinear approximation. The possibility of simplification of the final system of equations, taking into account the fact that the local mode length is short compared with that of the overall mode, is shown. It is established that within the framework of the principal nonlinear approximation every local mode in stiffened plates and shells interacts with the overall mode, but there is no explicit interaction between the local modes themselves. A theorem is proved establishing the correlation between the system with one, and with many local modes. The problem of stability of a compressed stiffened plate, i.e. of a wide strut, is solved as an example. The proposed theory can be applied to structures almost equally stable when no local waves form up to the moment of coupled buckling. (12 refs.)

71411 General instability of ring-stiffened cylindrical shells subject to hydrostatic pressure. Hwang Keh-chih, Zheng Zhao-chang (Qing-hua Univ., China).
Acta Mech. Solida Sin. (China), no.3, p.271-86 (1981). In Chinese.
Presents a method for calculating the buckling load and mode shape of a ring-stiffened circular cylindrical shell subject to hydrostatic pressure. According to the composite structure method, a set of differential equations for the stability of the rings and interring shell segments are established separately. With the height of ring cross-section, eccentric distance, sum of cross-sectional area ΣF_r and sum of bending rigidity $\Sigma E_r I_{Gr\alpha}$ kept constant, the number of rings is assumed to tend to infinity, and an equivalent orthotropic shell with appropriate elastic constants is obtained as a zero-order approximation. Further, one can seek for the solution of equations for the ring-stiffened shell in the form of a series. The first term of the series corresponds to the zero-order approximation, i.e. the solution of the above-mentioned equivalent orthotropic shell. The remaining terms represent the correction of various orders, which may serve as an indication of the error arising from substituting the real ring-stiffened shell with the equivalent orthotropic one. (8 refs.)

71412 The theory of post-buckling of structures and its prospects. Huang Yu-ying, Jin Meng-Shi, Lei Guo-pu (Wuhan Huazhong Inst. of Technol., China).
Acta Mech. Solida Sin. (China), no.3, p.397-408 (1981). In Chinese.
Describes the historical background against which post-buckling theory has been developed, its analytical methods and prospects for the theory. (13 refs.)

71413 A reinvestigation of post-buckling behaviour of elastic circular plates using a simple finite element formulation. G.Venkateswara Rao, K.K.Raju (Aerospace Structures Div., Vikram Sarabhai Space Centre, Trivandrum, India).
Comput. & Struct. (GB), vol.17, no.2, p.233-5 (1983).
A modified finite element formulation to study the post-buckling behaviour of elastic circular plates is presented. A discussion on the derivation of nonlinear stiffness matrix for post-buckling analysis is included and the results are compared with continuum solutions. (8 refs.)

71414 Buckling and postbuckling of imperfect cylindrical shells under axial compression. I.Sheinman, G.J.Simitses (Georgia Inst. of Technol., Atlanta, GA, USA).
Comput. & Struct. (GB), vol.17, no.2, p.277-85 (1983).
A solution methodology is described for the complete analysis of a geometrically imperfect, thin, circular, cylindrical shell loaded by a uniform axial compression. The analysis includes prelimit-point behavior, the establishment of critical conditions (limit-point) and postlimit-point behavior. The solution scheme is then used to study the effects of various geometrical parameters (radius to thickness and length to radius ratios) on the response characteristics of an imperfect, unstiffened, thin, cylindrical shell. These effects are assessed for a virtually axisymmetric-type of geometric imperfection. (47 refs.)

71415 On torsional buckling of thin walled I columns with variable cross-section. C.Szymczak (Dept. of Civil Engng., Tech. Univ. of Gdansk, Gdansk, Poland).
Int. J. Solids & Struct. (GB), vol.19, no.6, p.509-18 (1983).
The problem of extreme critical conservative loads of torsional buckling for axially compressed thin walled I columns with variable, within given limits, bisymmetric cross-section, is considered. Using Pontryagin's maximum principle, it has been shown that the critical load of a column with variable cross-section may exceed the bounds defined by critical loads for columns with constant extreme cross-section. On the other hand the extreme loads for flexural buckling are the critical ones for columns with extreme constant cross-section. In the numerical example given, the extreme critical loads for simply supported I column with variable width of flanges and corresponding optimal shapes of flanges are the object of analysis. Moreover, it has been shown that these bifurcation points are symmetric and stable. (8 refs.)

71416 On the convection of a cusp in elastic stability. J.M.T.Thompson (Dept. of Civil Engng., Univ. of Coll., London, England).
J. Mech. & Phys. Solids (GB), vol.31, no.3, p.205-22 (1983).
Because of its dominant role in elastic stability, the unstable-symmetric bifurcation, or cusp catastrophe, is worthy of special study. The author presents a systematic perturbation analysis of the cusped imperfection-sensitivity in a general bifurcational context, to examine its movement and deformation under the influence of further imperfection parameters. The elimination of passive coordinates allows explicit expressions to be derived for the horizontal and vertical shifts and the tilting of the primary two-thirds power-law cusp. The results throw new light on the earlier experiments of Roorda (1968), which are re-examined in some detail. Contours of constant failure load in a two-dimensional imperfection space finally allow the worst types of compound imperfection to be identified. (12 refs.)

71417 Three-dimensional theory of inelastic stability (general questions). A.N.Guz', A.N.Sporykhin (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.581-97 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.3-22 (July 1982). [received: March 1983]
Presents a review and generalizing analysis of the presently relevant questions of the three-dimensional theory of inelastic stability (primarily elastic-plastic, complex media and materials with rheological properties), methods of solution, and, on this basis, specific solutions of three-dimensional problems within the framework of both small and finite subcritical deformations. In discussing the stability criteria of inelastic bodies, as well as works dealing with three-dimensional stability theory, a partial analysis is given of the basic works on two-dimensional stability theory, constructed using hypotheses of the plane-cross-section type, Kirchhoff-Love type, etc. In addition, the present review does not include analysis of the results of applying methods of the theory of the stability of motion to problems of the stability of inelastic bodies. (188 refs.)

71418 Modeling the discrete coupling of layers in calculating the stability of a two-layered cylindrical shell. N.P.Semenyuk, N.B.Boiko (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.615-19 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.46-51 (July 1982). [received: March 1983]
Calculates the stability of shells with discretely connected layers using a mathematical model which is based on substitution of the seam connection of the layers with a connection that is continuous over the entire surface. The stability equations in such an approach coincide with the equations for three layered shells. (3 refs.)

71419 Experimental study of the stability of ribbed conical shells. A.S.Pal'chevskii, Yu.A.Sannikov (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.748-52 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.85-9 (Aug. 1983).
The authors theoretically and experimentally study the effect of discrete rib placement in two directions on the stability of thin-walled shells of constant thickness. (6 refs.)

71420 Oscillations of an elastic inhomogeneous strip caused by moving loads. A.V.Belokon.
Appl. Math. & Mech. (USA), vol.46, no.2, p.225-30 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.296-302 (1982).
The problem of the motion of a load on the boundary of an inhomogeneous elastic strip is studied. It is assumed that the load moves at a constant sub-seismic velocity, and a regime of steady harmonic oscillations exists in the moving coordinate system. It is proved that the solution of the problem under consideration can be obtained easily if the solution of the 'appropriate' problem of the oscillations of an inhomogeneous strip is known. Estimates are given of the velocity of the motion and the frequency of the oscillations at which there exists a unique energy solution of the problem. When the oscillations frequency is such that the energy solution does not exist, principles are formulated for extracting the unique solution. (11 refs.)

71421 Oscillations of plates under the action of concentrated loads in an acoustic medium. V.A.Golovanov, A.L.Popov, G.N.Chernyshev.
Appl. Math. & Mech. (USA), vol.46, no.2, p.231-6 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.303-9 (1982).
Steady-state oscillations induced by concentrated forces acting on infinite isotropic and orthotropic plates in contact with a liquid are considered. On the basis of an asymptotic integration of the equations, an approximation method for solving the problem is proposed. Explicit expressions are obtained for the first approximations of an isotropic plate, numerical integration of the equations in an exact formulation is also carried out and a comparison with the approximate analytic solution given. The study makes it possible to break up the initial problem into several simpler problems and to identify the structure of the integrals and simplify the solution method. As a result the authors are able to generalize their method to boundary value problems. A solution of the orthotropic plate problem (which has not previously been considered) is obtained. (9 refs.)

71422 Small oscillations of an orthotropic cylindrical shell containing a liquid covered by rigid endplates. R.A.Marchuk, R.N.Shvets.
Appl. Math. & Mech. (USA), vol.46, no.2, p.237-43 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.310-16 (1982).
The oscillation problem for a Timoshenko-type orthotropic cylindrical shell containing a liquid covered by two movable, rigid endplates is considered. The problem is solved by decomposing the required function in a modified Fourier series. The motion of the shell is described by classical equations, and the shell material itself is assumed to be isotropic. (16 refs.)

71423 Dispersion of nonlinear waves in a rod. V.L.Berdichevskii.
Appl. Math. & Mech. (USA), vol.46, no.2, p.244-9 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.317-23 (1982).
Equations from the linear theory of transverse oscillations of a rod have solutions of the form $e^{i\theta}, \theta=\lambda\xi-\omega t$ if the wave number λ and frequency ω are linked by the dispersion relation $f(\lambda,\omega)=0$. A nonlinear generalization of such solutions and a corresponding dispersion relation is constructed for plane oscillations of an inextensible rod. The basic nonlinear effects, are seen in the fact that the harmonic oscillation $\varepsilon^{i\theta}$ is transformed into an oscillation of the form $\psi(\theta), \theta=\theta(\xi,t)$ where $\psi(\theta)$ is a periodic function of θ_t further in the dispersion relation a dependence on the amplitude of the oscillations arises while the derivatives θ_ξ and θ_t serve as the wave number 'effective' rod characterizing slow mean motion on which rapid oscillations with wave number θ_ξ and frequency θ_t are superimposed. The energy of the effective rod is computed and equations are constructed that describe its evolution. The dispersion relation arises as an equilibrium condition imposed on the effective rod. The author's main purpose is to explain whether the Whitham method in the theory of nonlinear waves is a particular case of the general method of studying functionals that depend upon a small parameter previously proposed. A positive answer to this question is given. (4 refs.)

71424 Dispersion of nonlinear spatial waves in a rod. A.Iu.Beliaev.
Appl. Math. & Mech. (USA), vol.46, no.2, p.250-5 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.324-30 (1982).
A nonlinear generalization of the dispersion equations of three-dimensional oscillations is constructed for an inextensible rod. The dispersion equation is obtained for waves of any amplitude in the closed form, containing a solution of a certain system of two transcendental equations. For small amplitudes the final relationships are given in explicit form, taking into account the nonlinearity in the first approximation. The dispersion relation contains, just as in the linear case, the mean tensile force, the wave number and frequency, as well as the parameters defining the oscillation amplitudes. From the dispersed relation it follows that the larger the oscillation amplitude, the greater the wave velocity. The interaction of the transverse oscillations at different planes, absent in the linear case, is described; the characteristics of the 'effective' rod computed and the corresponding averaged equations constructed. (5 refs.)

71425 The response of ring-stiffened elastic cylindrical shell of infinite length to a transverse shock wave. Yeh Yuh-gong (Inst. of Mech., Acad. Sinica, Beijing, China).
Acta Mech. Solida Sin. (China), no.2, p.208-22 (1981). In Chinese.
A simple, unstiffened uniform circular cylindrical shell is employed as a 'reference structure' and the ring stiffeners treated as 'external' loadings on the uniform shell. Based on the assumption of small perturbation, the coupled effects between the fluid and shell is considered. The real external loading on the shell is the sum of the pressure of the incident shock wave and the scattered waves. In order to avoid the difficulty in the direct inversion of the Laplace transformation, the 'residual potential' method is used. The elastic response of the shell is obtained by a series in terms of all normal modes of

oscillation of the structure, including both the non-extensional and extensional effects in all modes. Calculation was made for two groups of data and curves were drawn from the calculated results, from which some useful conclusions can be reached. The equations derived can be reduced to identical with some equations published by other workers. (11 refs.)

71426 Linearization of the impact of elastic systems. Zhang Wen (Fudan Univ., China).
Acta Mech. Solida Sin. (China), no.3, p.317-25 (1981). In Chinese.
The impact of elastic systems is a complicated nonlinear phenomenon. By an analysis of the fundamental central impact of two elastic solids, the author has demonstrated that this nonlinear impact phenomenon may be linearized, qualitatively and quantitatively, with an equivalent spring and an equivalent initial velocity. Thus, the impact problem of elastic systems may be reduced to an appropriate free vibration initial value problem for a linearized system for which the general solutions are deduced. Numerical examples show that the method proposed is both simple and efficient. (5 refs.)

71427 Vibration analysis of shells of revolution by modal synthesis method. Wang Da-jun, Ren Jun-guo, Chen-Ping (Beijing Univ., Beijing, China).
Acta Mech. Solida Sin. (China), no.3, p.343-51 (1981). In Chinese.
A modal synthesis method is suggested for calculating the natural vibration and seismic response for a shell of revolution. The generator of the shell may be of any form even one consisting of piecewise curves, yet the stiffness and mass matrices of the shell still keep the advantage that they are quasi-diagonal. A computer program and a numerical example illustrating the effectiveness of this method are presented. (2 refs.)

71428 Doubly asymptotic approximations as non-reflecting boundaries in fluid-structure interaction problems. M.Soliman, F.L.DiMaggio (Dept. of Civil Engng. & Engng. Mech., Columbia Univ., New York, NY, USA).
Comput. & Struct. (GB), vol.17, no.2, p.193-204 (1983).
Acoustic approximations are differential relations between induced fluid pressure and velocity in an acoustic medium. The plane wave approximation (PWA) is valid for high frequency response while doubly asymptotic approximations (DAA) are valid at very high and very low frequencies and, in advanced versions, at selected intermediate frequencies. These relations have been applied extensively on the wet surface of submerged structures to completely uncouple the equations of motion of the structure from those of the surrounding fluid. If DAA are used, a different virtual mass matrix and, in the advanced versions, fitting matrices must be evaluated for each structural geometry. The approximations are used on a fluid surface which encloses the structure and has a geometry for which virtual mass and fitting matrices are known. The response is obtained by solving numerically the coupled fluid-structure equations within this approximation to a non-reflecting boundary. A numerical example of the dynamic response of a spheroidal shell is solved using a sphere as the absorbing boundary and the response obtained is compared to exact results. (20 refs.)

71429 A geometrically nonlinear shell finite element for tire vibration analysis. C.J.Hunckler, T.Y.Yang, W.Soedel (Purdue Univ., West Lafayette, IN, USA).
Comput. & Struct. (GB), vol.17, no.2, p.217-25 (1983).
An axisymmetric finite element is developed, which includes such features as orthotropic material properties, doubly curved geometry and both the first and second order nonlinear stiffness terms. This element can be used to predict the equilibrium state of an axisymmetric shell structure with geometrically nonlinear large displacements. Small amplitude vibration analysis can then be performed based on this equilibrium state. The nonlinear path is predicted by using the self-correcting incremental procedure and any point of the path can be checked by using the Newton-Raphson iterative scheme. The present formulation and solution procedure are evaluated by analysing a series of examples with results compared with alternative known solutions. Examples include: free vibration of an isotropic cylindrical shell, a conical frustum, and an orthotropic cylindrical shell; buckling of a cylindrical shell; large deflection of a clamped disk, a spherical cap, and a steel belted radial tire. The final example is a free vibration analysis of the inflated tire and the nature frequencies obtained compared well with published experimental data. (38 refs.)

71430 Optimum design of a first story damping system. M.C.Constantinou, I.G.Tadjbakhsh (Dept. of Civil Engng., Rensselaer Polytech. Inst., Troy, NY, USA).
Comput. & Struct. (GB), vol.17, no.2, p.305-10 (1983).
The optimum design of a first story damping system of multistory shear type structures is considered. Analytical expressions, for the case of stationary white noise ground accelerations, are derived for maximum displacements of each floor. Based on these, suitable objective functions are defined. Parametric study for the determination of the effect of structural damping and structure's flexibility on the second quantities is performed and the optimal design of several structures is carried out. (14 refs.)

71431 Nonlinear supersonic flutter of panels considering shear deformation and rotary inertia. K.Singa Rao, G.Venkatewasara Rao (Aerospace Structures Div., Vikram Sarabhai Space Center, Trivandrum, India).
Comput. & Struct. (GB), vol.17, no.3, p.361-4 (1983).
Nonlinear supersonic flutter of panels is studied for end conditions of simply supported, clamped and partial restraint against rotation by a unified approach. The effect of shear deformation and rotary inertia on nonlinear flutter boundary is studied for various thicknesses of panel. (14 refs.)

71432 Unconditionally stable implicity-explicit algorithms for coupled thermal stress waves. Wing Kam Liu, Ui Fei Zhang (Dept. of Mech. & Nuclear Engng., Northwestern Univ., Evanston, IL, USA).
Comput. & Struct. (GB), vol.17, no.3, p.371-4 (1983).
A new family of unconditionally stable implicit-explicit algorithms for transient coupled thermal stress waves is introduced. Its computer implementation aspects are presented. The mechanical displacement and temperature are used as independent variables and the resulting matrix equations are shown to be symmetric. (12 refs.)

71433 Estimation of the fundamental frequencies of shallow shells by a finite element-isodeflection contour method. D.Bucco, J.Mazumdar (Dept. of Appl. Math., Univ. of Adelaide, Adelaide, South Australia).
Comput. & Struct. (GB), vol.17, no.3, p.441-7 (1983).
A simple, efficient and economic numerical technique for the fundamental frequencies of shallow shells is presented. The technique is based upon the constant deflection contours method combined with the finite element method. In the method, using Galerkin's criterion, the element stiffness and mass matrices are derived from a system of two consistent partial differential equations involving two scalar functions. Several representative examples are included to indicate the efficacy of the method. (20 refs.)

71434 Coupled vibration of a rigid rectangular block bonded to an elastic half-space. Z.Hryniewicz (Tech. Univ. of Koszalin, Koszalin, Poland).
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.37, no.3, p.329-39 (May 1983).
The characteristics of the coupled vertical, horizontal and rocking vibration of the rigid rectangular block bonded to the elastic half-space medium were explored and examained. An approximate analytical solution has been compared with the exact half-space model solution. Depending on the combination of certain parameters (weight, height of the block and force location) the vibrating block may exhibit resonance at three frequencies. In practical cases the response is dominated by the first resonant peak amplitudes. (10 refs.)

71435 On the investigation of axisymmetric oscillations of a multilayer orthotropic cylinder. O.S.Visoven, M.O.Shul'ga.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.4, p.40-2 (1983). In Ukrainian.
A method is suggested to study mechanical properties and natural oscillations of a multilayer hollow cylinder consisting of a finite number of orthotropic layers of different thickness. The method permits the initial boundary value problem to be reduced to an infinite system of recurrence algebraic equations. (4 refs.)

71436 Subharmonic capture of aeroelastic self-oscillations of circular cylinder. M.I.Kazakevich, I.Yu.Grafs'kii.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.4, p.46-8 (1983). In Ukrainian.
Presents results of experimental wind-tunnel investigations on the existence of aeroelastic self-excited oscillation stable regimes in a circular cylinder. The 1/3 subharmonic capture ranges are found at flow velocities which are three-fold of the critical flow velocity for the fundamental capture range. The self-excited oscillation frequencies in the fundamental and subharmonic capture ranges are identical and coincide with the natural frequency of the elastically fixed cylinder model. The Strouhl number is also identical and is nearly Sh-0.2. The experimental dependences of aeroelastic self-excited oscillation amplitudes on the flow velocity and of the ranges of the fundamental and subharmonic captures on the degree of flow turbulence are obtained. (6 refs.)

71437 Diffraction shift of waves in an anisotropic multiply-connected body on elastically symmetric plane. O.S.Kosmodamians'kii, L.V.Obodovs'kii, V.I.Storozhev.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.4, p.48-51 (1983). In Ukrainian.
The solution of a two-dimensional problem on diffraction of a transverse elastic wave polarized in an axial direction on an arbitrary series of parallel cylindrical cavities or inclusions of elliptical section in an anisotropic body with monoclinic symmetry is constructed as a cylindrical functions series, and is reduced to infinite systems of linear algebraic equations. A numerical example is given. (5 refs.)

71438 Bimodal optimization of vibrating shallow arches. N.Olhoff, R.H.Plaut (Dept. of Solid Mech., Tech. Univ. of Denmark, Lyngby, Denmark).
Int. J. Solids & Struct. (GB), vol.19, no.6, p.553-70 (1983).
A bimodal formulation is developed for the problem of maximizing the fundamental vibration frequency of shallow, elastic arches of given span, volume, length, material, and boundary conditions. Arches with different cross-sectional types are considered, and two simultaneous design variables are used, namely the cross-sectional area and arch centerline functions. Results are also presented for arches with circular centerlines. An effective numerical solution procedure based on successive iterations is constructed, and solutions are obtained for clamped arches of different lengths and minimum constraint values for the cross-sectional area. The numerical results show that bimodality of the fundamental vibration frequency of optimized arches is the rule rather than the exception, and that significant increases of the frequency can be achieved. (13 refs.)

71439 Spurious reflection of elastic waves due to gradually changing finite element size. Z.Celep, Z.P.Bazant (Centre for Concrete & Geomaterials, Technol. Inst., Northwestern Univ., Evanston, IL, USA).
Int. J. Numer. Methods Eng. (GB), vol.19, no.5, p.631-46 (May 1983).
Deals with the case when two uniform grids of different element sizes are separated by a transition zone through which the element size varies gradually, either by a geometric progression or by an arithmetic progression. When the ratio of wavelength to the largest element size is as low as 4:1, the spurious wave reflection is very significant, while for the ratios over 10:1 it is insignificant. Inserting a transition zone with gradually varying element size between the two uniform parts of the grid somewhat mitigates the phenomenon of spurious reflection, but this is significant only when the ratio of element sizes in the uniform grids is small. Varying the element size throughout the transition zone in an arithmetic progression seems slightly better than in a geometric progression. The spurious wave reflection is less pronounced for higher-order elements, in particular for linear strain elements as compared to constant strain elements. The spurious reflection is also less severe for consistent mass than for lumped mass. (11 refs.)

71440 On the propagation of a thermoelastic wave at a thin infinite plate immersed in an infinite liquid with thermal relaxation. S.G.Mondal (Dept. of Math., AKPC Mahavidyalaya, Bengal, India).
Indian J. Pure & Appl. Math., vol.14, no.2, p.185-93 (Feb. 1983).
The frequency equations corresponding to a thermo-elastic plane wave in an infinite thermo-elastic plate immersed in an infinite liquid which is kept at a uniform temperature have been obtained for symmetrical and antisymmetrical vibrations about the vertical axis, taking thermal relaxation into account. The equations are expanded in the case when the plate is very thin. The phase velocity-dispersion relations are obtained when the material satisfies Poisson's condition and for given values of the thermal relaxation, coupling parameters; from these the real values of the wave velocity are predicted. (3 refs.)

71441 Non-linear vibrations of a non-isotropic trapezoidal plate. P.Biswas (Dept. of Math., PD Women's Coll., Jalpaiguri, India).
Indian J. Pure & Appl. Math., vol.14, no.2, p.265-9 (Feb. 1983).
Large amplitude free vibrations of a non-isotropic trapezoidal plate with simply-supported edges have been investigated using Berger's approximate quasi-linear differential equations. (11 refs.)

71442 Scattering of elastic waves by a fluid inclusion. B.Peterson, V.K.Varadan, V.V.Varadan (Dept. of Engng. Mech., Ohio State Univ., Columbus, OH, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1487-93 (May 1983).
The scattering of harmonic elastic waves by a bounded fluid inclusion in an infinite elastic continuum is considered. The formalism is an extension of the *T*-matrix method developed for solid inclusions and cavities in elastic media and elastic solid inclusions in fluid media. The problem that is considered here is somewhat more complicated and shares some similarities with the case of an elastic cavity. For the fluid inclusion, however, the scattering amplitudes

display resonance peaks due to interior resonances of the fluid. The convergence of the truncated series is dependent on the largest wavenumber which in the cases studied here is that in the fluid inclusion. Numerical results are presented for a prolate spheroidal inclusion. (12 refs.)

71443 Finite element eigenfunction method (FEEM) for elastic (SH) wave scattering. J.H.Su, V.V.Varadan, V.K.Varadan (Dept. of Engng. Mech., Ohio State Univ., Columbus, OH, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1499-504 (May 1983).
A finite element eigenfunction method (FEEM) is presented for elastic (SH) wave scattering by cylinders of arbitrary cross section. The problem has been analyzed by enclosing the scatterer within an imaginary circular cylinder. The scattered field outside the circular cylinder is expanded in the usual cylindrical harmonics. The nearfield solution inside the circular cylinder is also assumed to be expanded by a series of eigenfunctions. The eigenfunctions for the nearfield are generated through the standard finite element technique by imposing suitable conditions on the circle. Then both the coefficient of the scattered field and those of the nearfield are found by means of a least-square fit for the continuity conditions across the circle. The solution obtained thereby is considered complete in the sense that both the scattered and the nearfield are solved simultaneously. The validity of this method has been verified by comparing results with calculations from exact analysis and the *T*-matrix method for (a) centered circular cylinder, (b) off-centered circular cylinder, (c) elliptical cylinder, and (d) square cylinder. (8 refs.)

71444 Forced motion of a simple frame subjected to a moving force. C.K.Karaolides, A.N.Kounadis (Dept. of Civil Engng., Nat. Tech. Univ., Athens, Greece).
J. Sound & Vib. (GB), vol.88, no.1, p.37-45 (8 May 1983).
The dynamic response of a simple two-member frame subjected to a constant force moving across its girderwith a constant velocity is discussed. After determining the orthogonality condition for the frame as well as its eigenfrequencies and normal modes, one can easily establish the dynamic response of the frame. Dynamic and static influence lines of characteristic displacements and internal forces are assessed for two different velocities of the moving force. Comparisons between dynamic and static solutions indicate that the dynamic effect of the moving load may be considerable. (9 refs.)

71445 Comment on 'Non-linear vibration of circular plates with transverse shear and rotatory inertia' [and reply]. K.Kanaka Raju, G.Venkateswara Rao (Aerospace Structures Div., Vikram Sarabhai Space Centre, Trivandum, India), C.Y.Chia.
J. Sound & Vib. (GB), vol.88, no.1, p.141-2 (8 May 1983).
Kanaka Raju and Venkateswara Rao comment on Chia and Sathyamoorthy's work (see ibid., vol.78, p.131, 1981), stating that they feel they are entitled to a more critical and consistent comparison of their results (presented in ibid., vol.47, p.179, 1976). In reply, Chia states that he believes that the results presented by Kanaka Raju and Venkateswara Rao are correct. (7 refs.)

71446 Free vibrations of an isotropic nonhomogeneous infinite plate of linearly varying thickness. J.S.Tomar (Univ. of Roorkee, Roorkee, India), D.C.Gupta, N.C.Jain.
Meccanica (Italy), vol.18, no.1, p.30-3 (March 1983).
The free transverse vibrations of the plate have been studied on the basis of classical plate theory. The governing differential equation of motion has been solved by Frobenius method by expressing the transverse displacement as an infinite series. The frequencies corresponding to the first two modes of vibration are computed for different values of thickness variation constant, nonhomogeneity parameter, and different combination of boundary conditions. (5 refs.)

71447 Vibration reduction effect by the action of constant force. Y.Iwata, Y.Kobori (Kanazawa Univ., Kanazawa, Japan).
Mem. Fac. Technol. Kanazawa Univ. (Japan), vol.15, no.2, p.73-8 (Nov. 1982). In Japanese.
There are some cases where the amplitude of hard spring systems under harmonic excitations is reduced by the action of a constant force. In order to explain this phenomenon the response of a single-degree-of-freedom system with the restoring characteristics $ky+\beta y^3$ ($\beta>0$), under both the constant force and the harmonic excitation has been investigated, and the mechanism of the vibration reduction has been developed. As a result, it is found that the reasons for the vibration reduction effect by the action of constant force are (1) the increase of the linear spring constant and (2) the change of the resonant characteristics. Some calculation examples of the vibration reduction effect are also included. (5 refs.)

71448 A note on nonlinear elastic wave propagation. H.Cohen, M.Epstein (Dept. of Civil Engng., Univ. of Manitoba, Winnipeg, Canada).
Mech. Res. Commun. (GB), vol.10, no.1, p.37-44 (Jan.-Feb. 1983).
Presents an extremely concise form of the iterated compatibility relations which are readily useful for finding the basic equations for the higher order waves. Their formulation involves an arbitrary choice of coordinates on the singular surface in space-time. The relations are applied to the equations of motion of a nonlinear elastic solid and the basic equations which govern deformation waves of all orders, $n\geq 2$ are obtained. These equations are analyzed wherein both the growth-decay and induced wave equations are extracted from them. The first of these equations is in general a partial differential equation which is linear for waves of all orders, except $n=2$. The later equations are algebraic in nature and give the induced higher order wave associated with a primary wave of order one lower. Finally an algorithm is given for solving problems in nonlinear elastodynamics which utilizes the wave front expansion. (9 refs.)

71449 The influence of mid-plane normal stress and cross section deformation in free vibrating plates. H.Irretier (Inst. fur Mech., Univ. Hannover, Hannover, Germany).
Mech. Res. Commun. (GB), vol.10, no.1, p.53-61 (Jan.-Feb. 1983).
The classical plate-theory, as introduced by Kirchhoff (1850), assumes, in the form of the hypothesis of nondeformable normals, a linear distribution of the in-plane deformation across the thickness of the plate and also neglects the influence of normal stresses with respect to the middle-plate surface. The influence, in the sense of two-dimensional plate theory, of the in-plane displacements and normal stresses (the secondary effects) on the eigenfrequencies, eigenforms and stress distributions are investigated. For this purpose a simply supported, free vibrating plate is considered by inserting double Fourier series solutions into the different plate equations and then solving these using a Newton-Raphson iteration method. (7 refs.)

71450 Torsional wave propagation in a finite inhomogeneous cylindrical shell under time-dependent shearing stress. K.Venkateswara Sarma (Dept. of Maths., PSG Coll. of Arts & Sci., Coimbatore, India).
Proc. Indian Acad. Sci. Math. Sci., vol.91, no.3, p.201-10 (Nov. 1982). [received: May 1983]
Torsional wave motion in a finite hollow cylinder of piezoelectric material of (622) crystal class, under a time-dependent mechanical boundary condition, is investigated. The inhomogeneity is restricted to the variations of density and other physical constants of the medium as a certain power of the radial distance. The expressions for the displacement and the electric potential of the present solution are compared with those under time-dependent electric boundary condition. Numerical values of the roots of the frequency equation for β-quartz are presented. (4 refs.)

71451 Dynamic stability of smooth cylindrical shells. V.N.Baskakov, A.I.Kostoglotov, L.A.Shevtsova.
Strength Mater. (USA), vol.14, no.5, p.602-5 (May 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.5, p.31-3 (May 1982). [received: May 1983]
Experimental studies are presented of the effect of internal static pressure and loading rate on the stability of smooth cylindrical shells loaded by an external pressure pulse. It is found that internal pressure significantly increases the critical load associated with the loss of shell stability, this relation being nonlinear. An increase in loading rate also increased the dynamic load factor. (5 refs.)

71452 Forced vibrations of piecewise-nonhomogeneous regular medium with spherical cavity. N.A.Shul'ga, A.I.Yamkovoi, A.P.Vishtak (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.597-601 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.23-8 (July 1982). [received: March 1983] (5 refs.)

71453 Propagation of axisymmetric displacement waves in a layered cylindrical shell. L.P.Khoroshun, S.V.Kozlov, Yu.A.Ivanov (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.611-15 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.41-5 (July 1982). [received: March 1983]
Using the more exact relations of elasticity and taking into account terms of order 2h/r, the authors solve the problem of axisymmetric wave propagation in a two-layered cylindrical shell. (10 refs.)

71454 Energy characteristics of interference effects in an elastic space and half-space. V.V.Meleshko (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.637-41 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.73-9 (July 1982). [received: March 1983]
Studies the effect of the type of mechanical load on the energy characteristics of harmonic wave motions in infinite and semiinfinite spaces. (15 refs.)

71455 Free and forced vibrations of a circular ring of high curvature. V.Ya.Gecha, E.L.Poznyak (All-Union Sci.-Res. Inst. of Electromech., Moscow, USSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.641-4 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.80-3 (July 1982). [received: March 1983]
Studies both the free and forced in-plane vibrations of a ring of high curvature, with inclusion of the forces of internal friction in the material. Some experimental results are cited. (8 refs.)

71456 Influence of the magnetic field on the phase velocities of surface and volume waves in a perfectly conducting regular layered medium. N.A.Shul'ga (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.693-9 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.28-34 (Aug. 1983).
Magnetoelastic waves in a perfectly conducting regular layer unlimited medium formed by the alternation of two layers of different thicknesses and physicomechanical properties were studied in low- and high-frequency approximations for the case of wave propagation normal to the interfacial planes of the layers (L.Ya. Kosachevskii, 1969). Underlying the investigation was the method of describing the magnetoelastic waves, in nonferromagnetic media, which is also used in the present work, and the Floquet theorem for equations with periodic coefficients. A quantitative analysis of the influence of the magnetic field on the phase velocities of Love surface waves and volume waves in a broad range of frequency variation is performed. (6 refs.)

71457 Analysis of the vibrations of a circular cylinder excited kinematically at the ends. V.T.Grinchenko, G.L.Komissarova (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.699-75 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.35-41 (Aug. 1983). (7 refs.)

71458 Action of weak shock waves on a membrane separating two acoustic half-spaces. V.D.Kubenko, Yu.B.Moseenkov (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.705-11 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.42-8 (Aug. 1983).
If a shell structure immersed in a compressible liquid has large dimensions, and a source of unsteady perturbations is found near its surface, then the interaction can be investigated, considering the problem of the action of a shock wave on an elastic plate or membrane bounding a half-space of a compressible liquid. In this case, it is assumed that the material of the plate has some conditional elastic limit, and in the transition through this limit the plate can be considered as a membrane with tension T equal to the yield stress. The authors consider the action of spherical and cylindrical shock waves on an infinitesimally thin membrane separating two acoustic half-spaces. (9 refs.)

71459 Approximate representation of dissipation function in case of linear viscoelasticity with variable-amplitude vibrations. I.K.Senchenkov (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.719-26 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.56-62 (Aug. 1983).
For linear viscoelastic materials with sufficiently fast relaxation, also for vibrations with sufficiently smooth and slowly varying amplitude, the equation for stress can be approximated in the asymptotic sense with differential equations for amplitude. In this study, the author obtains, on the same premise, the corresponding approximation of the dissipation function averaged over a vibration period for the case of linear viscoelasticity and proposes several simplified models. 46.30N Fracture mechanics, fatigue, and cracks

71460 Overload retardation models of fatigue crack growth. Huang Yu-shan, Liu Xue-hui, Ni Hui-lin (Northwestern Polytech. Univ., China).
Acta Mech. Solida Sin. (China), no.2, p.257-68 (1981). In Chinese.
Eight overload retardation models of fatigue crack growth are reviewed. Their basic principles are treated and physical concepts explained in detail. A comparison has been made between the eight models with respect to the retardation mechanism, performance and ability to explain a variety of retardation phenomena. It is the authors' view that the Wheeler model can be conveniently used and the Matsuoka model has a clear physical meaning. Comments on the application of the retardation models in the estimation of fatigue crack propagation life and in research on retardation phenomena are also made. (19 refs.)

71461 The stress field near the blunt crack tip. Kuang Zhen-bang (Xian Jiaotong Univ., China).
Acta Mech. Solida Sin. (China), no.3, p.358-64 (1981). In Chinese. (4 refs.)

71462 An elastic-plastic solution for two-dimensional cracked body with finite element method. Zhang Xia-ti (Inst. of Mech., Acad. Sinica, Beijing, China).
Acta Mech. Solida Sin. (China), no.3, p.365-73 (1981). In Chinese. (3 refs.)

71463 A strange convergence property of the Lobatto-Chebyshev method for the numerical determination of stress intensity factors. N.I.Ioakimidis (School of Engng., Univ. of Patras, Patras, Greece).
Comput. & Struct. (GB), vol.17, no.2, p.205-9 (1983).
The Lobatto-Chebyshev method for numerical solution of the Cauchy type singular integral equation of crack problems in two-dimensional elasticity, plates and shells and the determination of the values of the stress intensity factors at the crack tips, is shown to converge for nondifferentiable Holder-continuous or even discontinuous loading distributions as far as the values of the stress intensity factors are concerned. In all cases of differentiable loading distributions it is shown to converge more rapidly than believed up to now. The problems of a simple straight crack and a periodic array of cracks loaded by three nondifferentiable loading distributions are used for the application of the present results. Numerical results for these problems verify and further corroborate the theoretical results. (19 refs.)

71464 Quarter-point elements for curved crack fronts. C.Manu (Structural Analytical Div., Sargent & Lundy, Chicago, IL, USA).
Comput. & Struct. (GB), vol.17, no.2, p.227-31 (1983).
Ingraffea et al. (1980) have presented a consistent method to compute stress-intensity factors from wedge quarter-point element nodal displacements for the straight crack front. The method was generalized to permit functional evaluation of stress-intensity factors along the crack front. The method is now generalized for curved crack fronts. (7 refs.)

71465 Elasto-plastic stress analysis and fatigue life prediction of a freight car wheel under mechanical and cyclic thermal loads. T.J.Thomas, S.Nair (Illinois Inst. of Technol., Chicago, IL, USA), V.K.Garg.
Comput. & Struct. (GB), vol.17, no.3, p.313-20 (1983).
The elastoplastic finite element analyses of a 36 in. diameter freight car wheel, subjected to cyclic thermal loads in presence of mechanical loads and cyclic mechanical loads in presence of thermal loads, were conducted. The stresses and strains computed for these loading conditions were then used to predict the fatigue life of a wheel subjected to a random load history. (35 refs.)

71466 A variable power singular element for analysis of fracture mechanics problems. G.H.Staab (Engng. Mech., Ohio State Univ., Columbus, OH, USA).
Comput. & Struct. (GB), vol.17, no.3, p.449-57 (1983).
A variable power displacement formulated singular element is developed. The stress and displacement fields within the element are expressed in terms of singular and regular components. The singular components of these fields provide a more accurate representation of the singularity than the total field solutions. The problem of a crack terminating at a bimaterial interface is solved for two extreme ratios of singular element radius to crack length. The solution shows that accurate results can be achieved for either case. (15 refs.)

71467 Role of geometry in plastic instability and fracture of tubes and sheet. M.G.Stout, S.S.Hecker (Materials Sci. & Technol. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Mech. Mater. (Netherlands), vol.2, no.1, p.23-31 (April 1983).
Conditions for plastic instability and fracture for biaxially loaded tubes are compared to those for a sheet to assess the role of geometry. Thin-walled tubes of 70-30 brass were loaded in combined axial tension-internal pressure. The strains for diffuse instability, local instability and fracture were measured and compared to results on brass sheet. Uniform deformation (up to diffuse instability) was found to be very sensitive to geometry in agreement with theory. The uniform strain in tubes for axial plane strain is twice that for hoop plane strain and the uniform strain in tubes for balanced biaxial tension is only one third of that for sheet. The strain levels for local instability and fracture did not depend on geometry. No significant differences were found for axial vs. hoop loading in tubes and the critical strain levels for tubes were actually somewhat greater than those for sheet. Although the critical local strains are similar, the amount of useful (general) deformation beyond diffuse instability for tubes is very limited because localization occurs rapidly. If the sheet bulges or is punched the geometry is stable and localization occurs gradually, providing significant post-uniform deformation. (32 refs.)

71468 Effect of microstructure on the upper and lower limits of material toughness in elastic-plastic fracture. M.P.Wnuk, T.Mura (Dept. of Civil Engng., Northwestern Univ., Evanston, IL, USA).
Mech. Mater. (Netherlands), vol.2, no.1, p.33-46 (April 1983).
Provides some quantitative relations linking the two bounds of fracture toughness, the lower (K_{ini}) and the upper (K_{ss}), with certain microstructural parameters, such as relative inclusion volume, grain size, average microvoid spacing, average radius of an activated inclusion, number of inclusions contained within the process zone associated with a quasi-static crack, etc. Two limits of material behavior, brittle and ductile, are discussed. Both limits are derived from a single mathematical model which employs the D-BCS concept of 'line plasticity' as developed for a stationary crack, but extends its range of validity onto a moving crack situation. Only the quasi-static limit of motion is considered. (29 refs.)

71469 Dynamic fields near a crack tip growing in an elastic-perfectly-plastic solid. Y.C.Gao, S.Nemat-Nasser (Dept. of Civil Engng., Northwestern Univ., Evanston, IL, USA).
Mech. Mater. (Netherlands), vol.2, no.1, p.47-60 (April 1983).
A complete asymptotic solution is given for the fields in the neighborhood of the tip of a steadily advancing crack in an incompressible elastic-perfectly-plastic solid. For Mode I crack growth in the plane strain condition, the following noteworthy results are revealed: (1) The entire crack tip in steady crack growth is surrounded by a plastic region, and no elastic unloading is predicted by the complete dynamic asymptotic solution. (2) Unlike the quasi-static solution, the dynamic solution yields strain fields with a logarithmic singularity everywhere near the crack tip. (3) The stress field varies throughout the entire crack tip neighborhood, but does display behavior which can be approximated by a constant field followed by an essentially centered-fan field and then by another constant field, especially for small crack growth speeds. (4) There are two shock fronts emanating from the crack tip across which certain stress and strain components undergo jump discontinuities. Finally, the Mode III steady-state crack growth is reviewed and, on the basis of Mode I and Mode III results, it is concluded that ductile fracture criteria for nonstationary cracks must be based on solutions which include the inertia effects. (18 refs.)

71470 On statistical moments of fatigue crack propagation. Y.K.Lin (Dept. of Aeronautical & Astronautical Engng., Univ. of Illinois, Urbana-Champaign, Urbana, IL, USA), J.N.Wang.
Eng. Fract. Mech. (GB), vol.18, no.2, p.243-56 (1983).
A new statistical theory is proposed for the analysis of fatigue crack propagation, based on the concepts of fracture mechanics and random processes. Focus is centered on conceivably more useful information of the random time at which the crack size grows to any specific value. Given an initial crack size, recursive relationship is obtained for the statistical moments of this random time for a rather general class of material behaviors, and examples are given for the case where the crack propagation rate is governed by a power law. A procedure to estimate the parameters in the power-law model is also illustrated, using the experimental data of some 7475-T7351 aluminum fastener hole specimens subjected to the excitation of a certain bomber load spectrum. (26 refs.)

71471 On life behavior under spectrum loading. F.Kozin, L.Bogdanoff (Dept. of Electrical Engng. & Computer Sci., Polytechnic Inst. of New York, Farmingdale, NY, USA).
Eng. Fract. Mech. (GB), vol.18, no.2, p.271-83 (1983).
B-models are used to study life in cumulative damage under spectrum loading. The basic elements of scatter in sample cdf's, mean cdf, methods of testing and load interaction are delineated and examined in some detail. Application to one set of life data under spectrum loading is considered. Stationary and nonstationary *B*-models of life under spectrum loading are discussed. (15 refs.)

71472 On the symmetric dynamic fracture of a beam under tensile loading. C.Levy, G.Herrmann (Dept. of Mech. Engng., Stanford Univ., Stanford, CA, USA).
Eng. Fract. Mech. (GB), vol.18, no.2, p.295-304 (1983).
The dynamic fracture response of a long beam of brittle elastic material under tensile loading is studied by means of two different one-dimensional models. If the magnitude of the applied loading is increased quasi-statically to a critical value, two coplanar edge cracks are assumed to propagate across the beam's cross section. The first model parallels that of Freund et al. (see J. Appl. Mech., vol.43, p.112-6, 1976) with the crack length, crack speed and the loading on the fracturing section being determined as functions of time after fracture initiation. The second model is derived by means of energy considerations in the vicinity of the fracturing section. The results obtained from both models are similar except during the final phase of the fracture process. (13 refs.)

71473 Partial closure of cracks at the interface between a layer and a half space. M.Comninou (Dept. of Civil Engng., Univ. of Michigan, Ann Arbor, MI, USA), J.Dundurs.
Eng. Fract. Mech. (GB), vol.18, no.2, p.315-23 (1983).
Treats the crack at the interface between a layer and a substrate. Using a formulation based on dislocations, the problem is reduced to a pair of singular integral equations which can be solved numerically. It is found that a large contact zone exists whenever the interface transmits shear. The dependence of the contact zone size on the load parameters is determined for several combinations of materials. Also the shapes of the open part of the crack are shown for illustration. (17 refs.)

71474 Prediction of failure probabilities for cleavage fracture from the scatter of crack geometry and of fracture toughness using the weakest link model. A.Bruckner (Kernforschungszentrum Karlsruhe, Karlsruhe, Germany), D.Munz.
Eng. Fract. Mech. (GB), vol.18, no.2, p.359-75 (1983).
The weakest link model proposed by Landes and Shaffer (see Fracture Mechanics 12th Conf., ASTM STP 700, p.368-82, 1980) is generalized in order to predict the failure probabilities of real structures with surface cracks and to include the scatter in crack size and crack geometry. The failure probabilities and the distributions of crack depth, of depth to length ratio and of fracture toughness of the failed structures are calculated in this model and compared with the results of the usual probabilistic calculations. (12 refs.)

71475 Sudden twisting of an external circular crack in an infinite medium with a cylindrical inclusion. R.S.Dhaliwal, B.M.Singh (Dept. of Math. & Statistics, Univ. of Calgary, Calgary, Alberta, Canada), J.Vrbik.
Eng. Fract. Mech. (GB), vol.18, no.2, p.417-26 (1983).
The torsional impact response of an external circular crack in an infinite medium bonded to a cylindrical inclusion has been investigated. The infinite medium and cylindrical inclusion are assumed to be of different homogeneous isotropic elastic materials. Laplace and Hankel transforms are used to reduce the problem to the solution of a pair of dual integral equations. These equations are solved by using an integral transform technique and the results are expressed in terms of a Fredhol integral equation of the second kind. By solving Fredholm integral equation of the second kind the numerical results for the dynamic stress-intensity factor are obtained which measure the load transmission on the crack. (7 refs.)

71476 Tabulated stress intensity factor solutions for flawed fastener holes. A.F.Grandt,Jr. (School of Aeronautics & Astronautics, Purdue Univ., W Lafayette, IN, USA), T.E.Kullgren.
Eng. Fract. Mech. (GB), vol.18, no.2, p.435-51 (1983).
Several sets of stress intensity factor solutions are provided for through-the-thickness, corner and surface flawed holes. Results are given for both remote tensile and crack face pressure loading. It is suggested that the crack free pressure solutions can be used with the linear superposition method to analyze many other practical crack problems. The superposition technique is demonstrated with several sets of example calculations. (28 refs.)

71477 Fracture mechanics deliberation of lugs. A.Li, D.W.Hoeppner (Cockburn Centre for Engng. Design, Univ. of Toronto, Toronto, Canada).
Eng. Fract. Mech. (GB), vol.18, no.2, p.467-71 (1983).
Mode I stress intensity factors for a symmetrical lug with a through radial crack emanating from the integral boundary were evaluated with finite element techniques. A new geometric configuration was developed which saves a minimum of 60% in computer time over the traditional configuration. The effect of interference fit and slip fit was investigated by comparing the results

obtained for two different loading conditions; point force and uniform bearing pressure distribution, of which, pin loading yields the larger stress intensity factor. A means of estimating the residual life is also presented. (10 refs.)

71478 The weight function for various boundary condition problems. A.P.Parker (Dept. of Mech. & Civil Engng., North Staffordshire Polytech., Stafford, England), O.L.Bowie.
Eng. Fract. Mech. (GB), vol.18, no.2, p.473-7 (1983).
The familiar weight function '*m*' of Bueckner (1970) and Rice (1972) which is unique to a given cracked geometry may be employed in the determination of stress intensity factors with stress boundary conditions applied to the geometry. There also exists an additional weight function '*m**', also unique to a given gracked geometry, which may be employed in the derivation of stress intensity factors with displacement boundary conditions applied to portions of the geometry. Weight functions '*m*' and '*m**' may be derived simultaneously with an arbitrary crack-line loading. The weight function '*m*' permits the recovery of displacements for a new set of stress boundary conditions, whilst '*m**' permits the recovery of stress for a new set of displacement boundary conditions. In using '*m*' and '*m**' to recover additional information, it is important to recognize the functional dependency of stress intensity on crack length. (7 refs.)

71479 Brittle fracture of plates in tension—relative significance of boundary reflected body and Rayleigh waves. B.Q.Vu (Naval Ocean Systems Center, San Diego, CA, USA), V.K.Kinra.
Eng. Fract. Mech. (GB), vol.18, no.2, p.479-83 (1983).
Large SEN-specimens made of PMMA have been subjected to tensile fracture in a run-arrest mode. The dynamic strain at a point on the crack face was measured for very long times. The amplitudes of the boundary-reflected Rayleigh and longitudinal (plate) waves were found to be roughly equal. On the basis of the fact that in plane elastodynamic problems, the body waves attenuate due to cylindrical expansion, while the Rayleigh waves do not, it has been conjectured in the literature that in experiments involving dynamic crack propagation and/or arrest, the boundary-reflected body waves can be neglected relative to the Rayleigh wave. The authors' experiments show that in the present situation this conjecture is not true. (19 refs.)

71480 Punch and crack problems in transversely isotropic bodies. T.S.Sankar, V.I.Fabrikant (Dept. of Mech. Engng., Concordia Univ., Montreal, Quebec, Canada).
Int. J. Eng. Sci. (GB), vol.21, no.7, p.799-811 (1983).
An exact solution is proposed for the mixed boundary-value problem in a transversely isotropic elastic half-space. Certain arbitrary shear tractions are prescribed inside a circular region, outside of which certain arbitrary tangential displacements are given. The normal stresses are supposed to be known all over the boundary. A particular case is considered, in detail, where normal stresses vanish all over the boundary with the shear tractions vanishing inside the circular region. A closed form expression is obtained for the tangential displacements inside the circular region directly through the displacements outside. As an example, a penny-shaped crack in an infinite transversely isotropic body is considered with arbitrary shear tractions acting on both sides of the crack. The formulae for the tangential displacements inside the circle and the shear stresses outside are obtained. Special cases where uniform shear and a concentrated tangential force arise are also discussed. (5 refs.)

71481 How 'mixed' is dynamic mixed-mode crack propagation?—a dynamic photoelastic study. H.P.Rossmanith (Inst. of Mech., Tech. Univ. Vienna, Vienna, Austria).
J. Mech. & Phys. Solids (GB), vol.31, no.3, p.251-60 (1983).
Dynamic photoelastic fringe recordings associated with rapid curved crack propagation, crack divison and the interaction between moving cracks and elastic waves show global dynamic mixed-mode crack-tip fringe patterns. When analysed by means of *K*-determination procedures an 'apparent' dynamic mixed-mode ratio K_2/K_1 may be defined which turns out to be a function of the particular selection of measurement data points. Experimentally recorded fringe data are compared with numerical results in an attempt to resolve the dynamic photoelastic mixed-mode crack problem. (11 refs.)

71482 Transient thermal stress problem for a circumferentially cracked hollow cylinder. H.F.Nied, F.Erdogan (Lehigh Univ., Bethlehem, PA, USA).
J. Therm. Stresses (USA), vol.6, no.1, p.1-14 (Jan.-March 1983). [received: May 1983]
Considers the transient thermal stress problem for a hollow elastic cylinder containing an internal circumferential edge crack. It is assumed that the problem is axisymmetric with regard to the crack geometry and the loading, and that the inertia effects are negligible. The problem is solved for a cylinder that is suddenly cooled from inside. First the transient temperature and stress distributions in an uncracked cylinder are calculated. By using the equal and opposite of this thermal stress as the crack surface traction in the isothermal cylinder the crack problem is then solved and the stress intensity factor is calculated. The numerical results are obtained as a function of the Fourier number tD/b^2 representing are obtained as a function of the Fourier number tD/b^2 representing the time for various inner-to-outer radius ratios and relative crack depths, where D and b are respectively the coefficient of diffusivity and the outer radius of the cylinder. (10 refs.)

71483 A crack-tip strain model for the growth of small fatigue cracks. K.S.Chan, J.Lankford (Southwest Res. Inst., San Antonio, TX, USA).
Scr. Metall. (USA), vol.17, no.4, p.529-32 (April 1983).
The model is based upon the concept of greater plastic strain, hence crack-tip opening, at the tips of small cracks, which is compatible with their observed rapid growth in comparison with equivalent long cracks. The reduction of crack-tip strain at grain boundaries accounts for transient decelerations in microcrack growth rates. However, for similarly oriented crystallites, the model predicts little or no deceleration, hence nothing resembling a threshold. Some of the data support this result. This would suggest that the concept of the threshold may be invalid insofar as small cracks are concerned. (12 refs.)

71484 Stress system in a plate with a crack under biaxial load. E.E.Onishchenko (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.5, p.611-14 (May 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.5, p.39-42 (May 1982). [received: May 1983]
The problem of the stress system in a biaxially loaded infinite plate with a crack was solved for a wide range of loads. The comparison of the lines of equal maximum tangential stresses obtained experimentally on a cross-shaped photoelastic model with the data theoretically calculated for an infinite plate made possible the evaluation of the proximity of the stressed state in a specimen working part and in the corresponding region of the infinite plate under various biaxial load parameters. (3 refs.)

71485 Thermodynamics of the propagation process of quasibrittle cracks. Sh.Kh.Khannanov (Acad. of Sci., Ufa, USSR).
Strength Mater. (USA), vol.14, no.5, p.620-4 (May 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.5, p.46-50 (May 1982). [received: May 1983]
The author obtained explicit expressions for entropy production and excess entropy production connected with the propagation of quasibrittle cracks. A phenomenological correlation for the speed of crack propagation is derived. (5 refs.)

71486 Elliptical crack under the action of shearing stresses of polynomial form. A.N.Borodachev (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.645-8 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.84-7 (July 1982). [received: March 1983]
On the basis of the use of certain results of potential theory for an elliptical disc the author develops a general law for the variation of the stress intensity factors K_2 and K_3 along the elliptical boundary of a crack in the case when the shearing stresses acting on the crack surfaces are determined by polynomials of arbitrary degree. 46.30P Friction, wear, adherence, hardness, mechanical contacts

71487 A longitudinal impact of a slender viscoelastic bar. M.Jilek (Dept. of Phys., Tech. Univ. of Prague, Praha, Czechoslovakia).
Acta Tech. CSAV (Czechoslovakia), vol.28, no.1, p.109-28 (1983).
An analytical solution to the impact of a slender cylindrical bar made from a viscoelastic material upon a stiff half-space is presented. The material in question is supposed to be represented by a generalized Maxwell model; concrete calculations referring to time- and co-ordinate-dependences of deflections, velocities, strains and stresses are processed for a doubled Maxwell model. Quantification of dependences is carried out for two materials with a different viscous influence and also comparison with an elastic case is presented. The analysis confirmed typical viscoelastic features of behaviour of material as e.g. dispersion, decrease of a pulse wave front slope decrease of maximum values of stress and so on. Another less known aspect of the model of a viscoelastic material was shown, namely its filtering properties. The solution can also be applied to other models of viscoelastic materials having a equal form of the relaxation function as the generalized Maxwell model. (9 refs.)

71488 Solution of contact problems with known Green's function. A.S.Kravchuk.
Appl. Math. & Mech. (USA), vol.46, no.2, p.214-18 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.283-8 (1982).
An iteration algorithm is proposed for solving contact problems with a previously unknown contact zone by taking account of friction in the contact zone, when the adhesion and slip zone interface is also unknown. Stability of the algorithm is investigated, and examples are presented. (10 refs.)

71489 An analysis of coupled thermal-elastic contact problems with the finite element method. Chen Wan-ji (Engng. Mech. Res. Center, Polytech. Inst. of Dalian, China).
Acta Mech. Solida Sin. (China), no.3, p.326-36 (1981). In Chinese.
In the analysis of thermal load in heated elastic bodies contacting each other, it is necessary to consider the complex contact heat conducting condition as well as the elastic contact condition besides taking into account the coupling effect. A very effective approach—the mixed finite element method—is proposed. The calculated results show that to solve such a class of problems with complex nonlinear boundary conditions by this method, the calculating and storing time is slightly longer than or equal to that when solving thermal load problems of general linear continuous bodies. (9 refs.)

71490 A finite surface element model for two concentric nearly circular rings in partial contact. H.A.Francis (Charles Stark Draper Lab. Inc., Cambridge, MA, USA).
Comput. & Struct. (GB), vol.17, no.2, p.169-76 (1983).
A numerical model is derived for the plane-stress elastic deformation of two concentric hollow cylinders with acircular contact surfaces. Given the detailed undeformed section geometry, the model computes the circumferential distributions of interfacial pressure and gap, and the distortion of the two free surfaces. The interface is partitioned into axial strip elements with radial displacement nodes at their boundaries and a piecewise linear pressure distribution from node to node. Influence coefficients linearly relating nodal displacements to nodal pressures are computed using a finite Fourier series expansion of the pressure distribution in conjunction with exact expressions for the deformation of a sinusoidally loaded thick ring. The iterative solution of the nonlinear system of node equations entails computing the currently nonzero nodal pressures by matrix inversion and then updating the contact/gap configuration. The model is demonstrated for a 400 node, mul-

tiple-contact interface between a machined shaft and sleeve with measured acircularity profiles. (4 refs.)

71491 Contact problem for an elastic ring pressed into a circular hole in an isotropic plate. M.I.Teplyi (Drogobych Pedogogical Inst., USSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.625-31 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.58-65 (July 1982). [received: March 1983]
Examines an infinite isotropic plate S_1 of unit thickness. The plate contains a circular hole of radius R_3 into which has been pressed an elastic concentric ring S_0 with internal R_0 and external R_1 radii. It is assumed that the ring is in contact with the plate over the entire contour of the hole before and after application of the load. An elastic cylinder S_2 of radius R_2, inserted in a small gap ϵ in the hole in the annular region, is in contact with the inner surface of the ring, and a concentrated force P_0 is applied to the center of the cylinder and presses it against the inner boundary of the ring. Friction between the ring, plate, and cylinder is ignored. (5 refs.)

71492 An approximate method for the solution of some two-body contact problems with creep in the case of an unknown contact area. B.A.Galanov (Inst. of Materials Study, Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.711-18 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.49-55 (Aug. 1983).
The three-dimensional contact problem of linear creep theory is discussed. The time-dependent contact problem of ordinary elasticity theory is used to determine the contact pressure, the contact area, and the proximity of the objects in the case of creep. This problem has been solved by the method of successive approximations. The convergence of the method is shown by examples of the contact of pyramidal objects with a half-space. (17 refs.)

71493 Effect of surface roughness on the stress-strain state of rubbing bodies. E.A.Kuznetsov (Inst. of Chem. of High-Molecular-Weight Compounds, Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.757-62 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.95-101 (Aug. 1983).
The problem consisted of determining the active working layer in which the basic perturbations caused by roughness are concentrated and establishing the factors which have a predominant effect on the thickness of this layer. The frictional forces which arise on the contact sections are particularly examined. (15 refs.)

71494 An experimental study of three-body abrasive wear. A.Misra, I.Finnie (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).
Wear (Switzerland), vol.85, no.1, p.57-68 (15 Feb. 1983).
Three-body abrasive wear has been studied using a column of abrasive contained in a tube and pressed against a rotating metal disc. The weight loss of the disc owing to abrasion was examined as a function of the length of the wear path, load, speed, abrasive size, abrasive hardness, metal hardness and temperature. Scanning electron microscopy was used to investigate the mechanism of material removal. Similarities and differences between three-body abrasion tests and two-body abrasion results are pointed out. (5 refs.)

71495 Some aspects of post-yield contact problems. D.A.Hills (Dept. of Mech. Engng., Trent Polytech., Nottingham, England).
Wear (Switzerland), vol.85, no.1, p.107-19 (15 Feb. 1983).
The mechanics of contact between a frictionless ball and a semi-infinite block of material are well known when the resulting deformation is wholly elastic. If a sufficiently heavy load is imposed, some material will enter the plastic regime and there will be a redistribution of the contact pressure. The nature of the resulting and residual stress field after both single and repeated loadings is discussed. It is shown that in each case a residual tensile stress develops normal to the surface and a residual compressive stress lies parallel to the plane of the surface. A comparison is made between the form of the residual stresses calculated on the basis of rigid plastic behaviour (using the slip line field theory) and on the basis of incremental plasticity (under the assumption that the extended elastic stress field dominates the problem). An extension to the problem is considered involving the repeated random indentation of a block: this models approximately the shot-peening process, and enables the resulting residual stresses to be quantified. (18 refs.)

71496 The accuracy of plane strain models for the elastic contact of three-dimensional rough surfaces. H.A.Francis (Charles Stark Draper Lab. Inc., Cambridge, MA, USA).
Wear (Switzerland), vol.85, no.2, p.239-56 (1 March 1983).
Two finite surface element models for elastic contact (a general model employing a two-dimensional lattice of deflection nodes on the interface and a previously derived plane strain model using a one-dimensional line of nodes) are compared for a set of interfaces between deterministic rough surfaces to assess the minimum degree of topographical anisotropy for which the considerably more convenient one-dimensional model can confidently be used to predict the pressure and gap profiles along a lone perpendicular to the anisotropy direction. The sum of the two contacting surfaces comprises an array of identical sinusoidal peaks and valleys, of peak-to-valley height $2H$, elongated in the y direction by an anisotropy factor α. For a given sum surface and load, the two-dimensional model gives the 'true' pressure of gap at each node, from which are computed, for each node row in the x direction, the mean pressure P, the contact length fraction F and the mean gap G. The one-dimensional model is then applied to each node row to computer F and G for this value of P, and the deviation of the one-dimensional model from the two-dimensional model is expressed as the average differences in F and G/H averaged over all node rows. (see also 07.10 Mechanical instruments and techniques, 81.70 Materials testing)

71497 The whole-field analysis of speckle interferometry for displacement and strain analysis. Jin Guan-chang, Zhang Wei-bao, Liu Chun-yang (Dept. of Engng. Mech., Tsinghua Univ., China).
Acta Mech. Solida Sin. (China), no.2, p.223-34 (1981). In Chinese.
A whole-field analysis method of laser speckle interferometry for displacement and strain analysis is described. Three new methods of laser speckle photography, namely, cross-like slotted aperture, rectangular multi-aperture and rotated or displaced aperture methods are proposed. Results of the theoretical analysis and experimental demonstrations of these methods show that the adoption of these methods in laser speckle photography results in a wide filtering range and at the same time a very strong viewing intensity during whole-field analysis, making it possible to obtain a clear and variable sensitivity of the displacement field distribution diagram similar to a holographic interferogram. This will certainly pave the way for speckle interferometry application and make whole-field analysis more practical. (6 refs.)

71498 Photoelastic determination of stress intensity factors in patched cracked plates. A.Subramanian, R.Chandra, M.V.V.Murthy, A.K.Rao.
Eng. Fract. Mech. (GB), vol.18, no.2, p.305-13 (1983).
The influence of patch parameters on stress intensity factors in edge cracked plates is studied by employing transmission photoelasticity. Edge cracked plates made of photo-elastic material are patched on one side only by *E* glass-epoxy and carbon-epoxy unidirectional composites. The patch is located on the crack in such a way that the crack tip is not covered. Magnified isochromatic fringes are obtained by using a projection microscope of magnification 50, converted into a polariscope. Irwin's method is used to compute stress intensity factors from photoelastic data. The reduction in stress intensity factors is presented in graphical form as a function of patch parameters, namely stiffness, location and length. An empirical equation connecting reduction in stress intensity factor and these patch parameters is presented. (16 refs.)

71499 Extrapolation techniques for determining stress intensity factors. W.C.Carpenter (Dept. of Civil Engng. & Mech., Univ. of South Florida, Tampa, FL, USA).
Eng. Fract. Mech. (GB), vol.18, no.2, p.325-32 (1983).
A theoretical basis is developed for the extrapolation technique of Chan, Tuba and Wilson (1970) and Ayres and Siddall (1970) for determining stress intensities from finite elemental results. The conditions for which the technique is valid is presented for the Mode I only, Mode II only, and mixed mode condition. (7 refs.)

71500 On the electrical potential analysis of a cracked fracture mechanics test specimen using the finite element method. W.K.Wilson (Westinghouse Res. & Dev. Center, Pittsburgh, PA, USA).
Eng. Fract. Mech. (GB), vol.18, no.2, p.349-58 (1983).
The use of the finite element method to calculate electrical potential drop vs. crack extension calibration curves for fracture mechanics test specimens is investigated. The influence of finite element mesh size and the use of singular elements at the crack tip are considered. Also, some of the details of the compact specimen geometry and electrical potential set-up are examined. Electrical potential solutions for very deep cracks in the compact specimen were obtained and extrapolated to a limiting case solution. A comparison of some of the solutions generated in this investigation with other available numerical solutions and experimentally measured data was very favorable. (10 refs.)

71501 *J*-integral evaluation by resistance strain gauges. W.A.Kawahara, S.L.Brandon (Sandia Nat. Labs., Livermore, CA, USA).
Eng. Fract. Mech. (GB), vol.18, no.2, p.427-34 (1983).
Under plane stress, the contour integral J is evaluated using strain gauge measurements on a cracked test specimen. Results compare favorably with the conventional compliance technique for experimental J evaluation except at relatively small loads. The technique holds the potential for real-time, single-specimen J evaluation. (17 refs.)

71502 Modified Manjoine WOL specimen for J_{Ic} and δ_i tests. D.M.O'Brien, W.G.Ferguson (Dept. Chem. & Materials Engng., Univ. of Auckland, Auckland, New Zealand).
Eng. Fract. Mech. (GB), vol.18, no.2, p.453-65 (1983).
A procedure is presented by which a modified WOL specimen can be designed to withstand the load required to achieve a δ_i or J_{Ic} test for a low yield strength, high toughness material, using information from the test of a standard WOL specimen that has suffered plastic collapse of its loading arms. The K-calibration for the family of geometries used is obtained from published data fitted to a 2-dimensional half-power series, and the load point and gauge point compliances are obtained through a connected beam model that is calibrated from existing compliance data to imitate a WOL specimen. From these calibrations the J-integral tensile component correction factor is evaluated and found to be applicable for this type of specimen. (17 refs.)

71503 Dynamic characters of anisotropic materials for stress distributions. M.Shibahara, Y.Matsui, H.Aiba (Kanazawa Univ., Kanazawa, Japan).
Mem. Fac. Technol. Kanazawa Univ. (Japan), vol.15, no.2, p.65-72 (Nov. 1982). In Japanese.
The dynamic stress distribution around a circular hole was investigated by using the dynamic photoelastic method repeatedly and the image converter camera IMACON-790. The specimens containing the circular hole were made from the epoxy resin isotropic plate or the glass-fiber/epoxy laminate orthotropic plate in which the glass-fiber was arranged either parallel to or at right angles to the impact direction. These specimens were loaded dynamically by the falling impact indentor, and the orthotropic characters depending on the glass-fiber were clarified. The results show that the stress concentration is reduced and that the orthotropic specimen behaves similarly to the isotropic specimen, when the glass-fiber is arranged at right angle to the impact direction. On the other hand, however, in the case when the glass-fiber was arranged parallel to the impact direction, the orthotropic specimen showed very different behaviour in comparison with the isotropic specimen, i.e. the Young's modulus and the stress concentration around the circular hole increased. (4 refs.)

71504 Introduction to modal analysis. I. E.Ossner (Fachhochschule Augsburg, Augsburg, Germany).
Mess. & Pruef. (Germany), vol.19, no.4, p.181-3 (April 1983). In German.
Describes modal analysis as the determination of the modes of natural vibration of structures with their natural frequencies and the corresponding amplitudes, with special reference to the transfer function of a system with one degree of freedom, and to the frequency characteristic function. (3 refs.) *J.S.*

71505 Equipment for testing shell stability at high temperature. P.G.Zykin, V.V.Vasil'ev (Ufa Aviation Inst., Ufa, USSR).
Strength Mater. (USA), vol.14, no.5, p.709-12 (May 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.5, p.120-3 (May 1982). [received: May 1983]
A structure has been proposed for modeling gas pressure on a test shell of complex shape by discrete forces using pairs of hydraulic rams. The nature of wave formation during stability loss in shell loaded by means of discrete forces corresponds to wave formation with gas pressure loading. Results have been obtained for experimental study of shell stability in order to develop design programs in a computer. (4 refs.)

71506 Method of normal stress differences in photoelasticity. Yu.I.Vologzhaninov, S.G.Demidenko, A.V.Churpita (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.8, p.763-6 (Aug. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.8, p.102-5 (Aug. 1983).
The optical path difference σ and isocline parameter ϕ are measured in the polarization-optics method of investigating stresses. These quantities govern the tangential stress τ and the difference between the normal stresses $r=\sigma_x-\sigma_y$. To separate σ_x and σ_y, the method of the difference between the tangential stresses is used as a rule, which is based on the numerical integration of the equilibrium equations by using the quantity τ. Inevitable errors in measuring ϕ near the axes of symmetry influence the accuracy in determining τ substantially. Equations are derived that relate σ_x and σ_y to r. The solutions of their corresponding difference equations are obtained and the procedure for separating σ_x and σ_y by the method of the difference in the normal stresses is elucidated. (7 refs.)

46.60 RHEOLOGY OF FLUIDS AND PASTES

71507 Slow motion of a sphere through an anisotropic, viscoelastic fluid. V.S.Volkov.
Appl. Math. & Mech. (USA), vol.46, no.2, p.185-9 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.248-53 (1982).
Slow motion of a rigid sphere through an incompressible, linear anisotropic viscoelastic fluid of general type is studied. Expressions for the force and moment acting from the fluid towards the sphere are obtained. The results obtained can be used in constructing a theory of viscoelasticity of concentrated polymer solutions and melts where the mobility of the polymer chains is strongly anisotropic. (9 refs.)

71508 Viscoelastic shear thinning of liquids. A molecular-dynamics study. D.M.Heyes (Dept. of Chem., Royal Holloway Coll., Univ. of London, Egham, England), C.J.Montrose, T.A.Litovitz.
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.4, p.611-35 (April 1983).
A molecular-dynamics investigation into the microscopic response of simple liquids subjected to severe shearing conditions is discussed. The quantitative behaviour of a model Lennard-Jones liquid and experimental data on more complicated molecular fluids at high levels of stress are strikingly similar, provided appropriate adjustments of characteristic relaxation time-scales are made. The simulations give insights into the structural origin of material failure at high shear stresses and reveal, at high pressures, a restructuring of the medium into layers, which permits easier flow and hence reduces its viscosity. This change is also manifest in an increase of internal pressure (at constant volume) and a decrease in low-frequency shear rigidity modulus and thermal conductivity. Associated temperature distributions in the nonlinear region of viscosity are consistent with macroscopic continuum theory, suggesting that the thermal effects due to shear are essentially decoupled from any parallel structural changes. (47 refs.)

71509 Transient structures and rheological properties of SBS block copolymer melts. N.Sivashinsky, Tak Jin Moon, D.S.Soong (Dept. of Chem. Engng., Univ. of California, Berkeley, CA, USA).
J. Macromol. Sci. - Phys. (USA), vol.B22, no.2, p.213-29 (1983).
Shear stress growth and relaxation behavior of two well-characterized SBS block copolymers have been studied using a melt elasticity tester. Effects of casting solvents on the transient rheological properties and structure variation during flow are determined via samples cast from THF/MEK and cyclohexane. The temperature dependence of the observed shear stress at the yield point and steady-state viscosities provides insight into the mechanism of structure breakdown induced by the applied flow. Shear stress relaxation upon cessation of flow reveals complex behavior, depending on temperature, casting solvents, and duration of previous flow. Strain recovery data have also been obtained, indicating strong dependence on the composition of the copolymers. The significance of these observations in terms of the melt structure of SBS is discussed. (28 refs.)

71510 Nonlinear truncation error analysis of finite difference schemes for the Euler equations. G.H.Klopfer (Nielson Engng. & Res. Inc., Mountain View, CA, USA), D.S.McRae.
AIAA J. (USA), vol.21, no.4, p.487-94 (April 1983).
Finite difference solutions to nonlinear equations governing fluid flow often exhibit large errors in the vicinity of discontinuities or steep gradients. The author details a technique for analyzing these errors through use of modified equation approach. Once the leading error terms are identified, a procedure is demonstrated whereby these terms can be removed as the solution proceeds. The resulting corrected solution is shown to be much improved at discontinuities. In order to illustrate this technique, the modified equation is developed to fourth order for both general classes of two-step Lax-Wendroff schemes (1960) and the implicit schemes due to Beam and Warming (1978). Both the applied to the one-dimensional Euler equations. Solutions of the one-dimensional shock tube problem are obtained, both with and without removal of the leading error terms. (13 refs.)

71511 Conservation form, in general non steady coordinates, of the Navier-Stokes equations and boundary conditions for a moving boundary problem. M.Strain (Istituto di Macchine e Tecnologie Meccaniche, Facolta di Ingegneria, Roma, Italy).
Meccanica (Italy), vol.18, no.1, p.8-15 (March 1983).
The conservative form of the complete set of Navier-Stokes equations and boundary conditions for the flow field of two immiscible fluids separated by a moving interface of unknown shape, is obtained with reference to a boundary fitted system of non steady general coordinates. The method applied to obtain the set of equations as the limit, in the case of small relative velocities, of the corresponding set in the frame of relativistic fluid mechanics, seems particularly direct and appropriate to express the boundary conditions on the moving interface. The immediate extension of the method to treat different kinds of interfaces of discontinuity is also discussed. (10 refs.)

71512 Effects of interfacial transport on the equilibrium fluctuations in fluid layers. D.Gutkowicz-Krusin (Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA), I.Procaccia.
Phys. Rev. A (USA), vol.27, no.5, p.2585-602 (May 1983).
Complete hydrodynamic theory of the dynamics of equilibrium fluctuations in one-component fluid layers confined by rigid solid boundaries is presented. The dynamic structure factor for such a fluid layer is shown to have both diagonal and off-diagonal elements which depend on the layer height L and on the transport of energy and tangential momentum across the fluid-solid interfaces. The effects of interfacial energy transport have been analyzed in the limits of maximum or vanishing tangential momentum transport ('stick' or 'slip' boundary conditions on the velocity field). In the presence of interfacial transport, two new propagating modes have been found for each distinct interface. In the limit of maximum energy and/or tangential momentum transport, the new modes differ from the bulk sound modes only by an increased attenuation coefficient. Additional dissipation is in part due to shear created by the boundaries and, in part, since the sound is not isothermal, to heat conduction between the fluid and solid. In the dynamic structure factor, the new modes appear as additional peaks in the vicinity of the Brillouin peaks of the unbounded fluid; for wave vectors typical of light scattering experiments these peaks are found to be significant for $L\sim100$ μm. Since the positions and line shapes of these peaks are very sensitive to interfacial transport, their study may provide a useful experimental probe of transport across the fluid-solid interfaces. 47.15 LAMINAR FLOWS

71513 Charge generation in low dielectric constant liquids. H.L.Walmsley (Thornton Res. Centre, Shell Res. Ltd., Chester, England).
Electrostatics 1983. Sixth Conference on Electrostatic Phenomena, Oxford, England, 13-15 April 1983 (Bristol, England: IOP 1983), p.45-52
A theoretical model for the charge generated by the laminar flow of low dielectric constant liquids through infinitely long pipes has been extended to cover turbulent flow in infinitely long pipes and then, with some additional restrictions, turbulent flow in pipes of finite length. In the present paper the author summarises the results of the above modelling and highlights the influence of various physical processes on charge generation by comparing the currents obtained with laminar and turbulent flows, long and short pipes, and with equilibrium and non-equilibrium boundary conditions. 47.15C Laminar boundary layers

71514 Investigation of the influence of the unit Reynolds number of the transition of a boundary layer on a sharp cone. V.Ya.Borovoi, Yu.Yu.Kolochinskii, L.V.Yakovleva.
Fluid Dyn. (USA), vol.17, no.4, p.513-19 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.32-8 (July-Aug. 1982). [received: April 1983]
To establish the influence of the unit Reynolds number on the transition of a boundary layer on the side surface of a cone, the transition was investigated on a model of a sharp cone with half-angle $\theta=7.5°$ and lengths from 150 to 400 mm. The experiments were made in a shock tube at Mach number $M_\infty=6.1$ in the wide range of Reynolds numbers $Re_{eL}=1.3\times10^6$-5.5×10^7. The position of the transition region was determined from the results of measurement of the local heat flux by calorimetric thermocouple converters. Data were obtained on the influence on the transition of the unit Reynolds number at large values. It was also shown that under the investigated conditions the base region does not influence the transition of the boundary layer on the surface of the cone. (9 refs.)

47.20 HYDRODYNAMIC STABILITY

71516 On stability of non-parallel flows and the continuous spectrum. M.Bouthier (Lab. de Mecanique Theorique, Paris, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.8, p.593-6 (28 Feb. 1983). In French.
Concerning non-parallel flows, the continuous spectrum is proved to be two-dimensional and a formula for the related wave packet is given. (4 refs.)

71517 Shear-flow instability at the interface between two viscous fluids. A.P.Hooper, W.G.C.Boyd (School of Math., Univ. of Bristol, Bristol, England).
J. Fluid Mech. (GB), vol.128, p.507-28 (March 1983).
Considers the linear stability of the cocurrent flow of two fluids of different viscosity in an infinite region (the viscous analogue of the classical Kelvin-Helmholtz problem). Attention is confined to the simplest case, Couette flow, and the authors solve the problem using both numerical and asymptotic techniques. They find that the flow is always unstable (in the absence of surface tension). The instability arises at the interface between the two fluids and occurs for short wavelengths, when viscosity rather than inertia is the dominant physical effect. (16 refs.)

47.25 TURBULENT FLOWS, CONVECTION, AND HEAT TRANSFER

71519 Turbulent velocity fluctuations that control mass transfer to a solid boundary. J.A.Campbell, T.J.Hanratty (Univ. of Illinois, Urbana, IL, USA).
AIChE J. (USA), vol.29, no.2, p.215-21 (March 1983).
The relation between the velocity and concentration fields for a fully developed turbulent flow which transfers mass to a pipe wall at large Schmidt numbers has been studied. Measurements of the fluctuations of the concentration gradient and the velocity gradient were obtained simultaneously at multiple locations on the wall. Spatial scales were calculated for the low frequency velocity fluctuations by passing the measured signals through low-pass filters. These scales are the same size as the scales of the concentration fluctuations. This result provides additional support for the notion that mass transfer to a boundary at high Schmidt numbers is controlled by low frequency velocity fluctuations which contain only a small fraction of the total turbulent energy. (14 refs.)

71520 Mechanism of turbulent mass transfer at a solid boundary. J.A.Campbell, T.J.Hanratty (Univ. of Illinois, Urbana, IL, USA).
AIChE J. (USA), vol.29, no.2, p.221-9 (March 1983).
Mass transfer between a turbulent fluid and a solid boundary is considered for the case of large Schmidt numbers. The variation of the mass transfer coefficient with time, $K(t)$, is calculated by solving the mass balance equation using a random velocity input. An interpretation of the mass transfer process which is radically different from that given by classical approaches is obtained. (20 refs.)

71521 On circulation-preserving complex-lamellar motions with steady streamlines. A.W.Marris, Wan-Lee Yin (School of Engng. Sci. & Mech., Georgia Inst. of Technol., Atlanta, GA, USA).
Arch. Ration. Mech. & Anal. (Germany), vol.82, no.2, p.109-15 (1983).
Although the circulation-preserving property is defined in terms of a material description of fluid flow, an equivalent condition, referring to the existence of the acceleration potential, presents a differential equation for the flow velocity in the Eulerian description: $\partial/\partial t$ curl $\nu-$curl $(\nu\times$curl $\nu)=0$. This equation can be useful, when affiliated with other defining assumptions of purely geometrical types, for investigating the nature of the field of flow in specific classes of circulation-preserving motions. The authors introduce additional assumptions requiring the streamlines (but generally not the velocity magnitude) to be steady and to form a congruence of curves normal to a family of surface (complex-lamellar flows with steady streamlines). These assumptions by themselves can be used to extract from the preceding equation a simple relation, valid at each instant and along each vortex line, between the flow speed and the local spacing of the normal surfaces of the velocity vector. (2 refs.)

71522 Negative viscosity effect in large-scale turbulence. Long-wave instability of a periodic system of eddies. G.I.Sivashinsky (School of Math. Sci., Tel-Aviv Univ., Tel-Aviv, Israel).
Phys. Lett. A (Netherlands), vol.95A, no.3-4, p.152-4 (25 April 1983).
The effect of negative viscosity in large-scale turbulence may be understood as a long-wave instability of a system of small-scale eddies supported by external energy sources. (18 refs.)

71523 Product integration methods for the nonlinear Basset equation. S.McKee (Computing Lab., Univ. of Oxford, Oxford, England), A.Stokes.
SIAM J. Numer. Anal. (USA), vol.20, no.1, p.143-60 (Feb. 1983).
Product integration methods are derived through backward difference interpolation for the solution of a nonlinear generalisation of the Basset equation; this equation models the motion of a particle in a turbulent fluid at reasonably high Reynolds numbers. It is proven that the production integration algorithm using $n+1$ points with backward difference interpolation is convergent of order n if $n\leq6$. Simple numerical results are given. Numerical stability is discussed and a diagram of stability is exhibited. (12 refs.)

47.25C Isotropic turbulence

71524 An interaction algorithm for three-dimensional turbulent subsonic aerodynamic juncture region flow. A.J.Baker (Univ. of Tennessee, Knoxville, TN, USA), J.A.Orzechowski.
AIAA J. (USA), vol.21, no.4, p.524-33 (April 1983).
An order-of-magnitude analysis of the subsonic three-dimensional, steady time-averaged Navier-Stokes equations for semibounded aerodynamic junction geometries yields the parabolic Navier-Stokes simplification. The numerical solution of the resultant pressure Poisson equation is cast into complementary and particular parts, yielding an iterative interaction algorithm with an exterior three-dimensional potential flow solution. A parabolic transverse momentum equation set is constructed, wherein robust enforcement of first-order continuity effects is accomplished using a penalty differential constraint concept within a finite-element solution algorithm. A Reynolds stress constitutive equation, with low-turbulence Reynolds number wall functions, is employed for closure, using parabolic forms of the two-equation turbulent kinetic energy-dissipation equation system. The algorithm is employed to predict the three-dimensional turbulent flowfield in the juncture region formed by two intersecting parabolic arcs at $M_{\propto}=0.88$ and $Re/C=0.6\times10^6$/m. Additional results document the turbulence closure model. (31 refs.)

71525 Calculation of turbulent flow of an incompressible fluid in a circular tube with suction through porous walls. V.M.Eroshenko, A.V.Ershov, L.I.Zaichik.
Fluid Dyn. (USA), vol.17, no.4, p.559-64 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.87-93 (July-Aug. 1982). [received: April 1983]
The authors use a three-parameter model of turbulence to calculate turbulent flow in a tube with uniform suction of incompressible fluid through permeable walls. The three-parameter model is based on the balance equations for the turbulence energy, the Reynolds tangential stresses and the dissipative function. (21 refs.)

71526 Calculation of fully developed turbulent flows in ducts of arbitrary cross-section. A.Nakayama, W.L.Chow (Dept. of Mech. & Industrial Engng., Univ. of Illinois, Urbana, IL, USA), D.Sharma.
J. Fluid Mech. (GB), vol.128, p.199-217 (March 1983).
The algebraic stress model developed by Launder and Ying (1973) for the secondary flow of the second kind was employed with the k and ϵ model for the prediction of fully developed turbulent flows in square, rectangular and trapezoidal ducts using the numerical procedure designed for ducts of arbitrary cross-sectional shape. Results of the calculation are compared extensively with available experimental data, with strong emphasis on the local structures of turbulence to reveal full features of this particular stress model. (22 refs.)

71527 The effect of a passive cross-stream temperature gradient on the evolution of temperature variance and heat flux in grid turbulence. A.Sirivat, Z.Warhaft (Sibley School of Mech. & Aerospace Engng., Cornell Univ., Ithaca, NY, USA).
J. Fluid Mech. (GB), vol.128, p.323-46 (March 1983).
The evolution of temperature variance and heat flux in decaying grid turbulence with a linear cross-stream temperature gradient is studied by producing the temperature gradient by means of two different methods: (*a*) by placing a 'mandoline' (Warhaft and Lumley 1978) downstream from the grid but with its wires differentially heated for the present study, and (*b*) by differentially heating ribbons of nichrome (a 'toaster') placed in the plenum chamber of the wind tunnel. For the former method the initial

thermal/mechanical lengthscale ratio L_θ/L was varied by changing the mandoline configuration. For this method it is shown that the gradient causes L_θ/L to equilibrate to a value of about 0.9 regardless of its initial value, and that when this value is achieved the temperature variance increases approximately linearly with time. The toaster was used to produce a temperature gradient without the associated initial temperature variance (and initial thermal lengthscale) that is necessarily produced by the mandoline wires; for the toaster the temperature variance was produced solely by the action of turbulence against the temperature gradient. (15 refs.)

71528 Effect of polymer additives on propagation of turbulence front. V.N.Kalashnikov, V.A.Kalinichenko (Inst. of Problems in Mech., Acad. of Sci., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.2, p.862-6 (Aug. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.2, p.220-4 (Aug. 1982). [received: April 1983]
A study is made of the propagation of a turbulent region formed by vibrations of plates with holes in solutions of polyoxyethylene and guar resin. Polymer additives are found to appreciably affect the motion of a turbulence front. (19 refs.)

71529 A group of second-order turbulence models for flow with curved current lines. E.P.Sukhovich.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.1, p.84-91 (1983). In Russian.
Five turbulence models with different complexity, based on the transport equations for Reynolds stress tensor and for velocity and temperature pulsation correlations, were developed. The models were derived for the complete second-order turbulence model using some simplifying assumptions. All models contain a common system of empirical coefficients. The group of models presented here is meant for the analysis of complicated turbulent flows. The analysis of applicability of these models to flow with curved current line was performed. Comments are given as to the choice of turbulence models which can be used for description of effects occurring due to strong influence of inertia force field on the turbulence structure. (13 refs.)

47.25F Boundary layer and shear turbulence

71530 Riblets as a visuous drag reduction technique. M.J.Walsh (NASA, Langley Res. Center, Hampton, VA, USA).
AIAA J. (USA), vol.21, no.4, p.485-6 (April 1983).
The viscous drag of turbulent boundary layers is a significant factor contributing to the fuel costs of the airlines. Several studies have indicated that microsurface geometry variations which change the near-wall structure of the flow have been effective in reducing drag. An investigation into the verification and extension of the most promising of these riblet variations is reported. (4 refs.)

71531 Freestream turbulence effects on attached subsonic turbulent boundary layers. S.Raghunathan, R.J.W.McAdam (Queen's Univ. of Belfast, Belfast, N Ireland).
AIAA J. (USA), vol.21, no.4, p.503-8 (April 1983).
Experimental data on the influence of freestream turbulence in the range 0.3-6% on an attached turbulent boundary layer at zero pressure gradient, at a Mach number of 0.8 and at a momentum thickness Reynolds number of 10^4 are presented. Correlations with the low speed data indicate that there is no influence of Reynolds number on the freestream turbulence/boundary-layer interaction. The skin friction coefficient shows nonlinear effects at low turbulence levels and correlates well with the wall turbulence. The boundary-layer momentum thickness shows an initial increase followed by a decrease in its levels with the increase in turbulence. (12 refs.)

71532 A method of predicting unsteady turbulent flows and its application to diffusers with unsteady inlet conditions. A.A.Lyrio, J.H.Ferziger (Stanford Univ., Stanford, CA, USA).
AIAA J. (USA), vol.21, no.4, p.534-40 (April 1983).
An integral method for computing the main characteristics of unsteady, incompressible, turbulent flows is developed. The method is applied to unsteady boundary layers with a prescribed freestream velocity and to diffusers with unsteady inlet conditions. For prescribed pressure gradient flows, the method gives as good results and is more than an order of magnitude faster than finite difference methods. For diffuser flows, no other methods have been found in the literature. (30 refs.)

71533 Compressible turbulent boundary layer in strong adverse pressure gradient. Dong-ho Lee (Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).
AIAA J. (USA), vol.21, no.4, p.632-3 (April 1983).
An experiment of shock wave/turbulent boundary-layer interaction in a supersonic wind tunnel was reported by Ardonceau et al. (1979). This Note summarizes an extensive analysis of the mean data carried out to study the effects of pressure gradient and upstream history on the development of compressible turbulent boundary layer. (11 refs.)

71534 Influence of finite slot size on boundary layer with suction or injection. J.Brandeis (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
AIAA J. (USA), vol.21, no.4, p.636-7 (April 1983).
Suction and injection are two widely used methods for boundary-layer control. In practice, the mass transfer at the wall is accomplished through a number of finite-size holes or slots. The author examines numerically the flowfield within a finite, two-dimensional slot through which fluid can either be added or subtracted from the boundary layer. The results obtained provide a more realistic and accurate description of the velocity distribution at the outlet of a slot. The effects of the size of the slot on the flowfield are noted. (8 refs.)

71535 Nonsimilar boundary layers on the leeside of cones at incidence. T.Cebeci, K.Stewartson, S.N.Brown (Res. Aerodynamics Subdiv., Douglas Aircraft Co., Long Beach, CA, USA).
Comput. & Fluids (GB), vol.11, no.3, p.175-86 (1983).
It is known that the similarity equations for the leeward line of symmetry of a cone have no solutions for $-1<k_2^*<k<k_1^*<0$, where k is the incidence parameter of Moore, and k_1^*, k_2^* depend on the external Mach number and enthalpy ratio. The authors present evidence that a leeside integration for such k terminates at a finite distance from the vertex in a singularity of the type analyzed by Stewartson and Simpson (1982) for entry flow in a curved pipe, and compare the theory with a representative numerical solution at $k=-1/2$. A possible interpretation of this singularity is that the boundary layers growing from the windward line of symmetry have collided, and support for this view is given by windward to leeward integrations for a range of values of k. For k such that the similarity equations have solutions, these are interpreted as limits of more general solutions. (17 refs.)

71536 Slow flow of gas past a strongly heated sphere in the presence of blowing and evaporation from its surface. A.Yu.Boris.
Fluid Dyn. (USA), vol.17, no.4, p.593-8 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.128-34 (July-Aug. 1982). [received: April 1983]
A solution is obtained to the problem of the simultaneous influence of blowing (evaporation) and large temperature differences on the flow past a sphere and on the force acting on it with allowance for the Burnett thermal stresses in the momentum equation. It is assumed that the Reynolds numbers calculated using the blowing velocity and the velocity of the oncoming flow, respectively, have the order $\mathrm{Re}_w \sim 1$ and $\mathrm{Re}_\infty \ll 1$. The temperature difference is determined by the boundary conditions, namely, a constant temperature $\mathrm{T}_w \neq \mathrm{T}_\infty$ on the surface of the sphere ($\nabla \mathrm{T}/\mathrm{T} \sim 1$). The problem is solved by the method of matched asymptotic expansions with respect to the small parameter Re_∞. The equations reduce to a system of ordinary differential equations, which are solved numerically by the orthogonal sweep method. It is found that under certain conditions the drag of the sphere can become negative. (10 refs.)

71537 Flow-acoustic interaction near a flexible wall. A.P.Dowling (Dept. of Engng., Univ. of Cambridge, Cambridge, England).
J. Fluid Mech. (GB), vol.128, p.181-98 (March 1983).
The Lighthill theory has been extended so that it may be used to determine the flow noise induced by a turbulent boundary layer over a plane homogeneous flexible surface. The influence of the surface properties and the mean flow on the sound generated is brought out explicitly through the use of a Green function. It is found that there is an analogy between the sound generated by turbulence and equivalent sources placed between a surface with the same compliance as the physical surface and a hypothetical vortex sheet positioned at the outer edge of the boundary layer. This analogy is used to determine the spectrum of the surface-pressure fluctuations under statistically stationary turbulence. The form of this wall-pressure spectrum is investigated in detail for three particular types of surface: rigid surfaces, bending plates and sound-absorbent liners. (15 refs.)

71538 On the role of wall-pressure fluctuations in deterministic motions in the turbulent boundary layer. A.S.W.Thomas, M.K.Bull (Dept. of Mech. Engng., Univ. of Adelaide, Adelaide, Australia).
J. Fluid Mech. (GB), vol.128, p.283-322 (March 1983).
The wall-pressure fluctuations beneath a turbulent boundary layer have been conditionally sampled on a basis of the high-frequency activity of the pressure fluctuations themselves, the high-frequency activity of the streamwise velocity fluctuations in the vicinity of the wall, and the excursions in velocity in the vicinity of the wall. This has led to the identification of a characteristic wall-pressure fluctuation pattern which is associated with the burst-sweep cycle of events in the wall region. The pattern has the form of an overpressure over a streamwise extent of about 1.5-2.0 δ_*, with a region of underpressure and a pressure minimum to either side of it, the distance between pressure minima being about 3.0-3.5 δ_*. This pattern is convected at a velocity 0.67 times the freestream velocity. Its phase relationship with velocity fluctuations close to the wall and the wall shear-stress fluctuations during the burst-sweep cycle have been established. It appears to be produced by the inclined shear layer which forms the upstream surface of the large organized structures in the layer, and calculated pressure patterns support this conclusion. (40 refs.)

71539 Some aspects of fluctuating vertical wind shears. J.C.Doran (Pacific Northwest Lab., Richland, WA, USA).
Sol. Energy (USA), vol.30, no.5, p.473-9 (1983).
Fluctuating vertical shears of wind speed have been measured using anemometers on an array of towers. The statistical distributions of these shears are compared with formulas proposed by Fichtl and good agreement is found. A comparison of Fichtl's formula for $\sigma_{\Delta u}$, the standard deviation of the fluctuating shears, with a more empirical one proposed by Ramsdell shows that the latter is consistent with the former under the proper conditions. The probability of occurrence of extreme shears in speed is discussed. Fluctuating shears two or more times larger than the mean values are shown to occur frequently, and their likelihood increases as the mean measuring height increases if Δz is held fixed. These results are applicable for slightly unstable to neutral conditions over level, homogeneous terrain, and in the surface boundary layers. The normal distribution gives a useful lower bound on shear values. Probabilities of extreme shears as a function of $\Delta z/\bar{z}$ are given. $\sigma_{\Delta u}$ is also shown to be affected by τ, the averaging time used for the shear measurements. Increasing τ from 0.2 to 4 sec can decrease σ_Δ by 25 per cent or more. The effects of τ on the probability of extreme events is shown. (6 refs.)

47.25M Noise (turbulence generated)

71540 The low wavenumber wall pressure spectrum on a flexible surface. A.P.Dowling (Engng. Dept., Cambridge Univ., Cambridge, England).
J. Sound & Vib. (GB), vol.88, no.1, p.11-25 (8 May 1983).
The Lighthill theory (1952) has been extended so that it may be used to determine the flow noise induced by a turbulent boundary layer over a flexible surface. The theory brings out explicitly the effects of the surface properties. The surface pressure spectrum has been investigated in detail for a bending plate, and the effects of surface dissipation and a coating layer have been determined. It is found that damping in the plate or some coating layers can have a beneficial effect and reduce certain spectral components of the flow noise. However, coatings with a low sound speed are found to have an adverse effect on the flow noise. (12 refs.)

(see also 44.25 Convective and constrained heat transfer)

71541 Prediction of rough-wall skin friction and heat transfer. G.H.Christoph, (Sci. Applications Inc., Wayne, PA, USA), R.H.Pletcher.
AIAA J. (USA), vol.21, no.4, p.509-15 (April 1983).
A finite difference solution to the boundary-layer equations for flow over rough surfaces is presented. The boundary-layer equations are cast in a form to account for the blockage effects of roughness elements. The roughness effect is described by a sink term in the momentum equation and a source term in the static enthalpy equation. A two-layer algebraic mixing length model that accounts for low Reynolds numbers, surface roughness, and wall transpiration is developed. Good agreement is shown for several comparisons to roughwall, flat-plate and sharp-cone data. (25 refs.)

71542 Theoretical study on the development of the axially symmetric thermal plume: influence of thermophysical properties of the fluid. B.Guillou, D.-K.Son (Lab. de Thermique, ENSMA, CNRS, Poitiers, France).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.2, p.101-9 (March-April 1983). In French.
The influence of the variations of the physical properties with temperature on the structure of thermal plumes in air is numerically determined. It is for that purpose that the evolution of the initial theoretical profiles is studied in the case of constant properties (giving self-preserving solutions) and in the case of variable properties. The development of the flow in these two cases is found to be significantly different. Moreover, the comparison with numerical calculations and the authors' laboratory's experiment is satisfactory. (8 refs.)

71543 Mass transfer and free convection through a porous medium by the presence of a rotating fluid. A.Raptis (Dept. of Mech., Univ. of Ioannina, Ioannina, Greece).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.2, p.141-6 (March-April 1983).
Steady free convection and mass transfer through a porous medium bounded by an infinite vertical porous plate is considered for a fluid rotating with a constant angular velocity when the heat flux at the plate is constant. The influence of the various parameters entering into the problem on the velocity field is discussed. (5 refs.)

71544 Effects of variable fluid properties and boundary conditions on thermal convection. A.Cordoba (Dept. de Termologia, Univ. de Sevilla, Sevilla, Spain).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.2, p.147-51 (March-April 1983).
The onset of convection in a fluid layer heated from below is considered. The fluid properties are allowed to vary with temperature according to a linear relation. The fluid layer is bounded by two horizontal rigid plates, and the lower boundary is considered a perfect thermal conductor whereas the upper one is taken with a finite thermal conductivity. With these asymmetric boundary conditions linear variations in density, thermal conductivity and specific heat yield first-order corrections to the critical value of the Rayleigh number whereas linear variations in viscosity and thermal expansion coefficient give rise to second-order corrections to the critical Rayleigh number. The greatest effect is due to thermal conductivity variation. When the boundary conditions are symmetric the corrections are second-order. (11 refs.)

71545 Unsteady Couette flow and heat transfer in a dusty gas. N.Datta, S.K.Mishra (Dept. of Maths., Indian Inst. of Technol., Kharagpur, India).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.2, p.153-62 (March-April 1983).
Unsteady flow of a dusty fluid, filling the gap between two infinite parallel plates kept at arbitrary temperatures, has been considered. The flow is induced by the impulsive start of one of the plates. The number density of the particles has been considered to be uniform throughout the motion and the solution for any time has been obtained by using Laplace transform followed by its numerical inversion. It has been observed that initially there is oscillation in both the fluid velocity and temperature distribution. Also the particles slip on the moving plate at the initial stage. Further Nusselt number increases with the increase of the concentration parameter. (3 refs.)

71546 Calculation of unsteady natural concentration convection in binary mixtures of gases with arbitrary ratio of their densities. D.A.Nikulin, M.Kh.Strelets.
Fluid Dyn. (USA), vol.17, no.4, p.509-13 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.27-31 (July-Aug. 1982). [received: April 1983]
The approximate system of equations formulated by Nikulin, Potekhin, and Strelets (1980) can, in contrast to the system in the Boussinesq approximation, be used to describe natural concentration convection in the presence of significant changes in the composition in gas mixtures with arbitrary ratio of the molecular weights of the components. The possibilities opened up by the use of this system of equations are illustrated by the example of a numerical investigation of unsteady free convection of an isothermal binary gas mixture in a closed rectangular region in a wide range of variation of the Archimedes number and the ratio of the molecular weights of the components of the mixture. (8 refs.)

71547 Vibrational thermal convection in a rectangular cavity. G.Z.Gershuni, E.M.Zhukhovitskii, Yu.S.Yurkov.
Fluid Dyn. (USA), vol.17, no.4, p.565-9 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.94-9 (July-Aug. 1982). [received: April 1983]
Vibrational thermal convection in a rectangular cavity under conditions of weightlessness is studied. A numerical investigation is made of the developed vibrational convection which arises under conditions when equilibrium is impossible. The structure of the average vibrational-convective flows and the characteristics of the heat transfer are determined. The change of regimes and the connection with the stability problem are discussed. (6 refs.)

71548 Investigation of flow past blunt bodies with allowance for radiation by the large-particle method. O.M.Belotserkovskii, Yu.M.Davydov, V.P.Skotnikov, V.N.Fomin.
Fluid Dyn. (USA), vol.17, no.4, p.574-9 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.106-12 (July-Aug. 1982). [received: April 1983]
The large-particle method as developed by Belotserkovskii and Davydov (1971) is developed to calculate hypersonic flows with radiation around blunt bodies, including the case when there is distributed blowing from the surface of the bodies into the shock layer, which stimulates ablation of a heat-shielding covering under the influence of strong heating by radiation. The results are given of systematic calculations of flow past blunt bodies of various shapes by a stream of radiating air, and the results are compared with the data of other methods. (17 refs.)

71549 Natural convection produced by unsteady heating of a viscoplastic liquid in a plane vertical layer. S.G.Cherkasov.
Fluid Dyn. (USA), vol.17, no.4, p.610-12 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.148-50 (July-Aug. 1982). [received: April 1983]
A study is made of the unsteady heating of a viscoplastic liquid in the space between two infinite vertical plates when one is thermally insulated and a constant, uniformly distributed heat flux is supplied to the other after a certain initial time. It is assumed that at the initial time the liquid is uniformly heated. (5 refs.)

71550 Heat transfer in micropolar boundary layer flow over a flat plate. R.S.R.Gorla, R.Pender, J.Eppich (Dept. of Mech. Engng., Cleveland State Univ., Cleveland, OH, USA).
Int. J. Eng. Sci. (GB), vol.21, no.7, p.791-8 (1983).
Boundary layer solutions are presented to study the steady state heat transfer from a semi-infinite flat plate to a micropolar fluid. The boundary conditions of isothermal wall, constant surface heat flux and insulated wall with viscous dissipation effects have been treated. Numerical results for the temperature distribution and the missing wall values of the thermal functions have been given. The range of Prandtl numbers investigated was from 10 to 1000 while the dimensionless grouping of the material properties was allowed to vary over a wide range. (5 refs.)

71551 The dynamics of double-diffusive gravity currents. T.Maxworthy (Dept. of Mech. Engng., Univ. of Southern California, Los Angeles, CA, USA).
J. Fluid Mech. (GB), vol.128, p.259-82 (March 1983).
Gravity currents or intrusions for which the fluid within the current contains a substance that gives it a diffusivity different from that of its surroundings are very common both in natural and technological applications. The interface between the two fluids can become the site of either a 'fingering' or a 'diffusive' type of instability, and vigorous convection and material exchange occurs (Turner 1975). This transfer of material has several important effects upon the dynamics of the intrusion. Horizontal momentum can be transferred across the interface to create a stress which in many cases dominates the more conventional viscous stresses. Entrainment into the convective plume beneath the intrusion and, in a container of finite depth, the formation of a secondary, bottom-boundary current, creates a flow external to the main intrusion which modifies its behaviour even more. Two cases have been studied: the release of a fixed volume of fluid and the injection of fluid at a constant rate for both types of interface. Several experiments on the motion of an intrusion for which the interface is essentially non-diffusive are presented for comparison. (17 refs.)

71552 Natural convection heat transfer in air about a horizontal circular nonisothermal cylinder. V.N.Pustovalov, Yu.Ya.Matveev (V.I. Lenin Kharkov Polytech. Inst., Kharkov, Ukrainian SSR).
J. Eng. Phys. (USA), vol.43, no.2, p.853-8 (Aug. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.2, p.209-15 (Aug. 1982). [received: April 1983]
Results are presentd of a numerical investigation of laminar free convection heat transfer in air about a horizontal circular cylinder in the moderate Grashoff number range ($10^4 \leq Gr_m \leq 10^9$), for linear and quadratic laws of surface temperature variation. (10 refs.)

71553 Free-convection heat transfer on a vertical surface with a temperature discontinuity. Yu.A.Sokovishin, L.A.Erman (M.I. Kalinin Leningrad Polytech. Inst., Leningrad, USSR).
J. Eng. Phys. (USA), vol.43, no.2, p.858-61 (Aug. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.2, p.216-20 (Aug. 1982). [received: April 1983]
Parametric correlations are obtained for calculating heat transfer on a vertical surface with a temperature discontinuity, over a wide range of variation of Prandtl number and for calculating the relations of temperatures at the wall. (9 refs.)

71554 Heat transfer in the nonisothermal flow of an anomalously viscous fluid in a helical duct. A.I.Mumladze, Yu.G.Nazmeev, O.V.Maminov (S.M. Kirov Chem.-Technol. Inst., Kazan, USSR).
J. Eng. Phys. (USA), vol.43, no.2, p.869-74 (Aug. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.2, p.228-34 (Aug. 1982). [received: April 1983]
The problem of heat transfer in the initial section of a helical duct with a steady flow of an anomalously viscous fluid is solved numerically. The authors solve the heat-transfer problem of a duct formed by an internal continuous helicoid vane fitted tightly to the inside wall of the pipe for steady laminar flow of an anomalously viscous temperature-dependent fluid under the condition of dissipative heat loss and Dirichlet-type boundary conditions. (5 refs.)

71555 Theoretical analysis of heat transfer in zone-melting operation. S.Mori (Dept. of Chem. Engng., Kanazawa, Japan), J.Tsuchida, A.Kikuchi, A.Tanimoto.
Mem. Fac. Technol. Kanazawa Univ. (Japan), vol.15, no.2, p.1-12 (Nov. 1982). In Japanese.
The heat conduction in an infinite slab of finite thickness accompanied by a heat source moving at constant speed, was analyzed theoretically. The heat source is specified as either internal heat generation in the slab or external heating at constant flux. The effect of phase change was assumed to be

negligible and physical properties were also assumed to be constant. Through results calculated, the influence of source velocity on shapes and positions of melting and freezing interfaces was found to be important. Moving the heat source tends to make the freezing front more concave in shape. Based on the shape of the growing interface and the temperature gradient near the interface, the optimum operating conditions for zone melting were discussed. (9 refs.)

71556 Examination of the formation of finite disturbances in the course of the convection of a viscoelastic liquid within a horizontal layer. F.A.Gariffullin, F.C.Tasjukow, E.-O.Reher.
Plaste & Kautsch. (Germany), vol.30, no.3, p.157-60 (March 1983). In German.
The investigation of disturbance propagation has great significance for quantifying convective heat transport. The formation of convective laminar vortices in horizontal layers of viscoelastic liquids is discussed from a theoretical viewpoint, with the development of equations. Experimental work has shown that, e.g., non-Newtonian viscoelastic liquids such as polyethylene oxide aqueous solution exhibit a 'hard' instability, leading to the conclusion that the rheological properties of polymer solutions influence the formation and development of the convective process. (6 refs.) *A.E.W.*

71557 Transient thermal Marangoni convection in a liquid bridge [floating zone techniques, near zero gravity]. H.F.Bauer (Hochschule der Bundeswehr Munchen, Fachbereich Luft- und Raumfahrttech., Neubiberg, Germany).
Z. Flugwiss. & Weltraumforsch. (Germany), vol.7, no.2, p.120-33 (March-April 1983). In German.
By a sudden change of an imposed axial temperature field at the liquid surface of an infinite cylindrical liquid bridge, a transient convection is initiated inside the liquid. This is due to the sudden change in surface tension causing a transient flow from an original velocity distribution to a final one by means of the thermal Marangoni effect. This transient has been determined analytically for linear, quadratic, sinusoidal and exponential axial temperature fields. Some special cases have been evaluated numerically. It should be noted that the method presented may also be used if any periodic axial temperature distribution is suddenly changed into any other periodic temperature field. It is also valid for time-periodic temperature fields. (28 refs.)

71558 The onset of chaos in convecting fluids. P.C.Martin (Phys. Dept. & Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA).
Melting, Localization, and Chaos. Proceedings of the Ninth Midwest Solid State Theory Symposium, Argonne, IL, USA, 2-3 Nov. 1981 (New York, USA: North-Holland 1982), p.179-94
The fluid systems that have been most carefully and extensively studied over the past years, that often exhibit some features of simple mathematical models, and that, in a few cases, show quantitative similarities, are systems in circular Couette flow and systems undergoing Rayleigh-Benard convection. Before discussing a few features of the mathematical models, the author points out some of the complications that occur in real convecting systems, and briefly reviews some recent progress in sorting them out. The degree to which these complications are an essential part of observed turbulent phenomena is still unclear, as is the relevance of the various mathematical models with which the author hopes to model and predict quantitatively the behavior of suitably prepared real fluid systems. Many carefully measured properties of the fluids have yet to be explained by the models, and while it is not difficult to construct simple mechanical systems or analog computers that behave like the mathematical models, in almost every real fluid system some 'messy detail' that the models omit, seems to matter. 71559 The effects of yaw and finite length upon the vortex wakes of stationary and vibrating circular cylinders. S.E.Ramberg (Div. of Marine Technol., Naval Res. Lab., Washington, DC, USA).
J. Fluid Mech. (GB), vol.128, p.81-107 (March 1983).
Considers the vortex wakes behind finite-length yawed cylinders that are stationary or vibrating transversely in a uniform flow. In the Reynolds-number range 160-10^3 a number of three-dimensional and nominally two-dimensional wake flows are observed and attributed to the dominance of end conditions over rather large spans of the cylinder (aspect ratios up to 100). (29 refs.)

71560 Interference between two circular cylinders forming a cross. M.M.Zdravkovich (Univ. of Salford, Salford, England).
J. Fluid Mech. (GB), vol.128, p.231-46 (March 1983).
The interference of flow around two circular cylinders forming a cross can be considered as an element of a gauze screen or an offshore structure. The most important feature of the interference was found to be a significant increase of local drag coefficient due to the symmetric formation of secondary flow patterns. The pressure distribution measured around both cylinders at various spanwise stations was distinctly different for the two cylinders in the region of interference. A strong secondary flow was found behind the upstream cylinder and in front of the downstream cylinder. The secondary flow distorted and displaced the separation streamlines on the upstream and downstream cylinders. This has been verified by oil-film flow visualization. (13 refs.)

A higher order panel method applied to vortex sheet roll-up ... See Entry 71561

47.30 ROTATIONAL FLOW AND VORTICITY

71561 A higher order panel method applied to vortex sheet roll-up. H.W.M.Hoeijmakers, W.Vaatstra (Nat. Aerospace Lab., NLR, Amsterdam, Netherlands).
AIAA J. (USA), vol.21, no.4, p.516-23 (April 1983).
Describes a computational method for two-dimensional vortex sheet motion in incompressible flow. The procedure utilizes a second-order panel method, an adaptive panel scheme, and a concept for treating highly rolled-up portions of the vortex sheet. Results are presented for the roll-up of the wake behind an elliptically loaded wing, a ring (nacelle), a fuselage/part-span flap/wing combination, and a delta wing with leading-edge vortex sheets. The examples demonstrate that the method is capable of describing complicated vortex sheet motion in a reliable and stable manner. (26 refs.)

71562 On the completeness of Trkalian motions of Navier-Stokes fluids. A.W.Marris (School of Engng. Sci. & Mech., Georgia Inst. of Technol., Atlanta, GA, USA).
Arch. Ration. Mech. & Anal. (Germany), vol.82, no.2, p.117-64 (1983).
In an earlier paper (1979) the author showed that no steady rotational screw motions of Navier-Stokes fluids exist. However, there is a class of screw motions of Navier-Stokes fluids, which are unsteady motions with steady stream lines. Consider the class of screw motions in which the abnormality π_{11} is spatially constant. These motions, known as Trkalian motions, have been the subject of a treatise by Bjorgum & Godal (1952). For a Trkalian motion to be a possible motion of a Navier Stokes fluid the abnormality π_{11} must also be temporally constant and that the velocity field is given by $v=e(-\nu\pi_{11}{}^2t)u$, where u is any steady Trkalian field of abnormality π_{11}. The equation defines a motion whose stream lines are steady but whose velocity magnitude decays exponentially with time. Motions with steady stream lines have some of the physical significance of steady motions. It seems natural to ask, are Trkalian motions the only rotational screw motions of Navier-Stokes fluids for which the stream lines are steady? The author shows that the answer is yes. (5 refs.)

71563 Numerical study of incompressible flow about immersed elastic boundaries. R.Mendez (Naval Postgraduate School, Monterey, CA, USA).
SIAM J. Sci. & Stat. Comput. (USA), vol.4, no.1, p.94-104 (March 1983).
The interaction between a two-dimensional, incompressible inviscid fluid and a one-dimensional tense elastic boundary is studied. The boundary exerts forces on the fluid but its motion is determined from the motion of the fluid. The crux of the method lies in the representation of the point-forces into which the boundary stresses are discretised using Peskin's link formalism via a collection of vortex pairs of appropriate opposite strengths (vortex dipoles). Euler's equations are then integrated; the vorticity at the boundary determines the fluid motion everywhere. The method is applied to follow the oscillatory motion of an immersed tense circular boundary which at $t=0$ has been deformed into an ellipse. (8 refs.)

71564 Flow near a vibrating cylinder. E.D.Sorokodum.
Fluid Dyn. (USA), vol.17, no.4, p.654-6 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.190-2 (July-Aug. 1982). [received: April 1983]
The results are given of experimental investigations into the change in the structure of the secondary steady flows near a circular cylinder vibrating in a fluid at rest in the direction perpendicular to its axis in a wide range of vibration amplitudes at high Reynolds numbers. For vibration amplitudes less than the cylinder diameter, not only viscous waves but also four vortices are generated near the surface of the cylinder and four steady flows at some distance from it. During a period of the vibration, the vortices near the cylinder change their shape and position. At vibration amplitudes comparable with the cylinder diameter, the vortices become separated and form two vortex streets. If the vibration amplitude is increased further, the streets bifurcate. (5 refs.)

71565 Analysis of torsional potential streams. V.K.Kostin, V.I.Epifanova.
Izv. VUZ Mashinostr. (USSR), no.3, p.71-5 (1983). In Russian.
Reports the results of a theoretical analysis of the motion of torsional, radially-balanced streams of inviscid barotropic fluid within the potential motion model. The motion of a torsional stream in a vortical device with an isoentropic diffuser is discussed and a dependence derived between stream parameters and the geometric characteristics of the vortical device. A general solution is presented for the motion of a torsional stream in the vortical device with an isoentropic diffuser. The results for the torsional stream are given for the case of diffuser-free vortical device, and for a device with an isoentropic diffuser. The possibility of generation of shock waves in the stream is discussed and the bounds for shock-free motion of the barotropic fluid are established. (6 refs.) *Z.F.V.*

71566 The flow between two finite rotating disks enclosed by a cylinder. D.Dijkstra, G.J.F.van Heijst (Dept. of Appl. Math., Twente Univ. of Technol., Enschede, Netherlands).
J. Fluid Mech. (GB), vol.128, p.123-54 (March 1983).
The flow between two finite rotating disks enclosed by a cylinder is investigated both numerically and experimentally. For this finite geometry the full stationary Navier-Stokes equations are solved numerically without similarity assumptions. Experimental results are obtained by means of stereophotography of small tracer particles. The results are in good agreement with the numerical solution. Owing to the presence of the cylinder sidewall, the solution is found to be unique for all values of the parameters considered. When the disks rotate in opposite senses with counter-rotation above 15%, a stagnation point appears at the slower-rotating disk. This stagnation point is associated with a two-cell structure in the meridional plane and is experimentally observed as a ring of particles at the slower-rotating disk. Near the axis of rotation the solution is found to satisfy similarity demands; for weak counter-rotation the solution is of Batchelor type near the axis of rotation, but for strong counter-rotation a Stewartson profile is found to be more adequate for the description of the tangential velocity near the axis. (16 refs.)

71567 The velocity perturbations above the orifice of an acoustically excited cavity in grazing flow. A.F.Charwat, B.E.Walker (Dept. of Mech. & Structures, Univ. of California, Los Angeles, CA, USA).
J. Fluid Mech. (GB), vol.128, p.413-26 (March 1983).
Detailed measurements of the time-dependent velocities induced inside and outside the opening of an acoustically excited, two-dimensional Helmholtz resonator imbedded in a grazing flow are presented. The remarkably clear structure of the perturbation field which evokes a pulsating source and a coherently pulsating vortex-image pair is described. (11 refs.)

71568 Coaxial-disk flow and flow about a rotating disk of a Maxwellian fluid. N.Phan-Thien (Dept. of Mech. Engng., Univ. of Sydney, Sydney, NSW, Australia).
J. Fluid Mech. (GB), vol.128, p.427-42 (March 1983).
The flows of a Maxwellian fluid between two rotating coaxial disks and about a rotating disk are discussed. Asymptotic solutions are derived and numerical solutions are reported for a Weissenberg number up to 10 and a Reynolds number of up to 50. The solutions show transverse wave propagation. Also, at low Weissenberg number the moment coefficient for a rotating disk wetted on both sides is inversely proportional to the square root of the angular velocity of the disk. At high Weissenberg number it is inversely proportional to the angular velocity of the disk. The transition occurs at a Weissenberg number of unity. (20 refs.)

71569 Experimental study of mass exchange in axisymmetric cavities. V.V.Degtyareva, V.A.Mukhin, V.E.Nakoryakov (Inst. of Thermophys., Acad. of Sci., Novosibirsk, USSR).
J. Eng. Phys. (USA), vol.43, no.2, p.829-33 (Aug. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.2, p.181-6 (Aug. 1982). [received: April 1983]
Results are presented from a study of mass exchange between the walls in axisymmetric cavities of different configuration and a fluid flow within the cavity. Measurements were made by the electrodiffusion method. The test results are generalized using an empirical relation. (7 refs.)

71570 Transient processes in shear flows of a viscoelastic fluid. III. Elastic recovery. Z.F.Shul'man, S.M.Aleinikov, B.M.Khusid (A.V. Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.2, p.874-8 (Aug. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.2, p.234-8 (Aug. 1982). [received: April 1983]
For pt.II see Inzh.-Fiz. Zh., vol.42, no.6, p.992 (1982). The authors investigate the transient process associated with the shear flow of a viscoelastic fluid in the clearance space between coaxial cylinders when the outer cylinder is rigidly fixed and the inner one set in motion of the action of a constant external torque. The applied torque acts for a period of time t*, after which it is removed. A mathematical description of the elastic recovery effect associated with viscoelastic shear flow is given. (2 refs.)

71571 Temporal development of the Taylor vortices in a rotating fluid. V. H.Yahata (Dept. of Materials Sci., Hiroshima Univ., Hiroshima, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.396-402 (Feb. 1983).
For pt.IV see ibid., vol.66, p.879 (1981). Transition to turbulence in the Taylor vortex flow between two concentric cylinders is investigated by the use of the 56-mode model equations presented by the author in pt.IV. With the increase of the Reynolds number just before the onset of turbulence, the motion changes as follows: Quasi-periodic motion with three fundamental frequencies to synchronized motion with two frequencies to non-periodic motion. (8 refs.)

71572 Experiments on wave number selection in rotating Couette-Taylor flow. D.S.Cannell, M.A.Dominguez-Lerma, G.Ahlers (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).
Phys. Rev. Lett. (USA), vol.50, no.18, p.1365-8 (2 May 1983).
Experimental results are reported for the selection of axial wavelengths of Taylor vortices in a system where the Reynolds number, R, is 'ramped' spatially from above to below the critical value, R_c, for the onset of vortex flow. It is found that a sufficiently slow ramp connecting the supercritical region (containing vortices) to a subcritical region (of purely azimuthal flow) results in the selection of a unique wavelength. A more rapid ramp results in a small R-dependent band of allowed wavelengths which grows in width as $R \rightarrow R_c$ from above. (18 refs.)

71573 Vortex-front propagation in rotating Couette-Taylor flow. G.Ahlers, D.S.Cannell (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).
Phys. Rev. Lett. (USA), vol.50, no.20, p.1583-6 (16 May 1983).
This Letter reports experimental measurements of the velocity v of a Taylor vortex front propagating into an unstable Couette state in rotating Couette-Taylor flow and of the wavelength selected by this dynamical process. The data are consistent with a constant velocity $v \propto \epsilon^{1/2}$, as predicted from an amplitude equation, but are nearly a factor of 2 smaller than that prediction. Recent dynamic experiments on the onset of Taylor vortex flow by Park, Crawford, and Donnelly (1981) are explained in terms of vortex-front propagation. (13 refs.)

71574 Couette flow in continuum to the free molecular regime. K.Nanbu (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan).
Rep. Inst. High Speed Mech. Tohoku Univ. Ser. B (Japan), vol.46, p.199-223 (1983).
By use of the direct-simulation method of Nanbu (1980), the Couette flow for wall Mach number 3 is analysed over the whole range of the Knudsen number. The gas is a monotonic one of Maxwell molecules. By comparing the numerical solution obtained from simulation calculations with the approximate six-moment solution of Liu and Lees (1961), the accuracy of the latter is examined in detail. As to the flow velocity and shearing stress, the six-moment solution shows reasonable agreement with the simulation solution. As to the temperature, density, and heat flux, the error of the six-moment solution is not small in all flow regimes except near-continuum one. As to the pressure, it is not uniform in the transition regime differently from the prediction of the six-moment solution. (23 refs.)

47.35 WAVES

71575 Potential function and problems of oscillations of an exponentially stratified liquid. S.A.Gabov, K.S.Mamedov.
Dokl. Akad. Nauk SSSR, vol.269, no.2, p.270-3 (1983). In Russian.
The results reported relate to the representation of the solutions to the system of equations for the dynamics of a stratified liquid, and to the reduction of this system to one differential equation, closely analogous to S.L. Sobolev's equation for a rotating liquid. (7 refs.) *F.Q.*

71576 Normal oscillations of an ideal compressible liquid in rotating elastic vessels. A.Garadzhaev.
Dokl. Akad. Nauk SSSR, vol.269, no.2, p.273-8 (1983). In Russian.
A study is reported of the spectra of oscillations of an ideal compressible liquid in rotating vessels. Cases are found where the vessel, filled with liquid, behaves like a rigid body, an elastic body or an elastic shell. (14 refs.) *F.Q.*

71577 Influence of liquid viscosity and Coriolis force on the stability of internal waves. S.M.Khartiev, L.V.Cherkesov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.3, p.60-3 (1983). In Ukrainian.
Sufficient stability criteria are obtained for internal waves taking into account the Coriolis force, velocity shear of flows, fluid viscosity and stratification. (4 refs.)

71578 Nonlinear capillary waves in thin films of viscous liquid and breaking of the films. O.V.Voinov.
Fluid Dyn. (USA), vol.17, no.4, p.526-33 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.47-55 (July-Aug. 1982). [received: April 1983]
A study is made of the dynamics of a thin film of viscous liquid with allowance for the influence of capillary forces and long-range van der Waals forces. Asymptotic solutions are found to problems of the dynamics of films in communication with a region of reduced pressure. It is shown that at a certain instant such a film breaks at its edge. The critical parameters that determine the instant of breaking are found and the form of the solution in the stage of breaking is given. (8 refs.)

71579 Influence of an underwater ridge on a nonlinear wave expanding from a point on the surface of a liquid. A.G.Kulikovskii.
Fluid Dyn. (USA), vol.17, no.4, p.569-73 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.100-5 (July-Aug. 1982). [received: April 1983]
A study is made of the influence of an underwater ridge on a solitary wave that prior to the interaction with the ridge has the form of a circle situated outside the ridge. It is shown that the nonlinear effects lead to a concentration of the wave energy above the ridge. As they move away from the source, the waves propagating above the ridge are not damped in the considered approximation but are damped everywhere away from the ridge. An analogy is pointed out between the propagation of the wave and two-dimensional steady flows of a fluid, and this makes it possible to use hydrodynamic intuition for qualitative predictions about the nature of the wave propagation in various cases. All the results of the paper can be extended to the case of waves that are periodic in time. (4 refs.)

71580 The entry of a falling film into a pool and the air-entrainment problem. S.D.R.Wilson, A.F.Jones (Dept. of Math., Manchester Univ., Manchester, England).
J. Fluid Mech. (GB), vol.128, p.219-30 (March 1983).
When a film of liquid runs down a vertical wall and enters a large pool a number of stationary horizontal ripples are observed on the film just above the point of entry. These ripples are explained and analysed by the method of matched expansions and the results have a bearing on more-complicated problems. Next the case when the wall itself is moving vertically downwards is analysed. This is of interest in roll-coating technology, where it is normally desired to achieve smooth entry of the descending film, without air entrainment. The paper gives sufficient conditions for smooth entry, and these are consistent with known experimental results. (8 refs.)

71581 Gravity currents with variable inflow. T.Maxworthy (Inst. fur Hydromech., Univ. Karlsruhe, Karlsruhe, Germany).
J. Fluid Mech. (GB), vol.128, p.247-57 (March 1983).
The authors have performed a series of experiments on two-dimensional gravity currents for which the inflow rate at the origin is a power-law function of time, $t^{\alpha-1}$. The theoretical results of Huppert (1982), for currents in which there is a balance between buoyancy and viscous forces, are found to be valid for a wide range of conditions. A large number of experiments at a critical value of $\alpha = {}^7/_4$ show very precise agreement with the theory, while values of a parameter that separates regions in which either viscous forces or inertial forces dominate are well within limits one would expect from the order-of-magnitude arguments used. (5 refs.)

71582 A ring-source/integral-equation method for the calculation of hydrodynamic forces exerted on floating bodies of revolution. A.Hulme (Dept. of Math., Univ. of Manchester, Manchester, England).
J. Fluid Mech. (GB), vol.128, p.387-412 (March 1983).
The wave forces exerted on a floating 3-dimensional body can be found by expressing the velocity potential of the surrounding fluid as the field of a distribution of point wave sources over the wetted part of the body surface. The problem then reduces to one of finding the solution to a 2-dimensional Fredholm integral equation of the second kind, to give the (unknown) surface source density. A simplification is possible for bodies that have a vertical axis of symmetry: for this type of body the author can distribute 'rings of sources' over the body surface, and the problem then reduces to the solution of 1-dimensional Fredholm equations of the second kind. This approach has been adopted before, but earlier work has made use of expressions for the fundamental ring-source potentials which are not always suitable for numerical computation. It is possible to derive many alternative expressions for the ring-source potentials, but it appears that no single expression is computationally convenient in every situation; the author discusses the computational merits of three different types of expression, the aim being to provide a comprehensive scheme for the evaluation of the ring-source potentials. The ring-source/integral-equation method is used to calculate the wave forces exerted on certain specific bodies of revolution and results are presented here. A brief discussion of the problem of 'irregular values' is also given: these only occur when the body intersects the free surface. (28 refs.)

71583 Wave modulation and breakdown. W.K.Melville (R.M. Parsons Lab., MIT, Cambridge, MA, USA).
J. Fluid Mech. (GB), vol.128, p.489-506 (March 1983).
Time series of amplitude, frequency, wavenumber and phase speed are measured in an unstable deep-water wavetrain using a Hilbert-transform technique. The modulation variables evolve from sinusoidal perturbations that are well described as slowly varying Stokes waves, through increasingly asymmetric modulations that finally result in very rapid jumps or 'phase reversals'. These anomalies appear to correspond to the 'crest pairing' described by Ramamonjiarisoa and Mollo-Christensen (1979). The measurements offer a novel local description of the instability of deep-water waves which contrasts markedly with the description afforded by conventional Fourier decomposition. The measurements display very large local modulations in the phase speed, modulations that may not be anticipated from measurements of the phase speeds of individual Fourier components travelling (to leading order) at the linear phase speed (Lake and Yuen 1978). (22 refs.)

71584 Waves due to a moving line impulse on the surface of a running stream of finite depth. B.Ghosh, K.S.Chaudhuri (Dept. of Math., Jadavpur Univ., Calcutta, India).
Meccanica (Italy), vol.18, no.1, p.16-20 (March 1983).
The two dimensional wave motion due to a line impulse moving on the surface of a running stream of finite depth is considered. The wave integral is evaluated for large times and distances with the help of generalized functions. Some particular cases are considered and some physical aspects of the wave motion are discussed. (4 refs.)

71585 Fluctuating hydrodynamics and capillary waves. M.Grant, R.C.Desai (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Phys. Rev. A (USA), vol.27, no.5, p.2577-84 (May 1983).
The authors derive an equation of motion for the instantaneous position of a planar liquid surface using fluctuating hydrodynamics. For the fluid constrained to be in a nonequilibrium steady state by a small temperature gradient, they then obtain the dynamic structure factor $S_{ss}(q, \omega)$, which represents the spectrum of thermal ripplons (capillary waves) on the liquid surface. The analysis is done for both classical and quantum fluids. The authors find that there is an asymmetry in the heights of the two ripplon peaks in $S_{ss}(q, \omega)$ due to broken time-reversal symmetry. The numerical estimates of the effect for liquid helium II, suggest that it could be measurable. They have undertaken a moment analysis of $S_{ss}(q, \omega)$; the first frequency moment is long ranged ($\sim 1/q^2$) in the steady state, though it vanishes in equilibrium. From the zeroth frequency moment they recover the familiar result for the infrared logarithmic divergence of the mean-square displacement of the interface; the analysis explicitly involves the coupling of the surface to the bulk fluid. They modify the so-called capillary-wave model by including the surface-bulk coupling, and thereby make it consistent with the capillary-wave dispersion. (25 refs.)

71586 Gravity waves in a channel with a rough bottom. R.Rosales, G.C.Papanicolaou (Courant Inst., MIT, New York, NY, USA).
Stud. Appl. Math. (USA), vol.68, no.2, p.89-102 (April 1983).
The effect of bottom irregularities on surface waves in a shallow channel can be analyzed rather well in the linear regime. This can be done by reducing the problem to the analysis of a one dimensional wave equation with random coefficients, which in turn can be studied in a number of different asymptotic limits. The authors study now nonlinearities due to finite amplitude surface disturbances interact with bottom irregularities to affect the evolution of the surface disturbances. They derive effective equations for the surface elevation of gravity waves in a shallow channel with a rough bottom. (4 refs.)

71587 Long eddies in sheared flows. E.Varley, P.A.Blythe (Lehigh Univ., Bethlehem, PA, USA).
Stud. Appl. Math. (USA), vol.68, no.2, p.103-87 (April 1983).
The characteristic feature of the wide variety of hydraulic shear flows analyzed is that they all contain a critical level where some of the fluid is turned relative to the ambient flow. One example is the flow produced in a thin layer of fluid, contained between lateral boundaries, during the passage of a long eddy. The boundaries of the layer may be rigid, or flexible, or free; the fluid may be either compressible or incompressible. A further example is the flow produced when a shear layer separates from a rigid boundary producing a region of recirculating flow. The equations used are those governing inviscid hydraulic shear flows. They are similar in form to the classical boundary layer equations with the viscous term omitted. The main result of the study is to show that when the hydraulic flow is steady and contained between lateral boundaries, the variation of vorticity $\omega(\psi)$ cannot be prescribed at any streamline which crosses the critical level. This variation is, in fact, determined by (1) the vorticity distribution at all streamlines which do not cross the critical level, by (2) the auxiliary conditions which must be satisfied at the boundaries of the fluid layer, and by (3) the dimensions of the region containing the turned flow. (10 refs.)

71588 Influence of the shape of a collapsing 'spot' and the fluid boundaries on internal wave formation in a stratified medium. V.I.Nikishov, A.G.Stetsenko (Inst. of Hydromech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.7, p.652-6 (July 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.7, p.93-7 (July 1982). [received: March 1983]
Examines internal wave formation by the collapse of a domain of homogeneous fluid ('spot') of different shape (circle, rectangle) in a stratified fluid of finite depth, and the influence of the shape of the domain and the closeness of the walls on the nature of this process is investigated. 71589 Asymptotic theory of flow separation from wings of low aspect ratio. S.B.Zakharov, G.G.Sudakov.
Fluid Dyn. (USA), vol.17, no.4, p.604-9 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.141-7 (July-Aug. 1982). [received: April 1983]
Numerous methods have been developed to calculate the aerodynamic characteristics of wings of low aspect ratio in the case when there is flow separation from the wing edges. Among the methods based on direct solution of the three-dimensional Euler equations there are the method of discrete vortices and the panel method. In addition, numerical and asymptotic methods based on the theory of slender bodies are used. One of the most important shortcomings of this theory is the dependence of the flow pattern at a given section of the wing on only the upstream flow. The authors construct an asymptotic theory of higher approximation and a corresponding numerical method for calculating flow separation from wings of low aspect ratio in which this shortcoming is absent. 71591 The two-dimensional oscillating airfoil: a new implementation of the galerkin method. W.F.Moss (Dept. of Math. Sci., Old Dominion Univ., Norfolk, VA, USA).
SIAM J. Numer. Anal. (USA), vol.20, no.2, p.391-9 (April 1983).
A new implementation of the Galerkin method is applied to the integral equation of Possio (1938), which arises in the study of oscillating airfoils. The novel feature here is the use of a partial difference equation to compute the coefficient matrix of the Galerkin system. The chebyshev polynomials used in previous work are replaced by airfoil polynomials. The error analysis of earlier work is applied, and numerical solutions are compared with the exact solutions of Kussner and Schwarz (1940) in the Mach number zero case. (15 refs.)

47.40H Transonic flows

71592 Numerical computation of transonic flows over airfoils and cascades. X.Zhou, F.Zhu (Northwestern Polytech. Univ., Xi'an, China).
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.37, no.3, p.277-88 (May 1983).
The transonic flows over airfoils and cascades are computed by means of othe time-dependent finite-volume method. The computed results are in good agreement with experimental data. The effect of applying a variable time step as large as is locally allowed by stability as well as a refined-mesh approach on the convergence rate are investigated. The authors adopt the requirement of constant stagnation enthalpy along a streamline instead of the energy equation in the governing equations, derive the stability conditions for the difference equation and find that the stability is improved. (8 refs.)

47.40K Supersonic and hypersonic flows

71593 High resolution submillimeter-wave radiometry of supersonic flow. G.F.Dionne, J.A.Wiess, J.F.Fitzgerald, H.R.Fetterman (Lincoln Lab., MIT, Lexington, MA, USA), M.M.Litvak.
Appl. Phys. Lett. (USA), vol.42, no.10, p.862-4 (15 May 1983).
The recent development of a high-resolution submillimeter-wave heterodyne radiometer has made possible the first measurements of H_2O molecule rotational line excitation temperatures and detailed profiles in supersonic flow. Absorption signals were measured across the flow for the $2_{11} \leftarrow 2_{02}$ (752 GHz) para-H_2O rotational transition against a hot background. These signals decrease downstream owing to the volume expansion of the gas away from the sonic nozzle exit in the high-vacuum chamber. Radiative transfer calculations based on the large-velocity-gradient approximation and multilevel statistical equilibrium agree with these results and with the measured spectral line shapes. The data reveal nearly isentropic gas expansion and cooling. These studies have shown that submillimeter-wave heterodyne radiometry can be useful for remote sensing of supersonic flow with low mass flux, provided the signal transmission is through a dry or thin atmosphere. (8 refs.)

71594 Wall pressure fluctuations in attached boundary-layer flow. A.L.Laganelli, A.Martellucci (Sci. Applications Inc., Wayne, PA, USA), L.L.Shaw.
AIAA J. (USA), vol.21, no.4, p.495-502 (April 1983).
An examination has been made to derive a correlation for an aeroacoustic environment associated with attached compressible flow conditions. It was determined that fluctuating pressure characteristics described by incompressible theory as well as empirical correlations could be modified to a compressible state through a transformation function. Compressible data were transformed to the incompressible plane where direct use of more tractable prediction techniques are available for engineering design analyses. The investigation centered on algorithms associated with pressure magnitude and power spectral density. The method and subsequent prediction techniques are shown to be in excellent agreement with both incompressible and compressible flow data. (22 refs.)

71595 Similarity of the flow of strongly underexpanded gas jets exhausting into a hypersonic flow. G.A.Khramov, S.F.Chekmarev.
Fluid Dyn. (USA), vol.17, no.4, p.580-7 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.113-20 (July-Aug. 1982). [received: April 1983]
The authors consider an underexpanded jet exhausting into an ambient flow under the general conditions: $M_c^2 \gg 1$, $\theta_c^2 \ll 1$, $M_\infty^2 \gg 1$, $n \gg 1$. M_c and M_∞ are the Mach numbers at the nozzle exit and in the ambient flow, θ_c is the nozzle's half-angle and n the pressure ratios p_c/p_∞. They assume that the gas is an ideal fluid and that the shock waves and boundary of the jet are surfaces of discontinuity. (9 refs.)

71596 Computation of hypersonic viscous flow over a body with mass transfer and/or spin. M.D.Kim (Dept. Aerospace & Ocean Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA), C.H.Lewis.
J. Spacecr. & Rockets (USA), vol.20, no.2, p.101-7 (March-April 1983).
Computational results of hypersonic laminar viscous flow over blunt-nosed bodies with mass transfer and/or spin are presented. An implicit-iterative numerical scheme at each marching step is used to solve the parabolized Navier-Stokes equations. The code takes into account the mass-transfer and spin effects in the boundary conditions at the body surface and the periodic effect in the boundary condition around the body. To facilitate convergence, the v-momentum equation has been used rather than the continuity equation to provide the pressure at the body boundary. The coupled effects of mass transfer and spin on the Magnus force and surface measurable quantities were substantial. (12 refs.)

47.40N Shock-wave interactions

71597 On regular reflection of a shock wave from a rigid wall. V.M.Teshukov.
Appl. Math. & Mech. (USA), vol.46, no.2, p.167-74 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.225-34 (1982).
The three-dimensional problem of reflection of a shock wave of arbitrary front shape from a fixed rigid wall is considered. Existence of a piecewise analytic solution of the problem defining the initial stage of regular reflection is proved. Expansion of solution behind the reflected wave front in converging power series in the neighborhood of the incident wave (of the moving along the wall intersection line of the incident wavefront and the rigid wall) is obtained for prolonged instants of time. It is shown that such expansions generally occur only then, when the length of the trace velocity vector relative to gas behind the reflected wave projected on the plane normal to the trace exceeds the speed of sound. (5 refs.)

71598 The inversion of a spherical compression wave in fluid. V.N.Likhachev.
Appl. Math. & Mech. (USA), vol.46, no.2, p.175-9 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.235-40 (1982).
The spherically symmetric motion of fluid under the action of a spherical piston is considered. The method of merging asymptotic expansions in a small parameter which defines the low compressibility of fluid is used. The inversion of a compression wave is investigated. The point of inversion is determined and the asymptotics of solution in its neighborhood, which replaces the initial condition for shock wave construction, is obtained. (3 refs.)

71599 Spherically-symmetric shock wave in a dilatant medium. S.G.Artyshev, E.K.Bokovaia, V.A.Bokovoi.
Appl. Math. & Mech. (USA), vol.46, no.2, p.271-4 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.2, p.349-52 (1982).
The problem is examined of the expansion of a spherical region filled with a gas with high initial pressure, in a continuous medium with dilatancy, by which is meant the kinematic connection between the velocities of the dilatational and the maximal tangential deformations. The change in the medium's density behind the shock wave's front takes place only due to this kinematic connection. The model given was previously used mainly for describing the behavior of certain soils in an underground explosion. The soil density behind the shock wave's front had been reckoned to be constant. An analogous problem is examined in the case when the dilatancy velocity coefficient is a piecewise-constant function of the medium's density. (6 refs.)

71600 Shocks in gas pipelines. D.Marchesin (Dept. de Matematica, Pontifica Univ. Catolica do RJ, Rio de Janeiro, Brazil), P.J.Paes-Leme.
SIAM J. Sci. & Stat. Comput. (USA), vol.4, no.1, p.105-16 (March 1983).
The uniform sampling method to study shocks and spikes in transient flow in gas pipelines. The method is well suited for this purpose. Both shocks and spikes tend to be masked by the use of a conventional damping term known as Moody friction. They are also masked by standard numerical schemes. (18 refs.)

71601 Absorption waves in gases. I.V.Nemchinov (Inst. of Earth Phys., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.6 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.6, p.1026-36 15-24 (1982). [received: April 1983] (Proceedings of the Fifth All-Union Conference on Nonresonant Interaction of Optical Radiation with Matter, Leningrad, USSR, 1-4 Dec. 1981).
The propagation of absorption waves in the opposite direction to the laser beam is considered (subsonic and supersonic radiation waves and also light-detonation ones). Simple models are presented that describe the basic parameters of these waves, along with results from detailed numerical calculations. A comparison is made with experiment. (46 refs.)

71602 Forces exerted by a weak shock wave on a wing of complicated shape in plan at supersonic velocities. M.I.Nisht, A.F.Polovkov, S.A.Popytalov.
Fluid Dyn. (USA), vol.17, no.4, p.587-92 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.121-7 (July-Aug. 1982). [received: April 1983]
A method is presented for calculating the supersonic distributed and total aerodynamic characteristics of a wing of complicated shape in plan, including a wing having the shape of an aircraft in plan which encounters a weak shock wave of arbitrary orientation: The problem is solved in the linear formulation. (6 refs.)

71603 Invariant solutions of the equations of motion of ionized gas. N.S.Zakharov, V.P.Korobeinikov (V.A. Stekiov Math. Inst., Acad. of Sci., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.2, p.929-32 (Aug. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.2, p.299-303 (Aug. 1982). [received: April 1983]
Group analysis of the equations of motion of ionized gas heated by external radiation is performed. The problem of self-similar flow of completely ionized gas is solved numerically. (5 refs.)

71604 Effects of radius of curvature and initial angle on the shock transition over concave or convex walls. K.Takayama (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan), M.Sasaki.
Rep. Inst. High Speed Mech. Tohoku Univ. Ser. B (Japan), vol.46, p.1-30 (1983).
The effects of radii of curvature and initial angles of concave or convex walls on the shock transition in truly non-stationary flows are investigated experimentally. Experiments were conducted on concave or convex walls with radii of curvature 20 mm to 300 mm for nitrogen at 1.0-100 KPa and shock Mach number 1.05-4.0 by using a 40 mm×80 mm shock tube equipped with a double exposure holographic interferometer and a streak camera with curves slits. It is revealed that in concave walls with larger radii of curvature the shock transition angle from Mach reflection to regular reflection (MR→RR) approaches the von Neumann criterion, whereas in convex walls with larger radii of curvature the shock transition angle from regular to Mach reflection (RR→MR) approaches to the detachment criterion. The effect of the initial angles becomes prominent in the convex wall but less sensitive in the convex wall. Isopycnic curves evaluated from the holographic interferograms are presented showing the hysteresis between the transition over concave and convex walls. The hysteresis in the MR⇄RR transition was very well interpreted by a multiple shock polar diagram. (16 refs.)

71605 Calculation of gas-dynamic parameters in the neighborhood of bodies in free-molecule streams. V.P.Bass, V.I.Brazinskii.
Fluid Dyn. (USA), vol.17, no.4, p.641-3 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.177-80 (July-Aug. 1982). [received: April 1983]
Considers the free-molecule flow of a rarefied gas past an arbitrary convex fixed body in the absence of external forces. The undisturbed flow is assumed to be an equilibrium flow with Maxwellian velocity distribution function of the molecules. (5 refs.)

71606 Dependence of tagged-particle motion on size and mass. A.J.Masters, T.Keyes (Sterling Chem. Lab., Yale Univ., New Haven, CT, USA).
Phys. Rev. A (USA), vol.27, no.5, p.2603-15 (May 1983).
Tagged-particle motion in fluids is studied as a function of size and mass via variational solutions of the repeated-ring and self-consistent repeated-ring equations. For a massive particle, the transition from Boltzmann to Stokes-Einstein behavior is found as the particle radius varies from small to large with respect to the mean free path. New and more complicated effects are found for light particles. The theory appears to provide an explanation of the results of the computer simulation of Alder and Alley (1978) on size and mass dependence. (18 refs.)

71607 Internal variables and the thermodynamics of macromolecule solutions. G.A.Maugin, R.Drouot (Lab. de Mecanique Theorique, Univ. Pierre et Marie Curie, Paris, France).
Int. J. Eng. Sci. (GB), vol.21, no.7, p.705-24 (1983).
In the modelling of the anomalous behavior of the flow of deformable macromolecules one recognizes the fact that the peculiarities of this flow are typically due to the deformability of the said molecules. In a continuum thermodynamical description this structural deformation can be conveniently characterized by means of a quantity which may be a scalar, a vector or a tensor, and is considered as a so-called internal variable in the sense that it satisfies a time-evolution equation while the global thermodynamical behavior of the solution is still governed by the usual balance laws of continuum thermomechanics. Two cases are presented: (i) one for dilute polymer solutions where the internal variable is a symmetric second-order tensor (practically, the mean inertia of entangled molecules); (ii) another one in which the internal variable is a vector (which represents the mean extensional molecular deformation) and which aims at reproducing the behavior of rodlike macromolecules (as in charged polyelectrolytes) and which, combined with a finer kinematical description in the fluid flow, allows for the existence of remarkable migration phenomena. (62 refs.)

71608 Drag reduction and mechanical degradation in polymer solutions in flow. W.Brostow (Dept. of Materials Engng., Drexel Univ., Philadelphia, PA, USA).
Polymer (GB), vol.24, no.5, p.631-8 (May 1983).
A list of conclusions from experimental studies of drag reduction (*DR*) and mechanical degradation in flow (*MDF*) is made. A statistical-mechanical model of chain conformations developed by the author (1982) is used and its consequences for *DR* and *MDF* established. Experimental findings are explained in terms of the model, including those considered to be puzzling and contrary to expectations. A relation between the extent of mechanical degradation and flow time is derived. The equation obtained for relative drag reduction in function of time reproduces perfectly the experimental data for polystyrene+toluene solutions reported by Hunston and Zakin (1980). Some predictions from the present model have yet to be tested experimentally. (57 refs.)

71609 Studies of bubble behavior and non-Newtonian viscosity of polymer solutions. I.. A.Shima (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan), T.Tsujino, J.Tanaka.
Rep. Inst. High Speed Mech. Tohoku Univ. Ser. B (Japan), vol.46, p.103-29 (1983).
In order to make clear the bubble behavior of polymer solutions, rheological properties of PEO (polyethylene oxide) solutions and PAM (*N*-110) (polyacrylamide) solutions are experimentally analysed by using a rheometer of cone and plate type, and then a rheological equation is proposed. By utilizing the result, the equation of motion for a bubble and the pressure equation are theoretically obtained. According to numerical calculations of the derived equations, the effects of a polymer concentration and a size of initial bubble radius on the relation of bubble radius-time and the maximum impulse pressures occurring from the bubble are clarified. (24 refs.)

71610 Studies of bubble behavior and non-Newtonian viscosity of polymer solutions. II.. T.Tsujino (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan), A.Shima.
Rep. Inst. High Speed Mech. Tohoku Univ. Ser. B (Japan), vol.46, p.131-51 (1983).
For pt.I see ibid., vol.46, p.103 (1983). Taking up Polyox and PAM (*A*-20*P*) as polymer additives, rheological characteristics for these polymer solutions are experimentally analysed as a continuation of a previous report of the same title. As a result, it is found that the rheological behavior of these polymer solutions are well represented by the rheological model proposed in the previous paper. Then numerical calculations are conducted for the bubble behavior and the impulse pressure in Polyox solutions and PAM (*A*-20*P*) solutions. An experimental equation which represents the relation of surface tension of polymer solutions with polymer concentration is made. (3 refs.)

71611 Studies of bubble behavior and non-Newtonian viscosity of polymer solutions. III.. T.Tsujino (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan), A.Shima.
Rep. Inst. High Speed Mech. Tohoku Univ. Ser. B (Japan), vol.46, p.153-80 (1983).
For pt.II see ibid. vol.46, p.131 (1983). By analysing experimentally rheological characteristics of carboxymethylcellulose solutions and hydroxyethylcellulose solutions it is found that the rheology of these polymer solutions are well represented by a rheological model proposed in a previous paper. The motion of a bubble and impulse pressures in these polymer solutions are numerically made clear, which are compared with the cases of polyethylene oxide solutions and polyacrylamide solutions considered in the previous reports. As a result, it is clarified that PAM (*N*-110) is the most effective polymer on a decrease of impulse pressure, that the polymer effects in PEO solutions and CMC-4H solutions are comparatively large, and that the decreasing rates of impulse pressure in Polyox solutions, CMC-BS solutions, and HEC solutions are less than the other polymer solutions. Measurement for the surface tensions of CMC solutions and HEC solutions is also made. (15 refs.)

71612 On the behavior of bubbles in viscoelastic fluids. I. A.Shima (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan), T.Tsujino, J.Tanaka.
Rep. Inst. High Speed Mech. Tohoku Univ. Ser. B (Japan), vol.46, p.181-98 (1983).
By using the Oldroyd model proposed by Williams and Bird (1962), the equation of motion for a bubble and the pressure equation were obtained, and then examples of numerical calculations were shown for the bubbles in a 4.0% CMC solution and a 0.025% SPM solution. Consequently, viscoelastic polymer effects on the variation with time of the bubble radius and the impulsive pressure occurring from the bubble were made clear. (15 refs.)

71613 Experimental measurements of the effect of viscosity on drag for liquid drops. P.H.Gillaspy, T.E.Hoffer (Desert Res. Inst., Univ. of Nevada System, Reno, NV, USA).
AIChE J. (USA), vol.29, no.2, p.229-36 (March 1983).
The drag coefficients of drops of various liquids falling in air were measured experimentally. The drag coefficient was linearly related to the viscosity in the Reynolds number and viscosity range measured. Measurements also suggested there is no difference between Newtonian and nonNewtonian liquids. (23 refs.)

71614 Equilibrium shapes and stability of rotating drops. V.A.Arkhipov, V.P.Bushlanov, I.M.Vasenin, V.V.Rusakov, V.F.Trofimov.
Fluid Dyn. (USA), vol.17, no.4, p.498-504 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.13-20 (July-Aug. 1982). [received: April 1983]
Direct variational methods are used to obtain nonaxisymmetric equilibrium shapes of a rotating drop. The results are given of experiments on the interaction of freely floating drops of viscous fluid. It is shown that if the dimensionless angular momentum of the system is $\Omega > 3.4$, then a sequence of three-dimensional shapes similar to ellipsoids bifurcates from the sequence of axisymmetric shapes. The stability of these shapes is studied in Poincare's scheme. (8 refs.)

71615 Motion of a drop with allowance for thermocapillary forces. V.Ya.Rivkind, G.S.Sigovtsev.
Fluid Dyn. (USA), vol.17, no.4, p.554-9 (July-Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.4, p.80-6 (July-Aug. 1982). [received: April 1983]
A study is made of the motion of a drop in a viscous medium of nonuniform temperature when the dependence of the surface tension on the temperature at the interface of the two media gives rise to additional tangential stresses leading to thermocapillary convection in fluids. The motions of a spherical drop and a deformed drop (when the surface of the drop is determined in the process of finding the solution) are considered. The shape of the drop surface is calculated for different values of the parameters of the problem. Dependences are obtained for the Reynolds number of the thermocapillary drift of drops in the absence of body forces. (13 refs.)

47.55B Cavitation

71616 Singular behavior of cavitation in undersaturated water. R.Oba (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan), K.T.Kim, K.Uranishi.
Rep. Inst. High Speed Mech. Tohoku Univ. Ser. B (Japan), vol.46, p.75-88 (1983).
In order to clarify the effects of contained air in water upon cavitation, especially in the range from the inception to the desinence, the cavitation-aspects, the associated sound-pressures as well as wall-pressure-fluctuations, and the nuclei size-distribution of test-water are simultaneously observed in the water-flow through an orifice, for various state of water, in which the degree of air-saturation covers from undersaturation to oversaturation. A drastic change in the aspects is clearly observed, with respect to the degree of saturation, i.e. either at undersaturation or at oversaturation, even when the cavitation-nuclei are almost equivalent to each other. (14 refs.)

71617 Cavitation aspects in a Venturi ('Johnsson effects' in a low turbulence flow). R.Oba, Y.Ito (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan).
Rep. Inst. High Speed Mech. Tohoku Univ. Ser. B (Japan), vol.46, p.89-102 (1983).
Recently, the appearance of incipient cavitation was quite differently observed on the ITTC standard body, a kind of axisymmetric body, in different cavitation tunnels widely distributed in the world, even when the cavitation number as well as the Reynolds number was fixed. It is, therefore, recognized by the authors as if the so-called Johnsson effects required the reexamination of the several existing results on cavitation. The cavitation aspects and the shock sound pressures were carefully investigated in a typical internal flow through a Venturi, in which the turbulence intensity was expectedly low and the flow was principally characterized by the shear as well as the vortices. Several results show that the controlling factors of the Johnsson effects were obtained not only in desinent cavitation but also in well-developed cavitation. (12 refs.)

47.55C Jets

71618 Viscous stability of compressible axisymmetric jets. P.J.Morris (Pennsylvania State Univ., University Park, PA, USA).
AIAA J. (USA), vol.21, no.4, p.481-2 (April 1983).
Calculations of the viscous, spatial stability characteristics of a compressible axisymmetric jet are presented. The asymptotic solutions to the stability equations in regions of constant mean flow properties are developed and used as the boundary conditions for a numerical integration of the compressible stability equations in cylindrical coordinates. Increasing the Mach number is found to stabilize the flow, as is decreasing the Reynolds number. The helical mode is found to be more unstable than the axisymmetric mode for higher Mach numbers. (8 refs.)

71619 Numerical calculations of steady three-dimensional turbulent jets in cross flow. A.O.Demuren (Sonderforschungsbereich, Univ. Karlsruhe, Karlsruhe, Germany).
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.37, no.3, p.309-28 (May 1983).
Presents calculations of the steady flow of a row of turbulent jets issuing normally into a nearly uniform cross flow, using three-dimensional finite-difference numerical procedures. One procedure uses a quadratic upstream weighted (QUICK) difference scheme in representing the convection terms, while the other uses a hybrid central/upwind difference scheme. The calculations with the former are shown to be superior to those with the latter for all grid distributions. Fine grid calculations with the QUICK scheme are shown to agree fairly well with experimental measurements of total pressure distributions immediately downstream of the jet discharge. The agreement becomes worse further downstream, and it is shown that this may be due to the inability of the k-ϵ turbulence model to correctly reflect the complex turbulent structure in the wake region. Estimates are provided to the relative magnitudes of the three-dimensional false or numerical diffusivities, resulting from the use of upwind differencing. The QUICK and hybrid schemes are shown to produce closer results when these false diffusivities are not much higher than the physical diffusivity. (23 refs.)

71620 Jets into liquid under gravity. D.D.Joseph, K.Nguyen (Dept. of Aerospace Engng. & Mech., Univ. of Minnesota, Minneapolis, MN, USA), J.E.Matta.
J. Fluid Mech. (GB), vol.128, p.443-68 (March 1983).
The authors study the flow of a heavy, viscous, possibly non-Newtonian axisymmetric jet of liquid of density ρ falling under gravity g into a lighter liquid of density $\tilde{\rho}$. If the change in the momentum of the entrained lighter liquid is neglected the jet will ultimately reach a modified Torricelli limit with a speed given by $U(x)=[2(\delta\rho/\rho)gx]^{1/2}$ and an asymptotic radius $a(x)=[2Q^2/(\delta\rho/\rho)gx]^{1/4}$, where x is the downstream distance, $\delta\rho=\rho-\tilde{\rho}>0$ and $2Q$ is the volume flow. An exact asymptotic solution perturbing the Torricelli limit with effects of surface tension, viscosity and elasticity is given in powers of $x^{-1/4}$. An extended unsteady problem including effects of entrainment is formulated in terms of nonlinear ordinary differential equations which also account for weak radial variations of the velocity across the cross-section of the jet. (10 refs.)

71621 Experimental investigation of a turbulent jet in turbulent cross flow. L.N.Voitovich.
